In April last, I had a hen which hatched chickens; and after the usual time, which hens provide for their young, she left them, made herself a nest in the bushes about forty rods from the house, over which I made a shelter, and she hatched in September. The hen continued about her nest, where she was fed, five or six days, at which time she was missing, supposed to be taken by some wild animal. I found the little disconsolate brood huddled together as in sympathy, lamenting their hapless condition. The chickens were then taken home and confined with one of the former pullets, hatched in April which had a broken leg. She soon became fond of the little ones, clucked like an old hen, fed and brooded them, and continued to call them after her until they were enabled to provide for themselves, although their young adopted mother, had never laid an egg; by which means the little chicks were brought to maturity.

CAROLUS.

Borford, January 16, 1824.

To the Editor of the New England Farmer.
INQUIRY.

SIR,—I have worked at the Blacksmith's trade for thirty years past, and have been more or less troubled with the smoke of the Sea Coal which I use, when my shop is closed and I have a fire in a cast iron stove, which is necessary in cold weather to warm the shop—My throat (and that of my man) feels as when I have a cold—and a kind of hacking which continues thro' the night—I am not troubled with it when the doors are open, and very little except when we have a fire in the cast iron stove. I hope some of your correspondents will inform me if I am endangering my health or that of my workman by heating the shop, and if there is any remedy—if no remedy but to open the doors I will do it. I had rather freeze than suffocate. VULCAN.

[Placing a dish full of water on the stove will give by its gradual evaporation a degree of elasticity to the air, and afford at least a partial remedy to the evil complained of.]

THE VARIOLOID* EPIDEMIC.

Dr. J. K. Mitchell, of Philadelphia, one of the physicians of the Alms House and Small Pox Hospital, has published a statement founded on his observation and that of Dr. John Bell, which exhibits very strongly the value of vaccination, as a protection against the fatal effects of this disease, although it shows at the same time that it does not entirely prevent the recurrence of the disease. The statement embraces 113 cases of small pox, or varioloid, which have lately occurred at Philadelphia. Of these, 43 occurred in persons who had previously had the vaccine disease and no one died. Eight cases occurred in persons who had previously had the small pox, and of this number four died. The other 93 cases occurred in persons who had previously had neither disease, and of these 32 died and 41 recovered. Two of the persons who had the small pox a second time, took it naturally the first time.—Eight of those who took the disease after the vaccine, had been vaccinated recently. Some of the mildest cases were in persons who were vaccinated more than twenty years ago.

A variety of the Small Pox, but of a milder type.

AGRICULTURAL ADDRESSES.

We have been favored with copies of several Addresses delivered during the last autumnal exhibitions of New England societies. These are not only excellent in themselves as vehicles of information not only to Agriculturists, but to persons of all professions and occupations, but they afford pleasing and conclusive evidence that the public mind is taking a right direction, and that our first characters, and men of the greatest intellectual powers are devoting their energies to the improvement of Agriculture. We should be glad to give these Addresses at large, but as they have been already printed, extensively circulated, and to be obtained by most of our readers through other channels, we have thought it advisable to confine ourselves to the republication of such extracts as convey the most important practical truths. This plan we are sensible will compel us to omit many passages, which we ad-

miere. But, as it is expected that we should contribute our might to original matter to the mass of information already before the public, we are constrained to exclude from our columns many meritorious productions, in order to make room for communications, which are written expressly for this paper, and are recommended as well by their novelty as by their utility.

PARING AND BURNING.

We have had repeated calls for information on the subject of paring and burning the surface of soil for the purpose of increasing its fertility, and are disposed to answer those ends to the extent of our ability. Sir Humphrey Davy says, "It is obvious that in all cases paring and burning the soil must destroy a certain quantity of vegetable matter, and must be principally useful in cases in which there is an excess of this matter in soils. Burning, likewise renders clays less coherent, and in this way greatly improves their texture, and causes them to be less permeable to water.

"The instances in which it must be obviously prejudicial, are those of sandy dry siliceous soils, containing little animal or vegetable matter. Here it can only be destructive, for it decomposes that on which the soil depends for its productiveness.

"The process of burning renders the soil less compact, less tenacious and retentive of moisture; and when properly applied may convert a matter that was stiff, damp, and in consequence cold, into one powdery, dry, and warm; and much more proper as a bed of vegetable life.

"The great objection made by speculative chemists to paring and burning, is, that it destroys vegetable and animal matter, or the manure in the soil; but in cases in which the texture of its earthy ingredients is permanently improved, there is more than a compensation for this temporary disadvantage. And in some soils where there is an excess of inert vegetable matter, the destruction of it must be beneficial, and the carbonaceous [coaly] matter remaining in the ashes may be more useful to the crop than the vegetable fibr., from which it was produced.

"Many obscure causes have been referred to for the purpose of explaining the effects of paring and burning; and I believe they may be referred entirely to the diminution of the coherence and tenacity of clays, and to the destructions of inert, and useless vegetable matter, and its conversion into a manure.

"All soils that contain too much vegetable fibre, and which consequently lose from one third to one half of their weight by incineration, [burning] and all such as contain their earthy constituents in an impalpable state of division, i. e. the stiff clays and marls, are improved by burning; but in the coarse sands, or rich soils containing a just mixture of the earths; and in all cases in which the texture is already sufficiently loose, or organizable matter sufficiently soluble, the process of burning cannot be useful.

"All poor siliceous sands must be injured by it; and here practice is found to accord with theory. Mr. Young, in his Essay on Manures, states, "that he found burning injured sand;" and that the operation is never performed by good agriculturists upon siliceous sandy soils, after they have once been brought into cultivation.

"An intelligent farmer in Mount's Bay told me, that he had pared and burned a small field several years ago, which he had not been able to bring again into good condition. I examined the spot, the grass was very poor and scabby, and the soil an arid siliceous sand."

(To be continued.)

LIST OF AGRICULTURAL BOOKS, FOR SALE BY THE PRINCIPAL BOOKSELLERS IN BOSTON.

[Continued from page 198.]

Davy's Agricultural Chemistry.—Charles Ewer; Samuel T. Armstrong; Richardson & Lord.
Domestic Cookery.—Charles Ewer.
Domestic Encyclopedia.—Charles Ewer.
Every Man his own Cattle Doctor. By FRANCIS CUTTER.—Richardson & Lord.
Farmer's Dictionary.—R. P. & C. Williams.
Farmer's Assistant. A Digest of all that relates to agriculture and the conducting of Rural Affairs. Charles Ewer; R. P. & C. Williams; Cummins, Hilliard, & Co.
Forsyth on Fruit Trees.—R. P. & C. Williams; Wells & Lilly; Cummings, Hilliard, & Co.
General Report of the Agricultural state and Political Circumstances of Scotland. By Sir JOHN ERSKINE.—R. P. & C. Williams.
Hagber's Treatise on the Culture of the Strawberry, Raspberry, and Gooseberry.—R. P. & C. Williams.
Husbandman and Housewife.—Charles Ewer.
Horse, Hockney Husbandry. or A Treatise on the Principles of Tillage and Vegetation, wherein is taught Method of introducing a sort of Vineyard Culture to the Corn Fields, in order to increase their Product and diminish the Common Expense. By JETHU TULL.—To which is prefixed, An Introduction, explanatory of some Circumstances connected with History and Division of the Work; and containing an Account of certain Experiments of recent date. By WILLIAM CORBETT.—Wells & Lilly.
Management of Bees.—Charles Ewer.
Marshall's Gardening.—Charles Ewer.
Massachusetts Agricultural Repository.—Wells & Lilly; Cummings, Hilliard, & Co.
Memoirs of the Philadelphia Agricultural Society. vols. 3 mo.—R. P. & C. Williams.
New England Farmer, or Geographical Dictionary; containing a compendious Account of the Ways and Methods in which the important Art of Husbandry, all its various Branches is, or may be practiced to the greatest advantage in this country. By SAMUEL DEANE, D. D. Third Edition; corrected, improved and enlarged; and adapted to the present state of the Science of Agriculture.—Wells & Lilly; Cummings, Hilliard, & Co.
N. B. The price of the N. E. Farmer has been reduced from \$3 to \$2.
Nuttall's Botany, or the Genera of North American Plants, and a Catalogue of the species, to the year 1817.—Wells & Lilly.
Thatcher's American Orchardist; or A Practical Treatise on the Culture and Management of the Apple and other Fruit Trees, with Observations on the Diseases to which they are liable, and their Remedies. To which is added the most approved Methods of Manufacturing and Preserving Cider. Compiled from the latest and most approved Authorities, and adapted to the use of American Farmers.—Cummings, Hilliard, & Co.; Richardson & Lord.

A new Year's Gift.—At the commencement of the New Year, the members of Rev. Mr. Bacon's Society in Abhy, presented at his door, among other valuable presents, nearly forty cords of excellent wood. Some of the loads were of extraordinary size; but the last was a "Mammoth," indeed. Its width 8 and a half feet—its length fourteen and a half—its height a little over twelve feet; producing an aggregate of almost twenty cords! The load was composed entirely of hard wood—most of it birch and maple. There were thirty-seven pair of cattle in the team.

Small Pox not in Boston.—A meeting of the General Vaccinating Committee of Boston, was held on the 20th inst. in which it was voted and unanimously declared, that no instance has occurred within this city of the Small Pox, within the knowledge or belief of any member of the Committee. And that our country brethren be assured that the Ward Committees of vaccination have visited, within the last ten days, every family in the city, and that there is no foundation whatever for such reports. And that a vigorous system of vaccination being now in progress in every Ward, the Committee trust, under Providence, that the city will be preserved from this great calamity.

HYMN.

There's not a tint that paints the rose,
Or decks the lily fair,
Or streaks the humblest flower that grows,
But Heaven has placed it there!

At early dawn there's not a gale,
Across the landscape driven,
And not a breeze that sweeps the vale,
That is not sent by Heaven.

There's not of grass a simple blade,
Or leaf of lowliest meim,
Where heavenly skill is not displayed,
And heavenly wisdom seen!

There's not a tempest dark and dread,
Or storm that rends the air,
Or blast that sweeps o'er ocean's bed,
But Heaven's own voice is there!

There's not a star whose twinkling light
Illumes the distant earth,
And cheers the solemn gloom of night,
But mercy gave it birth!

There's not a cloud whose dew distil
Upon the parching clod,
And clothe with verdure vale and hill,
That is not sent by God!

There's not a place in earth's vast round,
In ocean deep or air,
Where skill and wisdom are not found!
For God is every where!

Around, beneath, below, above,
Wherever space extends,
There Heaven displays its boundless love,
And power with mercy blends!

Then rise, my soul and sing His name,
And all his praise rehearse,
Who spread abroad earth's glorious frame,
And built the universe!

Where'er thine earthly lot is cast,
His power and love declare,
Nor think the mighty theme too vast—
For God is every where!

MISCELLANY.

From the London Farmer's Journal.

Simulated Death.—From its singularity, we are induced to give the particulars of this case, which was shortly noticed in our last.

"A very extraordinary case of this nature occurred a few days ago, at Hammersmith, in the person of Harriet Smith, a young woman of interesting appearance, who served as housemaid in the family of Robert Emerson, Esq. of Oxford-street. This girl, it seems, had, about three years ago, been thrown from the top of a stage-coach, and received many severe contusions both internal and external, which seriously affected her strength, and brought on a gradual decay of nature. Being incapable of performing her customary business, she relinquished her situation, and obtained an asylum beneath the roof of a female relative at Hammersmith. Here, notwithstanding her total cessation from all corporal labor, her complaint still advanced; she every day grew weaker, and was frequently subject to long faintings. Through the

kind attentions of some ladies with whom she had formerly lived, every aid that eminent professional advice could afford, was rendered her, with a constant supply of such necessities and comforts as her helpless situation demanded.—On Thursday week she had been taken out for an airing, and returned home with renewed strength, in rather better spirits than usual.—After taking some refreshment, she complained of excessive inclination to sleep, and was therefore placed in bed between the hours of six and seven in the afternoon. In apparent enjoyment of profound repose, she remained until a very far advanced hour the following day, when on attempting to arouse her, she was found to be quite cold; her lips were colorless, and her eyes glazed; all pulsation had ceased; every thing bore testimony to the power of the destroyer death. The last offices to her remains which were directed by decency, were then performed; the corpse was attired in the usual grave clothes, and laid on a bed, where it remained from Friday noon until Sunday morning, the afternoon of which day was fixed for the interment. Happily, however, the horrible event, which we fear occurs but too often, was frustrated. On the removal of the body from the bed to the coffin, one of the persons engaged, inadvertently placed her hand on the bosom, and fancying its touch imparted a sensation far more warm than the damp and clayey feel of a corpse, she naturally expressed her opinion to those who were assisting in the melancholy office; a closer examination convinced them that they were about to commit to the cold grave a living subject. The cheeks and lips were still livid and colorless; the eye exhibited no sensation of vision, but the vital principle reigned about the region of the heart, and on the application of a glass, breathing was once more perceptible. The physician who had attended during her illness was instantly sent for; on his arrival signs of returning animation were so manifest, that he concluded bleeding and the application of warm bricks would be productive of immediate restoration. He therefore opened a vein, first in one arm and then in the other, but without effect; every other effort proved equally unavailing, until about five o'clock in the evening, when a rapid change took place; the throbbing of the heart and pulse became audible, the cheeks and lips partially regained their crimson, respiration returned with ease and vigor, and in a few moments all the animal powers assumed their functions. During the interesting interval the various insignia of death were removed in order that she should not be terrified by their appearance when perception returned;—but being questioned as to her health in the customary manner, she manifested no knowledge of what her situation had been, merely saying that she felt cold and weak, with an extraordinary oppression and sensation of fear, not unlike that which is experienced in dreams, when afflicted with the complaint commonly called the nightmare. She has improved not only in health but in spirits every day since her visit to the other world, and is now likely to be long an inhabitant of this.

Love of Fame.—The love of fame not regulated by principle, is more dangerous to the welfare of society than the love of money.

From the Massachusetts Yeoman.

MR. DENNY.—Your correspondent, "R." has been safe in his calculations respecting the number of hands employed in the manufacture of Straw Goods, and the amount received for them when the business produced a profit to manufacturers. I have heard it observed by those who were acquainted with the business that the sales of Bonnets and Trimmings manufactured in this State, have amounted to more than a million of dollars yearly. It is to be regretted that this branch of our Manufactures which assists such a proportion of the industrious poor, should be done away with, to give place to a foreign substitute, which, by some L. of taste, is said not to excel in beauty the Straws manufactured with us. It has been that the American Straws are not so durable as the Leghorn. This will be admitted; but we consider that the American Straw Bonnet worth \$6 will last three or four years, an main as handsome as the Leghorn that cost used the same length of time, we, as purchasers for the Ladies, are ready to decide that American straw should have the preference.

It appears to me, those engaged in the manufacture of this article have not paid that attention to fine Bonnets, which their interest requires. It is now difficult for a Lady to procure a nice American Straw Bonnet.—Should the manufacturer turn his attention to Bonnets from \$3 to \$10, it is thought he would have a quick sale and soon be remunerated for the trouble he necessarily must be at in producing the fine platt. Let the Ladies have an opportunity of wearing fine American Straws if they are censured for wearing an article in because it is "far fetched."

ANECDOTES.

A young man having entertained a tenderness for a young woman felt such unbecoming diffidence as to prevent his ever disclosing the same to the fair empress of his heart, and on an expedient which would bring the matter to an issue. He went to the clergyman and requested the bands of marriage might be published, according to law. When the ceremony was brought to her ears, she was with astonishment and went to him to vent her resentment; he bore the sally with fortitude observing that if she did not think proper to have him he could go to the clergyman and bid the bans. After a moment's pause, she, in her anger and said "as it has been decided it is a pity that a shilling should be thrown away."

Dr. Warner happening to be in a shop the Duchess of Portland came in and ordered a hundred pens, said that he had written the *ecclesiastical History of England*, two volumes wholly with one pen, which he still had in his hand. The Duchess hearing this, and being a collector of all kinds of curiosities, begged the Doctor, and caused it to be enclosed in a paper case, on which is an inscription recording his labors.

Facts and Observations relating to Agriculture and Domestic Economy.

[BY THE EDITOR.]

ON THE USE OF SALT AS A MANURE.

[Continued from page 202.]

"Gervase Markham, a learned writer in the reign of James the 1st and Charles the 1st, who was equally noted for his skill in many foreign languages, and for his knowledge of the various branches of agriculture, published a great variety of treatises on the management of land, and posed his agricultural labors by the publication of a work entitled 'Markham's Farewell to husbandry,' in which the following passages occur. 'If you be near unto any part of the a-coast, thence fetch great store of the salt, and with it cover your ground which hath bene formerly ploughed and hackt, allowing to every acre of ground three score or four ore full bushels of sand, which is a very good and competent proportion; and this sand thus d shall be very well spread and mixed amonge other broken earth. And herein is to be used that not any other sand but the salt is good or available for this purpose, because it is brine and saltnesse of the same which breedeth this fertility and fruitfulness in the earth, making the growth of all weeds, and giving strength, vigor and comfort to all kinds of grain, pulse, or fruit of a better nature.

Now methinks I hear it objected, what if ground do lye so farre within the land that there is no salt sand within many score miles of you then shall I make good my barren earth? This I answer, that albeit this salt sea-sand of infinite good and necessary use, enriching lands wonderfully much; but if your ground be much within land, and farre from the sea, to every acre of land you shall take two bushels of very dry bay salt, and in such manner you sow your wheat you shall sow this upon the ground; then immediately after sowing the salt you shall sow your wheat, which should be thus prepared before you sow. The day before you sow your grain, you take bay salt and water, and mixing them together, make a brine so strong that it will bear eggs; then put the wheat you are to sow in that brine, and let it steep therein till the next day; then drain it from the brine and so sow it; and no doubt but you shall find a marvellous great increase thereby. Neither is the grain itself without good and strong probability of increase, and strength for the bettering of all other arable grounds; for there is nothing which killeth weeds, quicks and other offences of ground, so much as saltnesse."

Mr. Coxe, in his memoir, printed in the Philosophical Transactions, on manuring the land with sea-sand, writes thus—"The effect it produces, where much of this sand is used, is that the seed is much and the straw little. I have seen good barley, where the ear has been full in length with the straw it grew on. After the grain is cut, the grass though it be but little, yet as to feeding, giving good creams, and plenty of milk, and all other good purposes, far

exceeding the longer grass, where less sand is used.—Phil. Trans. abridged, vol ii. p. 730.

In the year 1817, examinations relative to the uses of salt in agriculture were instituted before the Board of Trade, in great Britain. They were commenced in April and continued, at short intervals for many days. The written evidence that was delivered on that occasion was printed by order of the House of Commons, and the following extracts compose a part of the testimony.

Evidence of the Right Honorable Lord Kenyon.

"By the information which I have been able to collect, I am induced to consider salt, when sparingly applied, as an admirable manure, especially for fallows and arable land; and when mixed up with soil out of the gutters, or refuse dirt, or ashes, to be very valuable also on grass-land. My own experience convinces me that it is very powerful in destroying vegetation if laid on too thick, having put a large quantity of refuse salt on about one-fourth of an acre of land, which after two years, remains quite bare. A land surveyor of high character in my neighborhood considers that the use of salt would be likely to be very valuable in destroying the slug, wire-worm, snail, &c. which often destroy whole crops. He also well remembers that salt was used largely in the neighborhood of the higher and lower Wiches in Cheshire, before duties were raised to their present height."

The Evidence of Mr. Kingston.

"In reply to your queries, as an agriculturist, I have no hesitation in saying that salt, if free from duty, would become one of the most useful and general articles of manure that ever was thought of, if properly prepared by mixing it with mud of any kind, the cleaning of ditches and ponds, the surface of coarse grounds, thrown into heaps to rot, blubber, &c. &c. I am likewise persuaded that if it could be afforded to be sprinkled on the layers of hay when making into the rick in catching weather, it would prevent its heating or getting mouldy.

"I had some small oxen tied up to fatten, which did not thrive, owing, as the bailiff said, to the badness of the hay, of which they wasted more than they ate, but by sprinkling it with water in which some salt had been dissolved, they returned to eat it greedily. From this and many circumstances of a similar nature, I am free to say that if the food of cattle tied up to fatten was sprinkled with a proper quantity of salt, they would thrive much faster than by the present mode, and would prevent their being bled by an excess of food."

We might add to the foregoing a mass of facts and opinions, given at various times, before Committees of the English House of Commons, all concurring in favour of salt, both as a manure, and a condiment to season the food of cattle. But that part of the testimony which adverts to salt as a manure, in general, merely corroborates what we have already stated, and that which relates to utility of salt in feeding cattle, preserving them from disease, &c. may be adverted to hereafter.

Dr. Mease of Philadelphia, in a note append-

ed to the Philadelphia edition of a pamphlet entitled, "A Letter to the Farmers and Graziers of Great Britain, to explain the virtue of Salt," &c. says,

"The article of salt for various agricultural purposes, has long been known and attended to in the United States. As a manure it was early used for flax, as appears from some of Elliott's essays on husbandry, printed in Boston, between 1745, and 1754; and Mr. Cadwalader Ford, in a paper on the subject, addressed to the Massachusetts Agricultural Society, and published by that body, bears testimony of its highly fertilizing effects on flax. The proportion which he advises to be used is double the quantity of salt to that of seed. He strewed the salt at the time of sowing the seed. From three acres of flax sowed he had 50 bushels of seed, and also an excellent crop of flax.

"The publication of Mr. Ford's paper by Mr. Carey, caused the experiment to be repeated by Mr. Henry Hendrickson, of Cecil County, Maryland. He states that on a poor piece of land he sowed one peck of flax-seed, and one peck of salt together, and that when the flax was about three inches high, he sowed another peck of salt on it: He also sowed a piece of excellent land with flax, and although he had a good crop, yet the flax on the poor land "was a great deal better, and produced more seed than the flax on the rich land." A farmer in Delaware County to whom I mentioned the fact of the utility of salt as a manure to flax, told me he had tried it, and that it was plainly seen to be of great benefit."

"The farmers on the brackish rivers on our coast, find that the salt grass growing on the water's edge, when ploughed in, acts as a very excellent manure for Indian corn; and on the Rariton particularly, it is a general practice thus to employ it."

It would be easy to swell this article by giving the names, and the substance of the testimony of many others, who are renowned for their science and skill in agriculture. But enough has been exhibited to prove that common salt may be useful, or it may be injurious as a manure. Injudiciously applied, or applied in too large quantities its immediate effect is to destroy vegetation, and cause the land for a season to be altogether unproductive. Like quick lime when applied to growing crops, it is often corrosive. Mr. Beck, an English gardener, destroyed his onions by the application of salt to the soil after the young plants have made their appearance. Asparagus, we are informed receives great advantage from salt as a manure, which might be inferred from its growing naturally on the borders of salt marshes. Probably Sea Kale (Crambe Maritima) a plant, which, in a state of nature, we are told is nowhere found, excepting on the sea coast might receive as much benefit from salt as a manure as asparagus.

If a soil is totally deficient in animal or vegetable matter, and has nothing which on burning, or roasting it, after being carefully dried, can be expelled by heat, we believe that salt would not answer any valuable purpose if applied as a manure. Mr. Samuel Parkes, an English scientific

writer of eminence, and author, we believe, of a work of much merit entitled "Parkes' Chemical Catechism," says, "I am desirous of remarking that no land can be said to be fruitful which is entirely exhausted of carbonaceous [coaly] matter; therefore if it were possible for an estate to be so worn out by successive crops that little or no carbon remained in the soil, it is not likely that salt alone would restore it to its original fertility. I consider also that the land which contains most carbon* will derive most benefit from the application of salt. But the safest way for a farmer to proceed is to use his salt sparingly at first, and in all cases to leave a portion of the same land without salt, so that the real effects produced by the salt may be, by comparison, in every instance self-evident and palpable."

* All animal and vegetable manure consists principally of carbon, or coaly matter. (To be continued.)

REMEDY FOR HYDROPHOBIA.

The following interesting notice of the discovery of means to prevent that dreadful disease so frequently consequent upon the bite of a mad dog, is a translation from a German paper of the 2d of November last:—

"All caustic alkalis have, in consequence of the numerous and repeated experiments of Messrs. Von Redi, Fontani, Mederer Von Wuthwehr, and others, been found to possess the property of rendering altogether harmless the poison of the bite of a mad dog. The wound must be well washed, as soon as it can be procured, with *ley*, which, however, must not be stronger than can be borne in the mouth. If it be stronger than this, it has the effect of drawing the edges of the wound together, and preventing the *ley* from being applied to the bottom of the wound, where it might meet with and neutralize the poison."

"It is astonishing," adds the abovementioned paper, "that this, so simple a remedy, should not have been before discovered; and were it published in all the schools and academies of medicine, it would have the effect of saving many valuable lives."—*N. Y. Gazette.*

Sore Throat, from cold.—At this season of the year, when common colds are prevalent, a better remedy cannot be prescribed for a *soreness* or *inflammation of the inside of the throat*, which often attends a severe *catharrh*, than the following:

Mix a wine-glass full of good calcined Magnesia and Honey, to the consistence of paste, or jelly, and take a spoonful once an hour through the day, for a day or two. It is *cooling, healing*, and a very gentle *cathartic*.—*Bermuda paper.*

From the American Farmer.

CATTLE.

VARIOUS BREEDS—LARGE OXEN.

[Of neat cattle, there are various races, some best adapted to the yoke—some to a milk dairy—some to a butter dairy—some to the butcher's shambles, and some so ill formed, unthrifty and unprofitable, as to be fit only for hounds and buzzards.]

It becomes all farmers, let their number be few or many, to keep such as are best adapted to their particular purposes; and this can only be done by making themselves acquainted with the peculiar properties and propensities of each race.

It is in England, that the most persevering and best directed efforts have been made, to perfect the various breeds, with a view to different purposes; and such has been their success, that it is now understood, that by successive and judicious selections and crossings, a breed of cattle, sheep, or hogs, may in a somewhat longer process of time, be made up, possessing any given color, shape or quality, with almost as much certainty and precision, as the manufacturer can give to the productions of the loom, such stripes and texture as his fancy may suggest.

We shall endeavor to give our readers such information, as will enable them to understand the characteristic points of the breeds now most esteemed in that country, beginning with the "Improved short horns," which appear to be more in demand, and to sell for higher prices, than any other family of cattle at this time.—They were formerly found in greatest numbers and perfection in the county of Durham, on both sides of the river Tees, and hence the appellation of the Tees water breed. But this breed has of late years been greatly improved upon, and of this stock, so meliorated "THE IMPROVED SHORT HORNS," is now the established and appropriate designation.

It is already known to the readers of the American Farmer, that we have this breed of cattle, in their greatest purity and perfection.—In Massachusetts, on the estates of Samuel Jacques, Esq. of Charlestown, owner of Caeles, and Stephen Williams, Esq. of Northborough, owner of Denton—also a bull presented to the Massachusetts Agricultural Society, by Admiral Coffin of the British Navy, a native of Massachusetts. In Pennsylvania, the only full blood stock of this breed, male and female, that we know of, are in the hands of Col. J. H. Powell, and in Maryland at Wye farm, the elegant estate of Col. Lloyd, of the Senate of the U. S. may be seen the bull Champion, and heifers White Rose, and Shepherdess, imported in the spring of 1822, by the Editor of this paper, from Charles Champion, Esq. from whom Gen. Van Rensselaer, has ordered a bull and two heifers, to enrich and ornament his vast estates in the state of New York.

The following is the pedigree of Col. Lloyd's bull Champion, as given in his letter to J. S. Skinner, dated 6th of April, 1822.

"I had named him *Blyth Union*, in consequence of being bred both from Colling's and Coats' best blood, but I request you will give him any name you think most suitable; if you think he deserves it, I shall be proud for him to be named the *Champion*; he was got by Warrior, for whose dam I paid Mr. Robert Colling 200 guineas, his dam was by Blyth Comet, whose dam I bought at Mr. Charles Colling's sale, for 170 guineas. Blyth Comet was also the sire of the ox in my group of animals which you have, and he was bred in and in from Comet, who was sold for 1000 guineas, at Charles Colling's sale in 1810;—his gran-dam was by Mr. George Coats' Palm Flower, who is own brother to my cow Crimson, for which I gave Mr. Coats 100 guineas when 13 years old, and Crimson is the dam of my bull Blaze, by Blyth Comet, which I am now using, and I hope your two heifers are in calf to him, as he is considered the most complete animal I ever bred for symmetry and quality.—His great gran-dam by Patriot, the bull you named in one of your letters, and which

Mr. Coats sold for 500 guineas, so that your bull partakes of Colling's and Coats' best blood.

This calf by Blaze, out of White Rose, calving in November 1822, took the premium at the last Agricultural Exhibition in Maryland, and the name "Pilgrim," was sold to Col. Powell, near Philadelphia, and now bears at Powelton, near Philadelphia, the name "Wye Comet," of its origin and history of these cattle, we find the following in the "SURVEY OF DURHAM."]

Edit. Am. Farmer.

THE TEES WATER BREED.

An attempt to improve them, (which I suspect was more with regard to size, than to other quality,) was made by Mr. Michael Dring, of the Isle, near Sedgfield, who brought a bull out of Holland, that is said to have improved the breed. A few years after, so other adventurers went over to Holland, and great bulk, was then considered as the criterion of perfection, they brought home a comely animal, with immense buttocks, which did a great deal of mischief; but there were some intelligent breeders that steered clear of this evil; and from them the pure Tees water breed has descended to the present time in which were united the properties of being fat to great weights, and being great milkers.

The visitants of Mr. Blakewell having seen what he had done with the long horns, by selection; and at how much earlier ages they got fattened, were induced to try what could be done by similar means; with the short horn and several selections were made for this purpose with great success.

The first particular recorded instance of Tees water breed, for fat and great weight was an ox of Mr. Hill's, of Blackwell, who was killed at Darlington the 17th December 1779, at seven years old; the particulars his weight are as follow:

Two fore quarters.	148
Two hind ditto	106
Carcass	212
Tallow	15
Total	232

The next was a five years old ox, of Milbank, of Barningham, killed at Barnardes in April, 1789: he weighed—

Two fore quarters	1044
Two hind ditto	1060
Carcass	2104
Tallow	224
Total	2328

This ox being at five years old only 19½ less than Mr. Hill's ox in weight of carcass and having five stones more tallow, was certainly

* Of these, Mr. Milbank, of Barningham, and Croft, of Barford, were the most eminent; and were considered as having the best and purest breed of district at that period, (about 70 years since); the colors of their cattle were red and white; and with a little red about the neck or roan.

This information was communicated by Mr. Thomas Corner, now near 90 years of age; and Mr. Geo. Culley says, that he has repeatedly heard his father state the same particulars.

The colors of the above being similar to those of present improved breed of short horns, makes it probable that they are descendants of the same race.

of a superior breed for fating at an early age; and most probably was descended from the one mentioned by Mr. Corner.

At that period it was thought that no ox could be made properly fat under five years old; I remember going in the year 1786, to see as a curiosity, a steer 3 and a half years old. Mr. Robinson's of Hutton, that was supposed to weigh 1120 lbs. and had been sold for £20* to select a variety to fatten at much earlier than had ever yet been obtained, was left the breeders of the present day to accomplish, who had the judgment to select, what accident threw in their way.

In the spring of the year, Mr. Bassett, of Dartington purchased a cow, with a bull calf at her foot, and putting her into a good pasture, she grew so fat, it induced him to dispose of her to a farmer in the August following, and the calf sold to a farmer in the neighborhood. At 9 years old he was purchased by Mr. Robert Colling, and Mr. Waistell, of Ahihiill, who at that time did not keep a bull for any other purpose than serving their feeding cows; but Mr. Colling finding him to have a great propensity to get fat, sold him to his brother Charles Colling, who was then beginning to breed, and anxious of selecting those with the best dispositions to fatten; for the same reasons, and with the same view, he soon after purchased of Mr. Hard, of Ayreholm, a cow, and a heifer, daughter.

This bull and cow, selected with so much judgment, are the original stock from which the celebrated Durham ox, and the justly acknowledged superior breeds in the possession of Mr. Charles Colling, Mr. Robert Colling, and Mr. Stopher Mason, are descended.

These Collings have frequently sold cows and heifers for £100, and bull calves at £100. Charles Colling has refused £500 for a cow; and in 1807, Mr. Mason refused 700 guineas for a cow.

These gentlemen let bulls out by the year; prices from 50 to 100 guineas; and the public are so fully convinced of their merits, that the celebrated breeders, cannot supply the demand from the pure blood, which they are anxious of preserving, as the amateurs of the breed are the breeds of their race horses, and the takers of bulls are become so well acquainted with, that the prices they give, are proportion to the good qualities of the individuals and merits of their progenitors—more being paid to their pedigree than to any other; for this purpose they have books containing the full pedigree of their stock, similar to the stud book of race horses, by which a person wanting to purchase any of their bulls, or to hire bulls, may see how they are ended.

The surprisingly fat individuals of this various numerous instances might be produced; and select one most deserving of notice, and known in most parts of the kingdom by the name of

THE DURHAM OX;

owned by Mr. Charles Colling, of Ketton, in the year 1796: his form and nice handling, indicating every disposition to fatten at an early age, the expectations entertained of him by the

and one-fourth pence per pound, was a great improvement at that time.

best judges were not disappointed: at five years old he was not only covered thick with fat upon all the principal points, but his whole carcass in a manner loaded with it, and was then thought so wonderful an animal, and so far exceeding whatever had been seen before, that he was purchased to be exhibited as a show, by Mr. Bulmer, of Harmby, near Bedale, in February, 1801, for £140: at this time he was thought to weigh 2352 lbs. his live weight being 3021 lbs.: this did not arise from his superior size, as will be seen on comparison in the following table containing

THE DIMENSIONS OF GREAT WEIGHTED OXEN.																			
Names of Oxen.	Age.	Length from horns to rump.	Height at			Girths of			Breathths of			Weights of							
			Crops.	Loins.	Breast from ground.	Crops.	Belly.	Loins.	Hips.	Shoulder.	Carcass.	Tallow.	Hide.						
Blackwell	6	9	5½	6	0	5	8	2	1	10	6	9	2	10½	2124	154	126		
Hewick Red	7	9	4	6	0	5	10	1	11½	10	0	10	1	2	10	2	9		
Ditto Mottled	7	9	3	5	10	5	9½	1	7	9	3	10	9	10	2	11	2	7	
Barnham	5														2104	224	123		
Mr. Charge's	7	8	2	6	2			1	3	10	7	10	8	10	10	2	9	3	0½
Mr. Colling's	5	3	4	5	3	5	5	1	6	10	0	10	2	10	2	7	2	7	
Ditto	10																		3060

Mr. Bulmer got a proper carriage made to convey him in, and after travelling with him five weeks, sold him and the carriage at Rotham to Mr. John Day.

On the 4th of May, 1801, for	£ s. d.
On the 14th May, Mr. Day could have sold him for	250 0 0
On the 13th June, for	525 0 0
On the 3th July, for	1000 0 0
	2000 0 0

Mr. Day preferred keeping him, persuaded that his merits were such, as would ensure him a greater return: but these prices are strong proofs of his very superior excellence, to whatever had been seen in those districts before.

Mr. Day travelled with him nearly six years,

through the principal parts of England and Scotland, and arrived at Oxford, in February, 1807, where on the 19th, the ox by accident dislocated his hip bone, and continued in that state until the 15th April, when he was obliged to be killed; and notwithstanding he must have lost considerably in weight, during this eight weeks of illness, yet his carcass weighed

Four quarters	lbs.
Tallow	2322
Hide	166
	112*

This was his weight at 11 years old, under all the disadvantages of six years travelling in a jolting carriage, and eight weeks of painful illness; had he been kept quietly at Ketton, and properly fed until seven years old, there is little doubt he would have weighed more than he did at ten years old, at which age Mr. Day states his live weight to be nearly 34 cwt. or

From which if there be taken for offal	5780 lbs.
	700

Leaves the weight of the carcass 5080 lbs.

Mr. Charge's ox was of the same breed as the Durham ox, being descended from a bull of Mr. Charles Colling's: he had been unwell for some time before he was killed, which reduced his weight considerably, at least 112 or 110 pounds.

* From Mr. Day's pamphlet, giving an account of this ox, the places he was shown at, and distance travelled, during the time he was in his possession.

HINTS TO MECHANICS.

Avoid giving long credits even to your best customers. A man who can pay easily will not thank you for the delay; and a *slack doubtful* paymaster is not to valuable a customer to *dimin* sharply and seasonably. A fish may as well attempt to live without water, or a man without air, as a mechanic without punctuality and promptness in collecting and paying his debts. It is a mistaken and ruinous policy to attempt to keep on get business by delaying collections. When you lose a slack paymaster from your books, you only *lose* the chance of *losing* your money—and there is no man who pays more money to lawyers than he who is least prompt in collecting for himself.

Take care how you agree to pay money for your stock, your provisions, your rent, or your fuel, and take *dog skins* for your work. One hand must wash the other, as poor Richard says, or both will go to jail dirty. Every man's trade ought to bring him money enough to pay all money demands against him; and no man can stand it long, who does not get money enough from his business to pay the cash expenses of carrying it on.

Maple Beer.—To every four gallons of water (while boiling) add a quart of maple molasses. When the liquor is cooled to blood heat, put in as much yeast as is necessary to ferment it.—Malt or bran may be added to this beer when agreeable. If a table spoonful of the essence of spruce is added to the above quantities of water and molasses, it makes a most delicious and wholesome drink.

Chillblains.—A plaster of common turpentine applied to chillblains, or frosted heels, will it is said in a few days effect a cure.

Extracts from an Address to the Hampshire, Franklin and Hampden Agricultural Society, Northampton, Mass. October 23, 1823. By ISAAC C. BATES, Esq.

(Concluded from page 203.)

"The classification of men in society is not arbitrary, but grows out of the nature of things. You may as well, therefore, attempt to change the immutable principles upon which society is founded, as to change the organization of it in this particular. You cannot do the one, without the other. Each department of industry, whether intellectual or corporeal, is filled, because there is something in it to be done, by which subsistence, or distinction, or both may be gained. This diversity of occupation forms classes, all governed by the same motive, and posing, with what ability they have, to the same results. Were you to take the fabric of the social state to pieces, therefore, it would make itself up again in the same general form. As in every character, so in every class, there are blemishes and defects; but much of the unhappiness of men results from magnifying the one and the other. And it will usually be found, that he who is most in fault, is most censorious; and that the same spirit, which kindles at the renown or elevation of another, would plant itself upon the crown of the arch of both, either by mounting to its height, or by levelling it to its capacity. There are lawyers who are the ornaments of their profession; others who are the disgrace of it. There are men of power and authority, who are the benefactors of their country; others who are its scourge. There are men of fortune, whose riches give means to charity and influence to virtue, that are the golden spires that glitter upon the capital of society—objects upon which the sun loves to shine and from which to reflect his own beams of munificent glory. There are others, on whom Providence seems to have smiled and around whom to have scattered a profusion of temporal blessedness and all the radiance of temporal honors, who are nevertheless an iron-bound coast, from which a fellow creature, however he may have been shipwrecked in the storms of life, however much an object of pity and compassion and charity, had better keep off and trust himself to the mercy of the elements—a coast upon which there is no life boat, and along which the passing mariner, whatever tempests may beat upon him and with whatever blackness of darkness cover him, never ventures the signal of distress a second time. I might run through all the classes in the circle of society and apply the same general remarks to individuals of each. You meet with farmers and mechanics who are conspicuously worthy, who adorn the station they occupy and would have adorned any other. You meet with others, the circle of whose being is narrowed to self alone, and whose imagination, in its most playful and discursive flights never ventures beyond it.

"But as we are all embarked in the same vessel, the conclusion is, we have storms enough to encounter and calamities to endure in this voyage of life, without mingling bitterness in each others cups, or infusing poison into each others comforts. We mar the incomparable beauty of our inheritance, by petty disputes and rivalries among ourselves. Run over the map

of the world; you cannot select a spot more privileged than that which you occupy. We wish the patriots of South America, of Spain, of Greece, success; because we look forward to the time, when they may enjoy what you now possess without limitation and may possess without end. But, after they shall have gone through the struggle of right against wrong, of the people against power, they will hardly have improved their condition, until, by education and moral culture, they shall have formed the mass of population into a race of men, capable of understanding their rights, as well as able to assert them. True, the convulsions of the revolution break up the old foundations of despotism; lay open the unexplored recesses and dormitories and cells of superstition; and send the light and air of truth and liberty through the dark domain of many centuries of mysterious and terrific power; and prepare the way, by thus rolling their scourge fiercely over the earth, for another and a better state of things; yet the time is far distant, when your sun will shine in their firmament; when the dews of your parochial, religious and civil institutions, will descend upon their mountains, and awaken into life, the countless blessings and beauties of your free and happy land. Here, you have perfect security for life, liberty and property. Here, you have equal rights and equal honors. He who will, may run the race and take the garland, or scale the heights and deck himself with the plumes of glory. I would inspire you, therefore, with the deepest emotions of filial and grateful affection for your pilgrim fathers;—these are the fruits of their toil; this is the land of their sepulture; here all your hopes are anchored;—and I would elevate you in adoration to Him who has manifested HIMSELF more distinctively, theirs and yours, than to any other people on the earth. O! it is a subject upon which I would dwell, and grow immortal as the theme. But I am admonished that I have passed the limits of the hour assigned me. There is a time,—when friends must part."

Extracts from "An Address of THEOPHILUS SCOTWICK, Esq. delivered before the Berkshire Association for the promotion of Agriculture and Manufactures, at Pittsfield, Oct. 2, 1823."

"Perhaps it is one of the greatest blessings of our society, that our habits and institutions are such, as that these meetings are of a character to draw together, by the pleasure they excite all classes of our citizens. The country can give no better evidence of its intelligence, of its devotion to those great interests, which constitute the happiness of man, than the single circumstance, of the multiplication of these societies, and the zeal with which they are supported. They show, that the laboring man, has here a rank, an importance, which he has never gained, in other countries, or other periods. The mass of mankind must labor, and the true business of governments is, to make this laboring class, respectable by their intelligence and virtue. If ignorant, vulgar, debased, they will be made use of, for the pernicious purposes, of the self aggrandizement of those few, who by their education, have superior cunning and ability.—These general truths are admitted by most of us, but the practical application of them to our country, is that which is now exciting the greatest attention among all men, who

are inquiring for those means, by which we are to assume, a still higher rank in the scale of nations. Of one thing we may rest assured: that this will never be accomplished by a miserable jealousy of one another, by contempt of the part of the rich towards the poor, or envy by the poor, of the rich. These miserable passions should find no place, among a people like ours. They are not of a natural growth here; they do not belong to our free and equal condition, for among us in the general, no man is rich but by his superior industry and talent. His industry is the best possession for the public, and his talent, whether the endowment of nature or the acquisition of superior skill, gives him a fair claim to private and public regard. These observations are made with express reference to your society, and the duties which are required of you. However much to be deplored it cannot be disguised, that there is a lurking jealousy and ill will towards these societies, and in some states, the opposition has become open and proceeded so far, as to endeavor, to deprive them of the government patronage, which they have heretofore enjoyed. A society like this, will in its origin, find its warmest friends among the more opulent farmers, among those, who having the most capital and enterprise are soonest excited by the competition, which it produces, and most capable of entering into it. Many who have less capital, do not consider the society as in any manner beneficial to them, so long as they cannot contend for its prizes. But nothing can be more false. The improver introduced by the dissemination of agricultural knowledge, are almost as free as the air. In this way, the poor man is enriched by his rich neighbor, without lifting his hand. He has only to open his eyes and his ears, to gain something from the general improvement.

"If it be a fine animal, its stock is easily propagated, if a fine seed, it will grow on one side of a fence as well as another, if a fine fruit, it sun is as bright, in a poor man's orchard, as his richer neighbor's. If the improvement is in superior skill, economy, industry, the sign of the example is open to every body, and the advantage becomes common. Indeed, he lies the foundation of the general progress of the country, not of this or that class, not of select few, but of all those, who have the spirit and intelligence to make any observation, on things around them. The rich man's possessions, are the poor man's blessing, if he will so consider it."

* * * * *

"One of the most obvious tendencies of the societies is, to raise the standard of refinement in all our ideas of improvement. This should be rightly understood, for when we talk of refinement, many are ready to say, that is not for us, that is only for the rich, for those who are born with silver spoons in their mouths. No so. The refinement we mean, is that which every being among us, should aspire to. It is money in a man's pocket, it is pleasure to the eye, comfort to his family, his beasts, and about him. It is found in cleanliness, which the mother of industry. Whitfield said, that I did not see, how a man could go to heaven with dirty hands. It is certain, that a dirty fellow far enough from heaven in this world, for nine times in ten, he is a miserable, shuffling, vulgar, ignorant, imbecile, who does not know

how to drive a nail. Providence has so ordered it, that the material of happiness, should be within the comprehension and power of all mankind. Your *clean* people are your prosperous people. Look at the Quakers, the Shakers, the Moravians, they are an example to us all. It will do no harm to this society, or our county, or any individual in it, to study these people and their institutions, that we may look to the foundation of their extraordinary prosperity. Things in their places, a pin for every hat, is their motto. Thank God, the period of liberal knowledge has arrived, and we are more disposed to imitate, than to hang, and burn them. The thing to be inculcated in all agricultural improvements is, that whatever be done, be done well, and for this purpose, perfect neatness and cleanliness is indispensable. Wherever these principles prevail in our persons, houses, gardens, fields, yards, stables, there you will add industry, and no waste. If you see a man about whom these appearances exist, rely upon it, he is going ahead, his acres are increasing, his cattle thriving, his children are kept out of the dirt, and preparing for some future usefulness. At the same time, he is gathering about him, the comforts, the refinements, the elegances of life, such as are suitable to his condition, a coach to roll in, not plate to eat from, or a carpet of course for his floor. These are only for the rich. But his house will be neat and in order and well covered, his fences in repair, his fruit trees will grow, while he sleeps, and he will have some beautiful shades, to cover him from the scorching sun, that prevails in our hot summers.—In all our efforts, we should inculcate upon our people the duty of not contenting themselves with the mere necessities of life. God has given something more, and it is our enjoyment.—The savage desires only, that will keep soul and body together. What is he, but a miserable wretch; cruel, selfish, a drunkard, his hair matted with filth, his body covered with vermin, equally frightful to the eye, and terrible to the mind of a cultivated man; and how much better are the common people in many christian countries, bearded with dirt, surrounded by smoke, living on potatoes, or the garbage that comes from men's kitchens? And what is the fate of these miserable men? They are loaded with taxes, they perish with hunger; their poverty renders them vicious, and their vices compounding their misery. No, fellow-citizens, if we desire to satisfy mankind that you have made discoveries in morals, as well as in the arts, if you will have a fine country, fine men, women and children, you must have fine cattle and horses and sheep, you must cultivate fruits, and beautiful shades, and these must be common. Yes, common, no man should live long us, who is not educated, so as to desire these refinements. To every reasonable extent, all this is within the power of the great majority of our population."

* * * * *

What a miserable creature is a man, without knowledge? Those who are agricultural must know, how best to cultivate corn, wheat, potatoes, onions, parsnips, carrots; they must know that the root of the cabbage may be six feet from the stalk, for then they will know where the spade and the plough are wanted. They must read the English Farmer's Ca-

lender, the New England Farmer, and the Massachusetts Agricultural Repository, or other such useful books, they must then put this and that together, and with the aid of their own observation, endeavor to find out the way, to make their lands crumble before the plough, or in agricultural phrase putrid with fitness. For this purpose, they must have the books, or some of the best of them; there is no better investment of money. Knowledge is a capital, that does not waste, neither moth nor rust corrupts it; it brightens in the using. A man who cannot read, is a poor creature; he has neither hands, nor eyes, nor ears, that are of any use; and a man, who can and does not, has but half the use of them. The knowing men are the prosperous men in every community, and that should decide the question with the people, as to the expediency, of pushing knowledge to every possible extent. But knowledge has its price, and must be paid for. If we are to be a great nation, renowned for order, frugality and industry, so that strangers shall inquire, whence comes the extraordinary prosperity of these people, what institutions have they not heretofore known to mankind, whence these discoveries for human happiness, and what are they, we must now in our youth, establish those principles and practices, which are to lead to these results. For this purpose, we must cultivate such a taste among our people, that they shall prefer an agricultural show, to a show of wild beasts; and when they come to these assemblies, it shall be, to take pride and pleasure in the patriotic men who stand foremost in the exhibition of fine sheep and horses and cattle, and to carry home some useful knowledge for their own towns and villages. For this purpose, we must so educate our people, as that every man shall have a just sense of his own value and importance as a citizen, with a good coat for a holiday and a Sunday, so that he shall consider it a dishonor to be ignorant, a disgrace to be a pauper, but by the indication of Providence, and an indelible infamy to be a common drunkard."

* * * * *

"Let us not deceive ourselves by supposing that our systems of education are perfect, while so much yet remains, that is quite practicable. The education that the great mass want, is a knowledge of the arts of life, and I should think, that any man who should prepare a plain and practical treatise upon agriculture, and the arts immediately connected with it, for the use of common Schools, would render an invaluable service to the public. Who knows any thing of schools, that does not know, that the time of an intelligent boy, is in a great measure wasted, who spends it upon his arithmetic, his writing copies, his spelling book, his reader's assistant, and his Dwight's geography (for this is about all) for the long period, from three and four years of age, to twelve and fourteen, when he leaves the school. Why should not an agricultural school book be written, as well as books in many other branches of knowledge? all that we can communicate by teaching in any science, is that which is now known, and as much is now rendered certain, in that department of knowledge, as in many others. No, fellow citizens, we must raise the standard of knowledge and taste, and not remain ignorant, that our agriculture is in almost an infant state compared with that of many other nations; we deceive our-

selves by supposing, that their superiority consists wholly in capital, and the cheapness of labor.—Not so.—It really does not require capital to put to the plough, half the lands, that are now in tillage.—nor to know, that between one plough and another, there is a difference of between two and six hundred per cent, as to economy of labor.—Nor for the purpose of adopting, substantially, the admirable contrivances, English and Flemish, for the saving of manure, a saving which would pay all our taxes, state, county, and town.—Nor to know, that lands in tillage should be reduced by the plough and the harrow like our gardens by the spade, to a powder, so that many a fine little creeping fibre of the plant, may travel on in company upon the same soft easy road, and when they are tired of the journey, may rest together upon a good bed.—It does not require capital to plough a field four and five times instead of twice, till there is not a cold, matted, impervious clod left.—It is the *work*, the *work*, that is wanted, and not the *afternoon* farmer.—It is not capital that in twenty years, has doubled the value of the produce of the fields of this county, which I know to be the opinion of many an intelligent farmer.—Nor is it capital, but knowledge, that is necessary, for any man to find out the best possible way of doing in the best and cheapest manner, the thing to be done.—It is not your ignorant people that perform any thing, even the most common operation of farming, in the best manner.—Their way has always the least contrivance and management in it, takes the longest time, is the coarsest, most slovenly, and wasteful."

* * * * *

"We talk of the want of capital, and turn with disgust or incredulity, from the accounts of English farming, as though because they live on an island, are surrounded with damps, have landlords and tenants and not our fine Sun, cultivate turnips and cabbages, that therefore, we have nothing to do with their agricultural arts. But do they not as we, live upon veal and mutton, beef and pork? Have they not meadow lands and grass lands? Do they not with us, cultivate beans, peas, oats, rye and wheat, and if so are not their arts worth knowing by us? And does this require capital? It would be to sure, require some money to build a pit for the saving of manure, with brick work in terras mortar, after the manner in Flanders, but it would not take the odds and ends of more than a dozen days, for any common farmer to dig a pit in his yard, to be well clayed at the bottom, and covered at top, so as to be a receptacle, with the aid of proper conductors from his stables, for all that passes from his animals. The making of manure by raking and scraping, and every possible contrivance should be the first law to the farmer. We justify ourselves in our slovenliness and low ideas, by complaining of a want of capital.—No, let us not mince the matter, one to another, it is knowledge, pride and neatness, that we want. It really does not require a capital in money to raise a fine cow or horse, always sleek, fat, clean, that shall pass its days rejoicing in life, with gratitude to its master (for we may desire to believe that the poor brute has some such thoughts) no, the half that is wasted, will do that, and then the animal is of double the value. But it does require a stock of shiftlessness, laziness, and hard-heartedness, to bring up a herd

of miserable, wretched, half starved, dirty, downcast, mourning cattle, that seem to deplore their very existence, and are at all times more fit as food for the wild birds and beasts, than for the use of man. The subject of fruit, is of great importance to a district of country like this, where some of the finest, as the apple, plum, pear and cherry, will flourish as well as in any other. What is fruit, but one of the first and best gifts of God to man, and where is there a finer sun for ripening some of the most delicious, than we have for three months in the year? This is a real luxury and refinement, to which every man, who has an acre of land should accustom himself. What cheaper luxury with which to load the hospitable table? Men will have luxuries, and if so, they must pay for them. We go to the Indies, to get the materials of a pudding, when our gardens and fields might furnish us with a much richer and healthier repast. It is the *economy* of fine fruit, that we want.—Set a child down to a dish of fine peaches and cream (for the peach may be produced in perfection among us, though it will not live forever, and what tree will?) or of fine gages, or if you please the horse plum, as we call it, and he will soon show you what is good, for he *knows*—he will pass by the pudding. Then there is another advantage of the fine fruits, of all the productions of nature, they are the healthiest—If they were common, dysenteries and colics would be less so, and we should be saved from many a doctor's bill, which no body can read or spell, but which every body must pay. In health lies much of the glory and happiness of a man, and can it be supposed, that the Supreme Being does not require from his creatures, the greatest possible attention to it, when it gives him a glistening eye, a strong arm, and a body fit for labor. There is another advantage still, in cultivating the fine fruits. It teaches a man something; It teaches him to perform a nice operation, and to do it well. It teaches him a lesson of eternal vigilance and industry, and to be up and stirring, when he would otherwise be yawning and sleeping. Then again, if he will know how to inoculate and engraft, and generally the nature of all the fruits, he must *read*. It is reading and education in those matters that appertain to the arts of life, that our laboring people want. I mean if they will know how to perform these operations, in the best manner. They must read what Mr. Knight has written, or Forsyth, or the American Orchardist, or Colbetti, or something or another, and not pursue the trade of engraving, as I have known it done in this county. That is, cutting off the whole head of a tree, and filling it with grafts, which exposes it to almost certain death—placing winter fruit upon summer, or the reverse, without a single enquiry, as to the nature of the stock; putting twenty grafts upon one tree, beginning at the bottom and going up with a tier, one upon another, thinking I suppose, that a tree like a horse may carry double. Rely upon it, that if you teach a boy to labor and to read, though it would be contemptible to suppose, that *reading* will enable him to plough *as by a line*; if the operations have been going on together, if he be not a miserable imbecile, he is the more of a man for it, and in the end, will show you better cows and horses, potatoes, carrots, and wheat, and *more of them*. No, we want the fruits; in our orchards the

Pippin, the Spitzenburgh, the Rhode-Island Greening, the Swaar, and other fine apples, and not so much of the miserable trash which the pigs will turn from. In our gardens, fine cherries, peaches, pears, and plums. For all this, we must have the nurseries, and not be compelled to send to Mr. Prince on Long-Island, or to Lansingburgh, or to Athens, for our trees, *for we can't afford that*. These would make a fine addition to the agriculture of our county, not much less celebrated, if I am not mistaken, than any other district of country, (unless in the immediate vicinity of the great towns) in any state whatever.

(TO BE CONTINUED.)

NEW ENGLAND FARMER.

SATURDAY, JANUARY 31, 1824.

IMPROVED BREEDS OF CATTLE. The article on this subject which we have republished in this day's paper, from the American Farmer highly merits the attention of every agriculturist, who wishes to *keep pace* with the improvements of the day. It is quite as easy, and much more economical, if we can but "*get in the way of it*" to raise animals of the first rate and first quality, as the lank, raw-boned, slab-sided "creatures" which disgrace the farm yards, and cumber the premises of some farmers, whose cattle are caricatures of their species, and as unprofitable as they are ugly.—The value of the "*Improved Short Horns*" or "*Durham Breed*" is however well appreciated in this vicinity. *Denton*, owned by Stephen Williams, Esq. and *Caleb*, by Col. Jacques, and the "*Admiral*," by the Massachusetts Agricultural Society are in high repute and great demand. *Caleb*, we are informed, has earned for his owner the past season the good round sum of *six hundred and twenty dollars*.

TO CORRESPONDENTS. The request of "*A FARMER*" in Vermont, to insert in our paper "the practice of some gentlemen in Massachusetts with regard to grafting fruit trees," shall be complied with to the extent of the information we can procure.

With respect to the method of "cultivating Teasels," our correspondent may find an article on that subject in the first volume of the N. E. Farmer, page 272. The following from Mr. Wells & Lilly's edition of *Deane's New England Farmer*, may, perhaps, be of use.

"Mr. Miller says "This plant is propagated by sowing the seeds in March, upon a soil that has been well prepared." Any time in April will answer in this country. "About one peck of seed will sow an acre; for the plants should have room to grow, otherwise the heads will not be so large, nor in so great quantity. When the plants are come up, they must be hoed in the same manner as is practiced for turnips, cutting out all the weeds, and singling out the plants to about eight inches distance. And as the plants advance and the weeds begin to grow again, they must be hoed a second time, cutting out the plants to a wider distance; for they should be left, at least a foot asunder, and should be kept clear from weeds, especially the first summer: for when the plants have spread so as to cover the ground, the weeds will not so readily grow between. The second year after sowing the plants will shoot up heads, which will be fit to cut about the beginning of August; at which time they should be cut and tied up in bunches, setting them in the sun, if the weather be fair; but if not they must be set in rooms to dry them. The common produce is about a hundred and sixty bundles or staves, upon one acre, which they sell for one shilling a stave."

The gentleman who favors us with remarks on Horticulture and other subjects relating to Rural Economy is solicited to continue his favors. His communications appear to have met the approbation of the public, and have been republished in the "*American Farmer*," and several New England papers. His observations on "*Green Corn*" are in type and were intended for this No. of our paper, but are unavoidably postponed.

CONSTRUCTION OF BARNS. It has been intimated that some of our subscribers would be much obliged if we would furnish some model or description of the best mode of constructing BARNS. We have heretofore discussed this subject, and devoted several papers to remarks on the most eligible situation and construction of Barns, and other Farm Buildings. See N. E. Farmer, vol. i. page 353, 361, 369. See, likewise the Remarks of Col. John Hare Powell, N. E. Farmer vol. ii. p. 141. We should be happy, however, to receive communications on this subject, and should any thing further occur to us, which promises to be useful we will publish it.

FOREIGN.

The last advices from Europe were received by the way of Charleston from Liverpool, and include London dates to the 5th Dec. They contain however, nothing of much importance. The French troops are leaving Spain, and their principal commanders have already returned to France. The troops remaining are commanded by Count Bourmont.

Gen. Mina has left Spain and arrived at Plymouth where the populace took his horses from the carriage and drew him in triumph to the hotel.

From Havana.—The U. S. schooner, Wild Cat, Lt. Wolbert, arrived at New Orleans from Havana which place she left Dec. 14th, informs, that the Governor of Cuba had issued a Proclamation, announcing that it was the intention of the King of Spain to restore all the Colonies to the mother country as soon as possible.

Pirates Taken.—We learn from Capt. Labouisse, arrived from St. Domingo, that the government and merchants hired a small Haytian schooner and manned her with 40 men, with a supply of provisions, for a cruise in the Mona Passage, after a gang of pirates. The scho after an absence of 12 days, returned, having succeeded in capturing *twenty-two* pirates.—She also recaptured a considerable amount of property, consisting of coffee, indigo, and hides.—*National Advocate*.

Antique.—The Swedish Consul at Alexandria, Egypt, has obtained possession of a commercial note written on papyrus. 102 years before the birth of the Saviour.

DOMESTIC.

Maine Sufferers. The amount of the collections for money, clothing, &c. for those who suffered by fire in Maine is said to have been \$25,229 74 cents.

A Plattsburgh paper of Jan. 10, says, a large number of villains concerned in counterfeiting specie dollar have been arrested in Upper Canada. Among the culprits are a Methodist Minister, several physicians, apothecaries, blacksmiths, and a number of young lawyers.

At Savannah on the 12th and 15th inst. the thermometer in the shade, was at 75—the peach and plum trees were beginning to put forth their buds, and it was feared a succeeding frost would destroy the fruit for the ensuing year.

A hog, 21 months old, and weighing when dressed 647 lbs. was exhibited in Boston market a few days since. It was raised at the Cambridge Alms House.

The Concord, Mass. Gazette, of the 24th inst. states, that fourteen cases of the small pox had occurred in Lexington previously to last Saturday. "We are authorized by Dr. Hurd, who superintends the Lexington Hospital, to state that no new case has occurred since that date. Of persons now sick only three are considered dangerous; the others are either already recovered or have the symptoms of a mild, and favorable nature. There have been but three deaths. Some persons have already recovered and been dismissed from the hospital."

CONGRESSIONAL.

LY SENATE.—Friday, Jan. 16. A motion was laid on the table, to direct the Secretary of the Treasury to furnish the Senate with a list of all Purseurs and Navy Agents who are in arrears to the United States the amount of such arrears in each case, and the sums which are likely to be lost, ultimately, by the government.

Monday, Jan. 19. Mr. Holmes offered a resolution to the propriety of an inquiry on the subject of the Indians, the object of which is to include those in the State of Maine with those on the other settlements, as to instruction and civilization. Mr. Lowrie presented the Memorial of the merchants and underwriters of Philadelphia, on the subject of French spoliations.

The bill authorizing the purchase of 7 per cent stock was taken up, altered, read, engrossed and passed. On motion of Gen. Jackson, the bill for the relief of 4 officers and men engaged in the Seminole war was referred to a third reading.

The resolution which passed the House, authorizing a President to despatch a ship of the line to France bearing to America the Marquis De La Fayette was read and committed.

Mr. Lloyd, of Mass. submitted a resolution that the Secretary of the Navy be requested to communicate to the Senate, so far as can be ascertained, from the records in the Navy Department, the quantity of cordage manufactured from hemp of domestic growth, which has been used in the service of the navy since year 1812, and the reasons, if any, why cordage manufactured from domestic hemp cannot be used as advantageously as cordage from foreign hemp.

House.—Friday, Jan. 16. A statement was received from the Treasury Department, of the value of the hemp which the United States held with Greece, Asia Minor and Egypt, during the years 1820, 1821, 1822. A resolution was passed on motion of Mr. Hobart, for instructing the Committee on Ways and Means to inquire into the expediency of repealing so much of the act entitled "an act laying a duty on imported salt," as authorizes a bounty on pickled fish exported, of granting in lieu thereof an allowance on the cargo of vessels employed in the mackerel fisheries, the same way as to vessels employed in the bank, other cod fisheries.

The House refused to consider a motion, made by Kent, for calling up the resolution for appropriation of funds for education, in the old States, proportionate to that which has been allowed for the same object in new States.

A bill to authorize the purchase of the seven per cent stock, passed, and was sent back to the Senate.

Monday, Jan. 19. Numerous petitions, &c. were noted and referred.

A act concerning the invalid pensions was passed.

Mr. Todd gave notice, that on this day, two weeks, he would call for the consideration of the Tariff Bill. The House then resolved itself into a Committee on Webster's resolution to send a Commissioner to Mexico. Mr. Webster delivered a very eloquent and extended speech in its favor. After which, on motion of Poinsett, the Committee rose, and the House adjourned.

Tuesday, Jan. 20. Mr. Clay laid on the table a resolution in favor of the Independent Governments in America.

Poinsett introduced the following resolution in favor of the Greeks.

Resolved, That the House view with deep interest the struggle of the Greeks to elevate themselves to the rank of a free and independent nation, and unite the President in the sentiment he has expressed in favor, in sympathy for their sufferings, in interest for their welfare, and ardent wishes for their success.

Randolph spoke against a resolution favorable to the Greek cause. Mr. Clay delivered his sentiments in support of Mr. Randolph, and Mr. Dwight, of New York, in favor of Mr. Webster's resolution.

Tuesday, Jan. 21. The Cause of the Greeks is today the subject of discussion, and Mr. Cary, of Virginia, spoke in opposition to the resolution, but complimented Mr. Webster for the "splendor of his cause," and the "glories of his eloquence."

Wood, of N. Y. followed Mr. Cary on the same question, and Mr. Baylies advocated Mr. Webster's Resolution.

Thursday, Jan. 22. Was occupied by speeches on the Greek question, but no decision was obtained.

MASSACHUSETTS LEGISLATURE.

LY SENATE.—Wednesday, Jan. 24. A resolution has passed both branches of the Legislature, highly approving of the motion made in the Senate of the United States for opening a communication from Barnstable Bay to Buzzard's Bay, and for instructing the Senators and Representatives of this State in Congress, to use their endeavors to obtain a survey under the authority of the United States' Government of those Bays and the land between them, to ascertain the practicability of forming such a canal.

Thursday, Jan. 22. The subject of granting a Charter to Amherst Institution was discussed. Several gentlemen expressed their sentiments, and it being intimated that others were desirous of communicating their views, it was postponed.

Friday, Jan. 23. The petitioners for a charter to Amherst Institution had leave to bring in a bill.

A resolution offered by the Hon. Mr. Sprague for erasing from the Resolve of the Senate passed on the 15th of June 1813, in substance, that it was not becoming a moral and religious people to express any approbation of military or naval exploits which are not immediately connected with the defence of our sea coast and soil was passed. Year 22. Nays 15.

Saturday, Jan. 24. A resolve, fixing the number of Judges of the Supreme Judicial Court was reported, and the further consideration thereof postponed to Tuesday next. Other business was transacted of a private and local nature.

Monday, Jan. 26. The Committee on the claims of this State against the United States, for services during the war, was instructed to report forthwith.

House.—Tuesday, Jan. 20. The Report of the Committee on the Gaols in this Commonwealth, were committed to a Committee of one from each county.

Wednesday, Jan. 21. A bill relative to taxing the property of Manufacturing institutions passed to a third reading.

A Committee on the subject reported that it is not expedient to alter the usual time at which the valuation and taxes shall be made. Accepted.

Thursday, Jan. 22. No public business of consequence was transacted on this day.

Friday, Jan. 23. A bill for taxing sheep, was read, assigned for Tuesday next and committed to Messrs. Thayer, Hobart and Felton.

A Committee was appointed to consider the expediency of amending the laws relative to suppressing and punishing of common beggars and other idle, disorderly and lewd persons.

Finished Business.—Bills, in addition to an Act entitled an Act to incorporate the Boston Asylum for Indigent Boys; and to incorporate the Evangelical Tract Society passed to be enacted.

Report on the petition of Zephaniah S. Moore and others, in behalf of the Amherst Institution, granting leave for a bill, came down for concurrence, was read, and Tuesday next 11 o'clock, assigned for the consideration of the same.

Saturday, Jan. 24. A bill regulating the taxation of property belonging to the Manufacturing Corporations was read the third time, and the further consideration postponed to Tuesday next.

Monday, Jan. 26. Messrs. Sullivan, Willard and Merrill were appointed a committee, to consider whether any and what provision ought by law to be made to prevent fraudulent attachment of real or personal estate. Sent up for concurrence, and in Senate read and concurred and Messrs. Strong and Mills joined.

BRISTOL CROWN GLASS.
150 BOXES Bristol Crown Window Glass, of superior quality, just received and for sale, wholesale and retail, at the very lowest prices, by ERIGHAM & DELANO, No. 30, Union-Street.

FARMER WANTED.
WANTED a married man to carry on a Farm of about 40 acres, within about five miles of the city, and in an excellent neighborhood. This farm is of an easy cultivation, and will be principally appropriated to grass.—A person will receive good encouragement, and may make an arrangement for a number of years by applying to this Office.

NEW AND VALUABLE IMPROVEMENT.

JUST received, and for sale at the Agricultural Establishment, No. 20, Merchants' Row, Willis' highly approved patent Straw Cutter; for simplicity, ease, and despatch in cutting straw, hay, &c. far exceeding any now in use.—Likewise, Safford's improved Straw Cutter; with a variety of common Hand Machines, for the same purpose.—Also, W. James' improved patent Corn Sheller, a very valuable and simple Machine.

Jan. 31.

SUBSCRIBERS indebted for the first volume of the Farmer, are earnestly requested to make immediate payment at this office. The sum due from each is small, but the aggregate amounts to a large sum, and unless received soon, the subscriber will suffer very serious inconvenience in consequence.

Nov. 29, 1823.

SONG.

O! had I the wings of a swallow I'd fly,
Where the roses are blooming all the year long,
Where the landscape is always a feast to the eye,
And the bills of the warblers are ever in song;
O! then would I fly from the cold and the snow,
And hie to the land of the orange and vine,
And carrol the winter away in the glow
That rolls o'er the green bower of the line.

I'deud I should gloomily steal o'er the deep,
Like the storm-loving petrel, that skims there
alone;
I would take me a dear little martin to keep
A sociable flight to the tropical zone;
How cheerily, wing by wing, over the sea,
We would fly from the dark clouds of winter away,
And forever our song and our twitter should be—
"To the land where the year is eternally gay."

We would nestle awhile in the jessamine bowers,
And take up our lodge in the crown of the palm,
And live like the bee, on its fruits and its flowers,
That always are floating with honey and balm;
And there we would stay, till the winter is o'er,
And April is chequered with sunshine and rain—
O! then we would flit from that far distant shore,
Over island and wave to our country again.

MISCELLANY.

From the American Daily Advertiser.

CURIOUS FACT.

MR. POULSON.—The following fact, had it not come from the most undoubted authority, might be questioned even by the most credulous, but emanating from the most veracious source, its authenticity may be confided in:—A waggoner named Silas Thompson, while driving his team on the road west of Rochester, N. Y. observed from the precipice on his left a man suspending himself apparently by the hands, from a grape vine at the distance of twenty or twenty-five feet from the ground, who, on being taken down from his perilous situation, seemed entirely insensible and lifeless, but after assiduous attention, exhibited symptoms of returning life. Being sufficiently restored to converse, said his name was Thomas Wheaton, which was recognized by the bystanders, and that while cutting wood in the forest above, his foot slipped from the brink of the precipice, to the base of which he must irremediably have been thrown, had it not been for the occurrence of a grape vine, which he grasped, and which proved his preservation. He supposed he had been hanging three or four hours, when he lost by degrees all sense and animation, and in this state was found by the waggoner; and which proves how great are the exertions man will make for the preservation of his existence.

Yours, respectfully, G. S. A.
Philadelphia, Jan. 15, 1821.

From the Newburyport Herald.

VACCINATION.

In despotic governments the extent to which vaccination has been carried is astonishing. In Russia, no less than 1,200,000 received the benefit of it, between the years 1801 and 1812. In Denmark, the small pox no longer exists:

and in a circular addressed in July, 1816, to all magistrates and bishops in that country, it was ordered that all should be vaccinated, without a compliance with which injunction no individual could be received at confirmation, admitted into any school or public institution, or bound apprentice to any trade. Priests were also forbidden to marry those who had not either had the small pox or cow pox. In Prussia if any persons happened to die of small pox, they were directed by an edict, published in 1816, to be buried within twenty four hours, *silently and unattended*, without the tolling of a bell; and in such veneration is the great discoverer of vaccination held, that the 14th of May is made an annual festival to commemorate the day on which he made his first experiment. None but medical men regularly educated were allowed to vaccinate in the kingdom of Bavaria, and each was required to keep a register, which was returned to the government every three months. For this trouble they were rewarded according to the zeal they manifested in the cause. With the hope of wholly banishing the small pox, it was enacted, by Maximilian Joseph, King of Bavaria, that from July 1808, all persons above a certain age, who continued to neglect to be vaccinated, should be fined by an increasing penalty every year so long as they refused to take the means for their own protection. Variolous inoculation was forbidden, and a penalty enforced against all those who performed or submitted to it.—*N. Y. paper.*

[Translated for the Charleston Courier.]

From "L'Histoire des chiens Celebres."

THE COACHMAN'S DOG.

The Marquis de Segonsac, Attorney-General of the exchequer, at Paris had a very skillful Coachman, and without derogating from the good qualities of his trade, Mr. Saint Louis was very fond of the juice of the grape.—What rendered him more dangerous to his employers, and to the busy travellers in frequented streets, was, the art with which he concealed his intoxication. The more inebriated he was, the more bold he became—and rattled over the pavement to the great peril of the poor foot passengers to whom he could not give the alarm, because, when drunk, his teeth were so firmly closed that he could not articulate a word.

It happened, luckily, that this imprudent drinker always had with him at his feet on the box, a large Mastiff Dog, who was perfectly aware of his master's situation. So, when he perceived that his master was not capable of avoiding danger, this sagacious animal took upon himself to put the passengers upon their guard—and as soon as he saw a loaded porter, or an infant in the path of the impetuous horse, he barked with all his might; and his well timed cries, saved, more than once, the arms and legs of those, who, but for this premonition, had been run over by the carriage wheels.

It was observed (says the author of this recital) that this intelligent dog never barked when the coachman was sober—his silence therefore, tranquilized the fears of the Marchioness when she ascended her carriage, while his barking filled her with the most lively alarm; so that she frequently desisted from paying visits of importance, not being over anxious to confide in a coachman, whose senses were entrusted to a dog.

The late celebrated George Alexander Stevens gave the most solid reasons why ladies pleasure should use paint, with an exclusive privilege to themselves, which was the example of *Pirates*, who make it a rule to fight under false colors.

The mischief done to the community of the obliging ladies, by such of their sex as disdain correspondence with them, and yet invade their rights, by painting their faces, has brought together a Congress of the most renowned of the class, who prudently considering the impossibility of suppressing the encroachment entirely have passed a few rules to restrain and regulate the practice. *Acadian Recorder.*

Among the hills, (270 in number) passed the last session of the British Parliament in 1815 last were the following:—25 relative to public revenues—6 for mitigating the poor code—6 for the regulation of trade—2 for repeal of taxes—14 for enclosing waste lands 70 for making and repair of roads—3 for building bridges—10 for establish gas companies 6 for building churches, and several for regulating trusts of charity. *ibid.*

Female Giggers.—The giggers belong to gregarious tribe of animals. They, genera collect in corners to the vast annoyance of forlorn looking people, who, however wor or intelligent must not hope to escape the nomination of quizzers, and consequently become lawful prey. It has been observed that the appearance of a beau increases the merry consitions of these pretty giggers.

Mrs. West's Letters to a young Lady.

We should not reject the friendship and vices of any man merely because he differs from us in opinion. In public affairs there is no such perfect coincidence of sentiment or opinion. Yet every man is able to contribute something to the good of the community, and man's contribution should be rejected.

A person's wisdom consists, principally knowing the follies and vices to which he is naturally and constitutionally prone, and guarding and fortifying the weak sides of character.

A truly respectable person does not need dress, or splendid equipage to command the reverence to which he is entitled.

The greatest men are men of simple manners. Parade, ceremony, show, and a profusion of compliments are the artifices of little made use of to swell themselves into an appearance of consequence, which nature has denied them.

Politeness may be called benevolence in dress, or the preference of others to one's little occurrences in the commerce of life.

A certain emperor, being reproached for warding, instead of destroying his enemies, replied, I destroy my enemies, by making them friends.

TERMS OF THE FARMER.

Published every Saturday, at THREE Dollars per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

NEW ENGLAND FARMER.

PUBLISHED BY WILLIAM NICHOLS, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. II.

BOSTON, SATURDAY, FEBRUARY 7, 1824.

No. 23.

Boston, Jan. 29, 1824.

To the Editor of the New England Farmer.

SIR,—I am induced to request the publication of the following letter from T. A. Knight, Esq., President of the London Horticultural Society, as a just tribute to him for this repeated proof of his regard for this country, and his desire to communicate to us, some of the finest fruits, recently introduced into Europe.—I had barely stated to him, that I was apprehensive that some of those which he sent to us last spring would fail, and will be seen that he has promptly offered to send out duplicates of them all the ensuing spring. The least I can do, in such a case, is to make known his liberality. I have distributed, in the course of the last summer, more than two hundred buds of those which he sent; and I have promised many scions the ensuing spring. Should the new parcel arrive safely, I hope to be able to give them a circulation as wide as the liberality of the donor could desire.

That part of his letter which speaks of an ear of sweet corn sent by me to him, has reference to a question recently discussed in Horticultural Transactions, relative to the effect of the farina or pollen, of one variety of corn upon another of the same species; some of the writers contending, that a change is effected in the fruit the same year by the interchange of the farina, while others maintain that the effect is only visible in the fruit produced from the seed in subsequent years. Mr. Knight invariably maintained the latter opinion, in which I fully coincide. I sent him, however, an ear of our ear of corn, which I thought might be an exception. The kernels of that corn, it is well known, are white and shrivelled; but on the ears which I sent, there were several kernels of plump, yellow corn. This explanation will enable the reader to understand this part of Mr. Knight's letter. It will be seen that he does not consider this an exception to the general rule, for the reasons he states.

I am, Sir, respectfully, your humble servant,
JOHN LOWELL.

Downton, near Salop, Wales, Oct. 23, 1823.

MY DEAR SIR,—I am sorry to hear that the letter I addressed to you, arrived in so ill a way. The value of them to me was very trifling, and I shall have much pleasure in sending you more trees in the next spring, and till you are in possession of the different varieties, which I am satisfied you will find a great acquisition to your gardens and orchards. I should have written sooner to express my wishes to send you another box in the spring, but I have waited to receive a letter, which you proposed to write to me, to say what varieties had succeeded, and what had failed. I still hope to receive a letter before the spring, that I may not be wanting anything, which you already possess. We have recently introduced a variety of apple from the north of Italy into the Garden of the Horticultural Society, of which the Belgians as well as Italian Gardeners speak in rapturous terms: and Galesio, the author of a splendid publication of delineations of the Italian Fruits, has placed this apple first, at the head of the list of Italian fruits. And a Belgic Gardener describes its flesh to be as rich and melting as that of the finest pear. I have only obtained a few

buds of it for insertion in the last season, but I propose sending a budded stock to you.

I thank you for the ear of Indian Sweet Corn which you were so kind as to send me. The facts you state are very interesting; but they do not present to my mind anything anomalous.—The color of the seed coats in the blue and yellow grains is not changed. It is the matter which composes the cotyledons only, which acquires a tinge from the operation of the pollen.

An English gentleman, by the name of Goss, has pointed out, in the Horticultural Transactions of the present year, a similar change in the color of the Prussian blue pea; a variety cultivated in our gardens, of which the color of the cotyledons is a dull blue, which is seen through a white skin. Mr. Goss conceived erroneously, that he had changed the color of the seed coat; but I have, in a subsequent communication shown that he has drawn an erroneous inference; and that the seed coat of the pea, or of Indian Sweet Corn retains the same color, which it would have presented if its natural pollen, that of the plant itself, which afforded the seed, had alone been present. I planted a few of the white shrivelled seeds, taken from the ear you sent me, soon after it arrived, and I have kept each plant wholly separate from any other; and all the seeds (which have been some time perfectly ripe) are white and shrivelled. You will probably think that I have been very expeditious in obtaining ripe seeds. But we do almost every thing here by machinery; and I have a couple of dry stoves, which are always kept at a very high temperature; and into those I introduced several plants in succession, as their periods of shewing blossoms approached, suffering one only to bear its male flowers at a time. I have of the plants, growing under glass, in a lower temperature: But those have not yet ripened their seeds. The sweet Corn, in its immature state, must be, I conceive, a most admirable vegetable. I beg to assure you that I did not make the foregoing experiments under any doubts of your accuracy. On the contrary, I have given you full credit for perfect accuracy; and I think the habit of hearing from many correspondents, some of them certainly not accurate has given me a facility of distinguishing Truth from Falsehood in the statements and opinions of such correspondents. I have, in the present year, seen a great number of new seedling nectarines, obtained from experiments, purposely and scientifically made; and I have got one or two varieties of, I believe, unprecedented excellence.—But your climate is, I believe, too hot for the melting varieties of the nectarine.

I remain, my dear Sir, sincerely yours,
T. A. KNIGHT.

FOR THE NEW ENGLAND FARMER.

REMARKS ON SEVERAL SUBJECTS RELATING TO RURAL ECONOMY.

[Continued from page 196.]

6. Green Corn. Sentiments, feelings, and practices of particular application are often relinquish-

ed reluctantly and slowly after the occasions which called them forth are passed away. People do not discriminate between the general laws of conduct, and the application of them to particular circumstances. We have a striking illustration of this in the subject of the present communication. When our pious and good ancestors came into this country, one of the greatest of their concerns, and that which was attended with the greatest difficulty was to provide for comfortable subsistence in the winter. Many times, as it is well known, they were not able to do this, so as even to preserve the lives of all. One of the most comfortable and substantial articles was *Indian Corn*. This, from its nature could be preserved, and furnished them as it does their descendants, with very wholesome food, when the snow is scattered like ashes on the earth, and the frost has sealed up the waters. Under the circumstances in which they were placed, the preservation of this article was connected with the hope of life. There was nothing else on which so much dependence could be placed. While in summer, means of subsistence were more easily provided, and many things which at that season are good for food would of course decay before winter, and must therefore be used at the time, or lost. To raise Indian corn was to provide for the preservation of life; to use this in summer was to be unmindful of the calls of winter, because if this failed them there hope was gone.

These circumstances made it, not only in the estimation of these good men, but in reality a sin to break down and use that article in its green state; for thereby life was endangered. And these pious men felt as they ought to have felt that it was their duty to forego present enjoyment, when likely to result in such future sufferings. But when the general truth that it is the duty of all to preserve men's lives, was adapted to the exigencies of the occasion, the rule and the application were confounded, and a feeling was excited averse to the use of corn in a green state, which continued for many years after the exigencies of the times had passed away. I presume there are but few of middle age, who cannot recollect having been taught that it was not only very uneconomical, but in some way wicked to indulge in this luxury. They have felt a kind of misgiving, when on special occasions, they have ventured into the field, and torn down the bleeding ear. And even to this day there are not a few who experience the same kind of feeling for the best of reasons, they have the same sentiments. And there is something interesting in this, for it shows that a strong hold moral and religious culture has on the mind.

But though we ought to abstain from whatever is forbidden, we ought not to deprive ourselves of what God, in his goodness, freely gives us to enjoy. Though we are unspeakably indebted to God for this golden harvest, yet such is the rich and boundless provision he graciously makes for us, that the preservation of our lives is not dependent on this article almost alone. It may accordingly be used freely in

summer, and yet enough be left for the wants of winter.

The only enquiry of importance, now, about the use of Indian corn, in its green state, is whether it is profitable—All allow it to be pleasant. And in regard to the profit, I have no hesitancy, after much trial and investigation to say that there is no time, when the same corn will furnish more actual support and nourishment to the human frame than when in the proper state for boiling—That at no other time is it prepared for the table at so little expense, and that in its proper season it is never more healthy, than when it is green at whatever part of the day it is used—That it may, with perfect safety be served up at each meal, make the entire diet of grown persons or children, without, in ordinary cases the least unhappy result, but on the contrary with good hope that it will preserve against these complaints, which are most apt to prevail at the season, when this is in its greatest perfection—That at the time when corn is fit for boiling, and at that time only, every part is valuable for food, and will by swine or cattle be entirely consumed. And further, when there are two ears upon the same stalk, by taking off the first and fullest, the second will arrive at much greater perfection than it otherwise would; and that in the aggregate their is a larger yield than would otherwise be—And that upon the whole there is health, pleasure and profit in making a free use of green corn, in its season, and that there is not, as some have, with a kind of pious error supposed, a sort of wickedness in the sober and temperate use of it.

The corn most suitable for this purpose is the sweet corn, which is easily raised, and may with proper management be had about two months in the year, in quite a state of perfection. This is to be done by using early and later seed, planting at different times, and on different soils, and the use of different manures. If persons are desirous of getting it earlier than this will give, they must take a different kind, but none, I believe, can be had later. Late in the fall, it adds much to its sweetness to boil it in the husks, which are to be left on till it is used; and in this way it may be used a considerable time later than it can by a different process.

AGRICULTURAL STATEMENT.

To the Trustees of the Plymouth County Agricultural Society.

GENTLEMEN,—The writer has been at an expense of about \$100, on an acre in reclaiming a quantity of watery and boggy land, situated a few rods from his house;—and he has not yet repented.

His experiment has been particularly calculated to show, independently of a large use of manures, the strength of swamp-soil, when subdued by draining, and repeated ridge-ploughings.

In the following paper he gives a statement of the condition of the land, when he commenced improvements, of the methods used in reclaiming it, and of the products from year to year. If the Gentlemen Trustees, should think this paper, or any extract from it worthy of publication, they have liberty to publish it. If they judge the communication to be undeserv-

ing of the public eye, it is hoped they will have the goodness entirely to suppress it.

Gentlemen, very respectfully, Yours,

CHARLES MACOMBER.

The swamp was formerly wet, miry and reduced to a rough state by the treading of cattle; was covered with blue flag, yellow moss a few bushes and a yellowish wiry kind of swamp-grass. White clover appeared on the higher hillocks made by the treading of cattle in the drier parts of the swamp; which induced me to think, that the soil in itself might be good. The greater crops however have not been on the drier parts of the swamp, since it was drained; but on the more wet; and the greatest crops of all have been on a part of it, which was a quagmire, and where formerly cattle were mired, and assistance from neighbors was necessary to drag them out.

On examination, the soil of the swamp appeared to be a dark mould, a part of which had undoubtedly been washed down by rains from the neighboring hills during the lapse of centuries, mixed with vegetable matter, as grasses, moss, flags, bushes, shrubs and trees, in all the various stages of decay. In running the ditches through the more wet parts of the swamp, the workmen cut through logs, and roots of trees, most of which were so much decayed, though they retained some of their former appearance; that the shovel passed through them with as much ease, as through places, where there was merely a blackish mould.

I had conceived the design of making English meadow of the swamp in the year 1818, and commenced digging the ditch at the outlet; but it was not, till the year 1819, that I did the chief of the ditching. To ascertain the best method of ditching, I sounded the swamp with a long crow, and found the soil above the pan, which was a hard stratum, composed of gravel and clay, to be from 1 to 6 or 7 feet in depth, and near the middle of the swamp to be a bog, shaking beneath the feet.

In the year 1818, I dug the ditch at the outlet, using the crow, and plough to break up the hard pan, which lay at bottom, a distance of eleven rods and a half; so as to drain off the greater part of the water from the bog leaving only 6 feet 7 inches of watery mud in the deepest place. I declined digging the ditch at the outlet deeper, so as completely to drain the bog, fearing the soil might become too dry. My apprehension was not without reason; for I found on the subduing of the bog, that there was formed at the surface a hardened soil of 2 feet 3 inches, sufficiently firm to bear a plough with a yoke of oxen, which hardened soil seemed to rest, or rather to float, upon a soft mud beneath, which as I said before, was 2 feet 7 inches in the deepest place.

In 1819, I had the main ditch run up through the swamp, nearly straight through the deepest part of the bog. From the side of this ditch I dug another main ditch, crooking so, as to pass through the lowest parts of the swamp with a view of carrying off the water from a multitude of springs as well, as water descending from higher grounds. The only instrument, which could be used to digging through the deeper parts, was the shovel. Where there were not more than 18 inches of soil, the plough was used to loosen the soil in the ditch, and the instrument, called a scraper, was used to remove

the earth. In this mode of ditching there is great saving in time and expense, and this mode is undoubtedly preferable, where the depth of swamp soil is not so great, as to prevent the use of oxen.

On each side of the straight ditch first made and nearly at right angles with it, I dug lateral ditches at such a distance from each other, to admit of the mower's taking four swaths between ditch and ditch. More than two thirds the swamp I ditched in the manner named; the remainder, as the soil was not deep, and seen pretty dry, I did not ditch at all.

The main ditches I designed to have 5 feet wide at top, and narrower at bottom. To have them of this width, when the soil became settled, I was obliged to dig them much wider where the soil was deep, and yielding; and in one place, if I had dug the ditch 10 feet wide at first, I think the soil would have fallen in much in settling, that it would not have been too wide. The lateral ditches I dug proportionally narrower, as the depth of soil happened decrease; throwing the ditch earth into middle spaces between ditch and ditch.

In this state the swamp remained gradual settling and becoming harder, till I ploughed without difficulty during a drowth in the autumn of 1820; and after ploughing had the ditch carefully cleared out, to promote the drying of the soil.

In the spring of 1821, a most unfortunate time for cultivating a swamp, for it rained almost every day, or every other day, I began my operations for planting it with Indian corn and potatoes.

That part of the swamp, which on account of its having been drier, and the soil not so deep I had not ditched, I found so wet and springy that it seemed impracticable to plant it. Unwilling to be baffled in my attempt I went in with a light plough, 2 yokes of oxen and a horse and ridge-ploughed it, wallowing in mire 12 to 13 inches deep. By repeated ridge-ploughings I threw up this part of the swamp into ridges of such a breadth, as to admit of four swaths on a ridge in mowing, and of such height, as to throw the water into the spaces between ridges; where it ran the length of the ridges, and emptied into a lateral ditch, on one side of the field extending across to the main ditch.

Some of the spaces also between the lateral ditches were so wet, as to be unfit for planting. These spaces, which had been made of a brea to be mowed at four swaths, I divided by ridge-ploughings into two ridges, each of a brea to be mowed at two swaths. Thus by repeated ridge-ploughings I saved much expense in ditching, and at the same time pulverized the soil and reduced it to a fine tilth. There is no other farming tool, half equal to the plough ridgeing wet land. There is no other instrument that leaves the soil in half so good a state. "Venerate the plough" therefore, and use where it can be used.

The spaces also between the lateral ditch which on account of wetness required not to be divided into two ridges by ridge-ploughing nevertheless ridge-ploughed, making of each these spaces one wide ridge; and this I did merely to make the soil drier, but to reduce to a desirable fineness.

From the New Hampshire Sentinel.

CHESHIRE AGRICULTURAL SOCIETY.

At a meeting of the Cheshire Agricultural Society, Col. Drew's on the 7th instant, the following premiums were awarded:—

To Samuel Grant, Esq. of Walpole, the first premium offered by the Society for the best re of Wheat raised on old ground. The produce of the acre was 31 bushels and 14 quarts. The following is from the statement furnished by Mr. Grant.—The soil, a dark loam, rather dist. The land had been improved as mowing out 15 years and had on it eleven full grown apple trees. In the fall of 1821, fifteen loads of barn manure were carted on to the land, read, and the land broken up. In the following spring the land was cross ploughed and harrowed, and a part sowed with peas, and the residue planted with beans and corn. The peas were harvested in July, and the part of the ground on which they grew ploughed, the beans were harvested in August, and that part ploughed. The corn was harvested 20th September and the ploughing completed. The whole was then harrowed and ploughed, harrowed again, and sowed on the 25th of Sept. with one bushel and an half of seed, washed, and the whole wet mixed with three quarts of slacked lime; and again harrowed, and bushed each acre.—After the ground was frozen, about forty sheep were permitted to feed on it two or three years.

To Thomas Bellows, Esq. of Walpole, the first premium upon rye, raised upon old ground. The quantity raised was thirty-seven bushels and 15 quarts on one hundred and fifty-six rods of land. No manure except about 2 or 3 bushels of Plaster had been applied to the land since 1804. Since that time, with the exception of three or four crops of rye, it has been used as a sheep pasture. The land was ploughed in June 1822—cross ploughed in Sept.—harrowed and sowed with one bushel and half peck of seed, and twice harrowed.—The above piece was a part of a field of seven acres of plain land, sowed at the same time, two or three crops of which were supposed to be equal to the first measured, the residue but little inferior to it. To Doct. Luke Howe, of Jaffrey, for the best Essay on Manures, a premium of ten dollars.

Per order

TH. M. EDWARDS, Secretary.

From the Boston Patriot.

HOROLOGY.

It is highly gratifying to observe the truly valuable and economical improvements, that have been made by our young townsman, Mr. Harrison G. Dyar, in this scientific branch of mechanics, and that they have been acknowledged by all competent judges, worthy of the most qualified approbation. Here is another remarkable instance of the force of early genius these inventions being the fruits of his leisure hours, wherein he has intuitively achieved improvements, which the veterans in this scientific art have for the last century, sought for in vain, viz: The more perfect and simple suspension of its vibration in the cycloidal curve—producing 9-10ths of the usual friction—half the number of wheels—and effecting a more perfect uniformity of time and square in all its movements.

The numerous orders already received for these improved time keepers, fully evince the general opinion in their favor. The correct principles upon which these inventions are founded, together with their simplicity, durability and cost, are evidently their peculiar characteristics. One striking instance of their economy is, that a town clock made to run a year, with all the improvements, may now be purchased for the same sum that would be necessary to pay for the service of winding up an eight day clock, upon the usual construction.

A friend to Native Genius.

AMERICAN SALT.

We are informed that six hundred and ninety thousand bushels of salt have been manufactured at Salina, during the last year. The most of this has been made in the old method of evaporating by boiling—the two companies, (Mr. Eckford's of this city, and that of the Messrs. Roaches of New-Bedford) which are making extensive preparations to manufacture salt by evaporation by the sun, not yet having completed their works. When these shall be in successful operation, we have no doubt that salt enough will be manufactured at that place to supply half the United States. Dr. Van Rensselaer in his Essay on salt, lately published in this city, states that "in the United States, 1,200,000 bushels are produced annually, and this is a small quantity compared with that which might be had. Yet we import annually upwards of four millions, leaving a balance of more than \$2,800,000 against us. In Missouri, Illinois, Arkansas, Ohio, Virginia, New-York and Pennsylvania, salt can be produced in the greatest abundance."—*N. Y. Com. Adv.*

From the Massachusetts Spy.

Sulphur a Preservative against Measles.—During the winter of 1817, the measles prevailed epidemically at Munster. Children affected with the itch, who were using sulphur externally and internally, were exempt. In 1822, measles occurred again, preceded for many days by a convulsive cough. For this symptom I prescribed flowers of sulphur and white sugar, half a tea spoonful. Many trials were made on children of different families and ages, and all who took it in time escaped the disease.

M. TOURNAI.

Horace A. Hayden, Esq. of Baltimore, has discovered that the empyreumatic oil which comes over in the distillation of pyro-ligneous acid, is peculiarly valuable for preserving anatomical preparations. "Imbued with this oil, the animal textures seem entirely defended from all the changes of time." The acid is sold by the manufacturers for 25 cts. per gallon.—*Ibid.*

To make Strong or Bookbinders Paste.—Mix wheaten flour first in cold water, then boil it till it be of a glutinous consistence; this makes common paste. When you wish it to be of a stronger nature, mix a fourth, fifth or sixth of the weight of the flour, of powdered alum; and where it is wanted of a still more tenacious quality, add a little powdered resin.

To make Opodeldoc.—This well known liniment is prepared by digesting three parts of Soap in 16 parts of the Spirits of rosemary, till

the former be dissolved, when one part of camphor should be incorporated with the whole.—This unguent is of great service in lumbago, rheumatic affections and similar painful complaints; but being very volatile, it ought to be kept in bottles closely stopped, to prevent the access of air.

Oyster Shells.—The shells of the oyster, like those of other crustaceous fishes, are composed of calcareous earth and animal glue. They possess no medicinal virtue superior to common lime stone or chalk; but by calcination, they yield a quick-lime, which is perfectly free from any metallic or other fossil substance; and being less permeable to water, when mixed with sand, it is better calculated for the plastering of walls in damp situations. Hence the Dutch prepare their excellent mortar generally of marine shells burnt into lime; which makes a most durable cement. The great importance of this fact in point of health and economy deserves equal attention; so that the immense number of oyster shells, annually thrown away in cities, might easily be converted into a very useful shell lime.

Fredericksburg, Va. Jan. 10.—A correspondent in the country, of unquestionable veracity, writes to us as follows:—"On Sunday the 11th inst. about the hour of midnight, when my family had retired to bed, and nearly all in a profound sleep, I was surprised at the violent barking of a faithful watch dog. So great was the alarm, that he ran against the door I was approaching, as if pursued. On opening the door the light of the fire warned me of my danger—it was bursting through the roof of my house directly over the room where I had three daughters in bed, and would most certainly have fallen victims to the flames had it not been, under Providence, for the sagacious dog. The wind was high, and being weak handed, it was with great exertion the house was saved. The fire was the effect of accident originating in carelessness."

Manufactures.—Patterson, N. Y. is famous for its manufacture of hemp, flax, and tow cloth, &c.—Three hundred thousand dollars have been invested in the buildings and machinery for making those articles, and they are fabricated in unrivalled perfection. They are able to furnish 12,500 bolts per annum, which will directly employ 300 persons, and furnish a market for 300 tons of flax. The price of the goods is very moderate, and the cost of the foreign articles has been reduced by the success of the domestic manufacture.

Niles' Register.

Samuel Maverick, Esq. has announced, in the Pendleton, S. C. Messenger, that in a late tour to the Eastern States, he has collected upwards of fifty new varieties of the Grape Vine, with many other rare and valuable plants, for the use of the agriculturists of that part of the State. He has also succeeded in bringing safe home a genuine *Tea Plant*, direct from Canton, in China, by way of New York.

New article of "Domestic Manufacture."—Last week was obtained from the Bank in this village, on that between two and three thousand dollars, being the proceeds of sales of Oil of Peppermint, manufactured in the town of Phelps, by F. Vandemark & Co. the past season, and sold to a person in Massachusetts.

[General, N. Y. paper.

Large Hogs.—Mr. Oliver Chickering, of Shrewsbury, recently killed a hog, 19 months old, weighing 650 lbs. Another, owned by Capt. Gershom Wheelock, 20 months old, weighed 584 lbs.—*Mass. Yeoman,*

Extracts from "An Address of THEODORE SEDGWICK, Esq. delivered before the Berkshire Association for the promotion of Agriculture and Manufactures, at Pittsfield, Oct. 2, 1823.

[Concluded from page 214.]

"There is one topic, fellow-citizens, that has so important a bearing, upon your comfort and prosperity, that I need no apology for suggesting it; I mean the expediency of building in brick or stone, instead of wood. A good farmer has, or desires to have, a snug, tight, comfortable house to live in. Mr. Jefferson as early as the writing of his notes on Virginia, calls the attention of the country to the subject, and regrets, that we should so generally have adopted the practice of building wooden houses. In the first settlement of the country, this was in a great measure unavoidable. The case is now reversed, and I am satisfied by repeated enquiries of builders and others, that where there is clay for brick, and the soil is gravelly, and does not require the driving of piles for a foundation, that a house may be built of brick, as cheap as of wood. There is a common impression in the country, that a brick house is damp and unwholesome, and that may possibly be the case if the foundation is in clay, but otherwise I am satisfied, that it is an error, provided the house is rightly built. If this objection be removed, can there be any comparison in value, between a brick and a wooden house? The brick house in a climate alternately intensely hot and cold, is both warmer and cooler. Then if the brick be good, and rightly burnt, it does not require painting at all. The brick houses in Philadelphia are not painted, and I know that the old brick houses in Albany, were never painted. But these brick in Albany came over sea, and how much better they may be for the voyage, I cannot say. If a man has a brick house, he has property, it is a thing that stays, he has something for his son, and his grandson, and he has something that a man will buy and pay for, if he himself is seized with the western fever. Really, this is a country to stay in, and not flee from. There is many a wooden house in this county, of not more than fifty years standing, that is abandoned, except by the bats and owls. Who does not desire to abandon a house, glazed with old hats, roof decayed, clap boards worm eaten, sills rotten, or half rotten, so that it stands up and down, like a snake in motion, or sits on one end, like a horse upon his haunches. It would not be easy to estimate the increased value of the property of New England, if the money now invested in wooden houses, was in brick, and I am satisfied, that the permanent prosperity of the country, is deeply concerned in this subject. Thus far, fellow citizens, and farmers, I have been pleading the cause of your interests, and I am now to plead, not for your interests merely, but for the cause of humanity, of morals, of religion, which last, the dearest and most important to us all, should sum up the whole, and include all other considerations. I mean the character of your common laborers, day laborers, the men who live from hand to mouth, who generally have neither house, nor land, or home. This class in all countries, is the most helpless, dependent and ignorant, and therefore as they can do least for themselves, they on that account become more worthy objects of public and private benevolence. In other countries, a man's birth

generally decides his fate, as to the rank he is to hold in society; as he is born, so he lives and dies. To attempt to raise him out of his cast, to a higher, would be thought quixotic, and a disorderly effort, to subvert the foundations of society. Among us the case is reversed, we desire to raise the condition of all men, and to begin in the right way, by inspiring them with a love of property and distinction, and the fact is, that some of the most eminent in the land, have carried axes on their backs, and now in the prime of their honors and usefulness, are not ashamed to tell the story of their early career. I say the love of property and distinction, for we must take man as he is, and build upon the foundation, which God has laid. For you may observe in the general, that 'till you have inspired a man with this passion, you can make nothing of him. No, nothing. 'Till then, he is a miserable creature, as often without, as with, shoes or stockings, he has neither cattle, nor a house nor land; he is a vagrant, wandering over the fine face of this beautiful earth, finding no rest any where; the common ties of kindred he discards, whether it be father, brother, or stranger, it is all one, to him. He is greedy and selfish, for he has nothing laid up in store, and nothing to give; he is a nuisance to society, for he has no stake in it. All attempts, therefore, to elevate individuals, or to build up societies, without great reference to this passion, is nothing but fruitless struggle and effort, and a contradiction to nature. But can you inspire a drunkard with this passion? He who wastes all, whose body and mind crumble before this frightful disease of drunkenness. We have been called a *drunken nation*, and the fact being, that as in no country is this vice more prevalent, we may well distrust the result of all religious and benevolent efforts, 'till we are able to stem the torrent. Our duties here, therefore, as is commonly the case, lie before our eyes, and at our doors. We need not go from home to find one of the most pressing objects of charity. It is the condition of the day laborers, generally, I do not speak of all—their education, their religious instruction, and most especially, that of their children. We look to the law for a remedy, and hope that the national government will lay heavy duties upon ardent spirits, so that the people cannot buy the rum, or that the state governments will diminish the number of groceries and taverns, (as though a man, who is in chase of what will get him drunk, will be deterred by being compelled to turn a corner, and go a few paces further) or we call upon the selectmen, to put in force the law against drunkards. All this is childish. The law can do no more than partially protect the property of intemperate men, and secure it for their wives and children. Even this has generally been found a fruitless effort. The law never did nor never will counteract the vicious habits of society, that consist in *indulgence*. Who ever heard of a temperate, chaste society produced by law?—No, it is the public sentiment, the moral feeling, the religious coercion, that is to afford us any hope. It is not uncommon for a laboring man to drink a pint of rum in a day, and this too of cider brandy, one of the most loathsome products of the beautiful fruits of the earth, and I have been credibly informed, that a set of laborers in the harvest, have been known to

drink a quart per man all round, and by the poor wretches think to make themselves *strong*. No, it is *fool*, and not *drink*, that makes a man *strong*. And the proof lies, in the fact that a laboring man, who is not diseased by intemperance, will drink his pint a day, and still eat ravenously three times in it. This, together with the fact which every one knows in general, that this drink does not diminish the appetite, is proof positive against all the chemical analysis in the world, that in a man's stomach, a quart of whi-key made of rye, is equal to a solid quart of good rye bread, or any assignable portion of it. No, the human constitution is such, that *drink* in its common form is one thing, and *food* is another. I know that many of our farmers justify themselves in the quantity of liquor allowed to their laborers, by the opinion, that they cannot get the work without it. This is a mistake, for there are instances of great farms being managed, without the use of any spiritous liquors whatever. In the county of Westchester in New York, a premium is adjudged to the individual who cultivates the largest number of acres, without the use of ardent spirits. There is a right and a wrong way in every thing, and it is the way, in which these indulgences are denied, that defeats the object. Let it be done, not from niggardiness but a tender fellow-feeling for the man; give him in moderation, for in moderation, the thing may often be good—let him see that; what you save in liquor, let it be made up in desirable food, a good dainty luncheon, at 10 o'clock, another at four, if he wishes it; *these will make him strong*. The condition of the laborers, in one respect very different from your *gentle man* drunkard. His case is hopeless. The moment that he drinks to excess, he is diseased, he bloats and dies. Not so with a laboring man, he will drink a great deal to day, and be the worse for it, but by to-morrow at ten o'clock, his strength is not yet impaired, the rum is fairly worked off, and he is ready to begin again. Within my own experience, the laboring man who drinks to excess, is the only intemperate man, of whom there is any hope. For 'till he has proceeded to a certain extremity, the excitement of ardent spirits is not physically necessary to him. When that takes place, it is all over with any man.

"There is no higher obligation under which an independent farmer lies, than that, of a strict, moral, religious attention to his laborers. To understand the nature of this, he must first know, that he himself is not to be ignorant, for an ignorant man can teach no one. Intellectual pleasures best secure a man against the pleasures of vice. The standard of knowledge among our laboring people is low, compared with what it should be. It would be quite contemptible to suppose that the farmers are to study latin and Greek. But it is desirable that they should be well versed in all the knowledge that belongs to their occupation. There is time enough for it. A laboring husbandman, who is reading and studying what belongs to his art, is pursuing the most interesting of all knowledge. It is the mystery of nature, in the soil, the plant, the fruit, the seed, the elements. Why should not our children be taught it, and why should not the laboring man have the books, which give him this knowledge? But the time, the time, who has it? No husbandman has it in the

son of hurry and harvest, for the harvest
ows no hours, and a man must then work, 'till
o'clock at night if safely to his crop requires.

Let him save five dollars out of his gin and
n, and cider brandy, and buy that amount of
d books this year, and as many the next, and
on, and then let him read them in the long
evening, that pass from October to
rch, when he is neither sowing nor planting,
r attending to his cattle, and when he would
erwise be dawdling about, drinking ginger
cider, and doing nothing. He will find there
time enough; he will increase his capital
b the least disbursement; he will give dignity
his occupation, and best secure himself against
aptations to intemperance. God requires
every man, the best use of his time and
ents. It is only by an intellectual and reli-
ous cultivation of our people, that we can res-
our country from the deep dishonor, under
hich we lie, in being called a nation of drunk-
s. Let us scorn those base maxims of the
ld, by which it has been held, that a labor-
man, must of course be vulgar and ignorant.
ow-citizens, consider your blessings, com-
ed with any other people. Look at that
ntry from whence we came, paralyzed by
urthens that have followed war and extrava-
gance, showing at once the most frightful of all
raditions, a nation sinking under the
ht of riches and poverty; look at multitudes
of their laborers, patient, self-denying, so-
berate, at sun rise the man is in the field, at
t o'clock he breakfasts upon bread and wa-
h his dinner is bread and water, and his sup-
per nothing more. Compare this with your own
and luxuries, and endeavor to make the
requisite to God in your power, by the
best moral, intellectual, and religious culti-
vation of yourselves, and your laborers."

from the Massachusetts Agricultural Repository.

ON THE MANAGEMENT OF FRUIT TREES.

As this is the branch of agriculture least un-
derstood in our country, it has seemed to me
no number of our Journal should be issued
without some hints on that subject. No sensi-
ble man would pretend to place it in competi-
tion in point of importance, with either the
general cultivation of the soil, or the raising of
domestic animals of improved breeds. The
primary object undoubtedly is, to produce the great-
est quantity, and the best quality of articles of
food for the support of the inferior animals, and
of man. The second to improve the races of
domestic animals which furnish us food and cloth-
ing. But when these have been brought to per-
fection, and indeed while we are endeavoring
to bring them to that state, we ought not to
neglect those luxuries which our own country
is capable of producing, and which contribute
essentially to our enjoyments. So long as we
spend some millions of dollars for exotic fruits and
vegetables, for foreign wines, oranges, figs,
peaches, raisins, and olives, we ought not to ne-
glect fruits which our own climate will produce and
which are invariably preferred to those which
we import. I hesitate not to say, that in any des-
cription the most sumptuous tables, native apples
and pears of exquisite qualities, are always
preferred and consumed in preference to the finest
exotic fruits. So long as we can place on our
tables delicious native grapes, peaches, apricots,

nectarines, strawberries, raspberries, apples and
pears, the exotic fruits will be only used as orna-
ments to give splendor to the dessert.

With these views we think it our duty to en-
courage our own horticulture, and to lay before
our readers the remarks of foreign cultivators
of greater experience.

The article here inserted was extracted
from a work of Mr. Hayward, and which met
the approbation of the Horticultural Society of
London. It is one of the latest works on this
subject, and is certainly entitled to high re-
spect.

We would simply remark that to those who
read it carelessly it may seem to militate with
the opinion expressed above in noticing the
communication of Mr. Howard, of Bridgewater,
as to the policy of heading down trees—but on
further examination it will be seen to be in en-
tire accordance with it.

The reasons why injudicious and extravagant
pruning of trees is injurious is, that the roots
remain uninjured and calculated for the tree in
its full vigor. They will therefore send up a
superabundance of sap, which finding no limbs
or leaves to receive them overflows, and des-
cends down the bark, is there decomposed and
forms a black mass which we denominate "can-
ker."

But when trees are transplanted, the reverse
of this takes place—the roots are exceedingly
diminished, and are not sufficient to supply the
requisite nourishment to the plant. It is al-
most incalculable, the quantity and number of
minute fibrous roots, which are destroyed in all
transplantations.

Hence there is no sort of discordance in these
opinions, as to the propriety and necessity of head-
ing down or severe pruning in cases of trans-
plantation, and the danger of doing it, when the
roots remain entire. One thought may be sug-
gested, and we believe it to be new, resulting
from this discussion, which is, that when you
prune or graft a large tree or cut off its princi-
pal limbs, it may be useful to diminish its roots
in nearly the same proportion. I am induced to
mention this, because the Green and Hot House
Gardeners are in the constant practice of dimin-
ishing the roots, when they head down their
plants.

COMMENTS ON THE GENERAL MODE OF RAIS- ING AND MANAGING FRUIT TREES OF THE NURSERYMEN.

In the removal or transplantation of trees,
gardeners and nurserymen are generally very
careless and inattentive in taking them up, and
care not how much the roots are broken or less-
ened in number, provided they have enough
left to keep the tree alive; the consequence is,
that although the branches left on may remain
alive, there is so great a deficiency of sap, from
the loss of roots, that the vessels cannot be fil-
led the following spring, therefore they contract
and become inflexible, and after one or two
seasons are incapable of extension; so that
when in the course of time the roots are re-
stored, and the sap supplied in the usual quan-
tity, it is, from being restricted in its former
course, impelled through the nearest vertical
and accommodating buds that offer.

Hence it will be seen, that in almost all trees
trained in the common way, the first branches
which were trained in, and are the most hori-

zontal, are the smallest and weakest, and in con-
sequence incapable of bringing fruit to perfec-
tion; and as these occupy the best part of the
wall, the strongest and most luxuriant shoots,
by being trained erect, quickly grow out of
bounds, and are annually cut away.

Thus the strength of the tree is wasted, and
the continued efforts of nature to produce fruit,
in proportion to the age and capacity of the
roots, is obstructed, instead of being forwarded
and assisted.

It is this effect that induced the practice of
heading back young trees, on transplanting;
and under such circumstances it is certainly a
proper and necessary method.

Trees that are not headed back, after the usu-
al mode of transplantation, such, for instance, as
half trained and full trained trees from the nur-
serymen, are found to throw out their strongest
shoots immediately about the stem or trunk,
and notwithstanding these are removed, this
and every other attempt to force the sap into
the old branches is vain, its nature will remain
the same; and a vigorous head cannot be re-
stored, but by a removal of the old branches.

This shews the impropriety of the present
practice of heading back and training trees in
the nursery ground.

As it is a general custom for those who plant
fruit to rely on the nurseryman for the produc-
tion of their plants, it becomes an object of the
greatest importance to enquire, how far their
general practice is adapted to public utility.
And I feel no hesitation in stating, that this busi-
ness is conducted upon such imperfect prin-
ciples, that it is almost impossible to find one
plant in twenty that is worth transplanting.

It is obvious, that unless the original plan or
foundation be good, a perfect superstructure can-
not be raised.

From the deformity and disorder produced in
the nursery ground, almost all our gardens and
orchards exhibit in their trees a complete con-
trast to the beautiful simplicity and bountiful pro-
duction provided for by Nature.

Before, therefore, any thing like perfection
can be attained by the gardener, a reformation
must take place in the practice of the nursery-
men.

The first operations of the nurseryman I will
consider to be the transplanting his stocks for
engrafting and budding, and in performing this,
his only object is, that they grow and produce
some kindly luxuriant branches; but as to how
or where, or in what manner, either these or
the roots may grow, he is perfectly indifferent.

Whether the bud or graft produces one or more
shoots it matters not, the whole are cut off short,
or, as it is termed, headed back the following
winter, and such as accidentally produce four
or five branches, so placed as to be fastened, to
form a flat side, are fixed to stakes or a wall,
in the form they are usually trained; and as if
further to insure premature old age, decrepitude,
and deformity, they are afterwards several times
taken up and transplanted in the same careless
manner.

The roots are broken or cut off at random,
and generally either diminished more than one-
half, or they are doubled back and distorted,
and if there be enough left to keep the plant
alive, it is thought quite sufficient; and by these
means the appearance of blossoms and fruit
being prematurely produced, those stunted and

deformed plants are sold as half, or full-trained trees for four times the price of others; and when sold, they are again taken up, and the roots treated and diminished in the same careless manner.

Miller, Forsyth, Knight, and others, uniformly direct that trees from the nursery ground be cut down, or headed back, to two or three eyes, the next spring after planting; and with such plants as here described, there cannot be a better mode of treatment, but this is evidently losing time, and wasting its produce.

Whenever the roots of a tree are diminished on transplantation, the supply of sap must be proportionally lessened: for if the branches of a tree, under such circumstances, are left at full length, the sap vessels, for want of a due quantity to distend them become bark-bound and inflexible; and when the roots are restored, and furnish a luxuriant quantity of sap, this, from being obstructed in its former channels, forms new ones through the buds that offer the most perpendicular position, next the stem or trunk; and although these shoots may be rubbed off, still they form again in the same place, and it will be in vain to attempt supporting the original branches.

A regular head cannot be formed but by a removal of the entire old one; and frequently the vessels of the trunk itself become so fixed and stubborn in the bark, and particularly in standards, as to force the sap out into luxuriant branches near the root.

It has often been made a question and a subject for argument, whether it is better to transplant from a rich to a poor soil, or the reverse; but as the transplanting from a rich to a poor soil even were the roots entire, must cause the bark or sap-vessels to contract, for want of the usual supply of food, and be productive of the same consequences as curtailing the root, the doubt is easily solved.

It may further be remarked, that however diminutive a plant be from poverty, provided the vessels have always been free from contraction, they will readily expand through all the usual channels, and receive and regularly dispose of every additional supply of sap, however great it may be.

NEW ENGLAND FARMER.

SATURDAY, FEBRUARY 7, 1824.

NEW VARIETIES OF FRUIT. We hope that the letter from T. A. KNIGHT, Esq. and the introductory remarks by Mr. LOWELL, which compose the first articles in this day's paper, will meet with that attention from those who are engaged in Agriculture and Horticulture, which their importance demands. The exertions of those gentlemen will be more highly and justly appreciated, when it is reflected that their efforts are entirely disinterested;—they can have no other motive than the consciousness of having contributed to the welfare and enjoyment of their fellow creatures.

Farmers in general are too apt to consider fruit as mere luxury, and therefore pay but little attention to its cultivation. But, although fruit is not absolutely indispensable to the support of human existence, it is a very useful article, and may be ranked among the best gifts of Providence. Mr. Knight, in one of his publications, has well observed that "The palate, which relishes fruit, is seldom pleased with strong fermented liquors; and as feeble causes, continually acting, ulti-

mately produce extensive effects, the supplying the public with fruit, at a cheap rate, would have a tendency to operate favorably, both on the physical and moral health of the people." This view of the subject gives an importance to the pursuits of the orchardist, which few seem to realize.

It is as easy to cultivate the best kinds of fruits, as those which are of inferior quality, and the former are no doubt more wholesome, as well as more palatable than the latter. Besides, by introducing fruit of superior kinds into our markets, and furnishing them in plenty on the domestic board, we render their consumption more common, and cause the most pleasant and most wholesome articles of aliment to be those of most general use. The philanthropist therefore, can in no way better make known his good will to his species than by using his best efforts to cause fruit to be cheap, plentiful, and of an excellent quality.

ON PRESERVING ICE. We have heretofore given directions relative to the construction of ice houses, and as the season has arrived or is near at hand, in which it will be proper to lay in a store of that article we will offer some observations on the subject, mostly taken from Dr. Willich's Domestic Encyclopedia.

The space between the ice-chamber, and the bank should be filled with dry straw, or what is still better, dry shavings* closely pressed. The ice should be collected in the coldest weather; let it be exposed at least one night to the cold atmosphere after it is removed from the water: which will reduce its temperature many degrees if the weather is severe. When put into the house it should be beaten small; and I think it would be useful frequently to sprinkle it with a watering pot whilst putting in: the mass would by that means be rendered more compact. When the chamber is filled, cover the whole with a good thickness of straw, (or shavings, &c.) but I should suppose it would be best to cover the ice first with plank supported by the sides of the chamber, only leaving a door to descend through.

In level situations, where a drain cannot be conveniently dug out from the bottom of the pit, I should suppose it would answer very well to enclose the ice by a mound raised entirely above the surface of the earth, through which the water may be discharged. This perhaps would not be quite so good a repository as if under the surface of the earth; unless the mound was very thick; but I am persuaded that the loss of a few degrees in temperature bears very little proportion to the advantage resulting from dryness.

In Italy, where ice is much used, both as a medicine and a diet, it is formed in the following manner. Balls of snow are wetted, and placed one on another in the ice house. The bottom parcel rests on logs, through the interstices of which the dissolved water drops; and the whole mass is formed into a solid body of ice in the course of the winter.

Fits for ice houses should be dug down to gravel, or have a drain to carry off the dissolved water.

Dr. Cooper gives the following description of "A Portable Ice House."

"A well framed wooden box, six feet by 3 feet. Another wooden box two inches larger every way. Put

* Dry tan, oak leaves, and saw dust have been recommended for the same purpose.

† Some have given directions to break the ice into lumps about the size of a man's head. But it is not material what is the size of the pieces provided they are frozen dry and solid, packed close, and cold water poured on them in cold weather till the whole coheres in one mass.

the smaller into the larger, surrounded by charcoal at bottom and on the sides; a cover to fit close; a hole at one corner to let out the water of melted ice; will cork or plug. At the first frost put in two inches water: add to it during the winter till it be frozen solid; cover it. Throw a blanket over the top. Put under a shed so as to be screened from the sun."

We have been told by a gentleman, who has had some experience in preserving ice, that in making a drain to an ice house there is danger lest the aperture which lets the water out should let the air in, and cause the ice to melt away.—That if the soil at the bottom of the ice house be gravel, sand, or other material of loose texture, no drain will be necessary, as the earth will absorb any water which may flow from the melting of the ice; and nothing more will be needed than to lay on the ground, at the bottom of the ice house, a coating of dry straw, shavings, or other suitable material.

The same gentleman asserts that an ice house should not be kept too close, but there should be a door or other aperture in the north part which should be open in clear cool weather, when the wind is northly, but closed in damp sultry weather.

[Continued from page 206.]

PARING AND BURNING. It is observed by Sir John Sinclair that "paring and burning is to be preferred every other method for reclaiming land, where the soil will produce a proper quantity of ashes. It is proved by experiment that it is much less expensive than clearing the land by tillage;—produces better crops and leaves the land in a better state for cultivation. But where the ground is deficient in vegetable matter full of stones and rocks, or covered with wood, other means must be resorted to.

"It is scarcely possible to improve fen and marsh soils from a state of nature, to that of profitable cultivation, without the assistance of fire. The spontaneous growth is so worthless, that it must be destroyed and that is most readily and effectually done by paring and burning, operations to which these soils are peculiarly calculated. The surface is easily pared;—the soil is more inflammable than any other;—and the turf can be converted into ashes at a moderate expense.

"When land covered with thick tufted coarse grass is broken up and sown, without having previously undergone this process, the old rubbish carries most of the moisture from the seed, and proves a harbor for grubs, slugs, and other vermin. Whereas, when the turf is burnt, these enemies to cultivation are destroyed;—the causes of sterility are removed,—and in its stead fertilizing power is created, which, without the aid of this process, could not have been obtained.

"Many soils formerly cultivated have been subsequently neglected, till their surface has become matted, and unproductive, or covered with a luxuriant crop of useless weeds or coarse herbage. In these cases paring and burning is the proper system to render the soil fit for vegetation. When ever old swards, full matted matter are broken up, they ought always to be treated in that way. But this observation is not applicable to land that has lain only a few years in grass or to any land capable of producing good crops of grain immediately on being ploughed."

Sir John Sinclair agrees with Sir Humphry Davy that sandy soils cannot be pared or burnt to advantage, and observes, "where the soil produces sweet herbage, and contains a just mixture of good earth, where the texture is already sufficiently soluble, paring and burning ought not to be practiced, nor ought to

at will readily harrow to pieces, to be subjected to those processes."

"A new method of 'burning without fire' has lately been discovered. This consists in substituting quicklime for fire. The lime in its most caustic state fresh from the kiln is laid upon the vegetable surface to be consumed; and before it is weakened by exposure to the air, a quantity of water, just sufficient to put it in a state of solution, is applied. This process unites the advantages of burning and liming; and is probably the readiest and cheapest mode of fertilizing soils which are overgrown with vegetable matter, and for which there would prove a suitable manure."—*Deane's N. E. Farmer.*

(To be continued.)

Mr. Webster, we are happy to learn, (says the Providence American) has prepared for the press his latest Speech on the Greek Question, and it was to be published at the office of the Columbian, in a pamphlet form, in the course of the last week.

Prize Poem.—Mr. Charles Sprague, of Boston, is the successful competitor for the \$100 prize, offered by the managers of the Boston Theatre for the best poetical drama, to be recited at the Jubilee to the celebration of Shakespeare. This is the third time in which Mr. Sprague has been successful in similar competitions. Twenty-three poems were offered, some of which are to be very meritorious.

Small Pox.—No new case has appeared in this town since our last paper. Several persons, who have been inoculated for the *kine pox*, were exposed, but none have appeared to have caught the disease.

Lexington no new case of the *small pox* has occurred for more than two weeks.—*Concord paper.*

Fire.—In Savannah, Jan. 19, seventeen stores, &c., were destroyed by fire. Loss estimated at \$75,000. In Columbia, S. C. Jan. 14, property was destroyed by fire to the amount of \$3000. In New-York, two dry goods stores situated in Pearl Street were destroyed.—\$25,000.

FOREIGN.

Letters and papers have been received from Smyrna, dated 22d November. By these it appears that the campaign of the Turks had proved unsuccessful. The citadel of Corinth has surrendered to the Greeks, and the Turkish prisoners had arrived at Asia Minor.—The Greeks had also captured a Turkish corvette, seribriga, a schooner, and some transports. On the 10th inst it is stated that the Greeks had suffered a heavy loss in the Island of Candia, by a sortie of the British garrison of Candia, said to be from 2,500 to 3,000; with the capture of five villages, and from 2 to 3,000 prisoners. The victory, however, is denied by the Greek papers, which state that the Greeks re-occupied the mountains, and compelled the Turks to retreat to their retrainments with loss.

CONGRESSIONAL.

SENATE.—Friday, Jan. 23. The bill authorizing the building of ten *Sloops of War*, for the naval service of the U. S. was discussed in Committee of the whole.

Mr. Lloyd, of Mass. read a letter from the Secretary of the Navy on the economy and convenience of the fleet of vessels. He remarked that not more than five of them would be built the present year if the bill passed; that not more than 4, or 500,000 dollars would be wanted within the year, and that economy in building them would be promoted by this delay, as timber would be purchased, and time allowed for the season. The bill was postponed to Tuesday.

Monday, Jan. 26. A bill for the better securing the stability of public officers was reported by Mr. Bates, of Maine.

A resolution for authorizing the President to send a light vessel to convey the Marquis De La Fayette to his country passed unanimously.

A resolution providing for the biennial election of officers of the Senate passed, after debate.

Wednesday, Jan. 27. A communication was received from the Secretary of the State, in conformity to a resolution of the Senate, passed the 1st of March last, containing a list of the Factories in each state employed

in manufacturing, for sale, such articles as would be liable to duties if imported from foreign countries, &c.

The bill to abolish imprisonment for debt was made the order of the day for Friday.

Wednesday, Jan. 28. The bill to authorize an additional number of *Sloops of War* was discussed in Committee of the whole. Mr. Lloyd, of Mass. Mr. Chandler, Mr. Smith and Mr. Parrot offered their sentiments, and it was made the order of the day for Friday next.

The bill better to secure the accountability of public officers was considered, and made the order of the day for Friday next.

The bill for the final adjustment of Land Claims in Missouri and Arkansas, derived from the governments of France and Spain, passed. Yeas 21, Nays 14.

Thursday, Jan. 29. The resolution, which provides that no person shall be eligible to the Presidency for more than eight years, after debate passed to be engrossed.

House.—Friday, Jan. 23. This day was principally occupied with the Greek question. Mr. Cuthbert of Geo. spoke in opposition to Mr. Webster's resolution. Mr. Clay supported the resolution in an energetic, eloquent, and argumentative speech.

Saturday, Jan. 24. After attending to the ordinary business of the day, the House in Committee took up the Greek question. Mr. Randolph opened the debate in opposition to Mr. Webster's resolution, with an eloquent speech. Mr. Webster spoke in reply. Both these orators exhibited those powers, which have rendered them so deservedly celebrated.

Monday, Jan. 26. After attending to local and private business the Greek Cause was again introduced, and Mr. Smyth, of Virginia, made a long and elaborate speech against the resolution in favor of the Greeks.

Mr. Rich of Vermont, suggested to the Committee whether, considering the diversity of opinion which existed, it would not be advisable to rise without taking any question whatever on the subject. He then moved that the Committee rise, and his motion was carried. By this measure, the Greek question was dismissed, of probably for this session.

Thursday, Jan. 29. On motion of Mr. Webster, the Post Office Committee was instructed to inquire into the expediency of providing by law that the publishers of newspapers, and other periodical journals, may be allowed, in transmitting such newspapers or journals by mail, to accompany them with bills or memorandaums of account, on such conditions and for such additional rates of postage as may be thought proper.

The House concurred with the Senate in the resolution for sending a national ship to bring the Marquis De La Fayette to the United States.

MASSACHUSETTS LEGISLATURE.

SENATE.—Jan. 28. Five bills for incorporating Insurance Companies passed to be engrossed; and a bill establishing limited Copartnership.

A resolve passed to fix the number of the Judges of the Supreme Judicial Court at four. The Hon. Mr. Keyes gave notice that he should move for a reconsideration of the vote. The remainder of the day was spent in attending to private and local business.

Thursday, Jan. 29. A bill respecting Public Worship and Religious Freedom passed to be engrossed.

A Committee was appointed to inquire into the value of the reversionary interest of the Commonwealth in the several bridges over Charles River, South Boston Bridge, Chelsea and Malden Bridges, and to inquire into the expediency of selling said interest in any or all of them, or releasing them to the respective Corporations, on certain conditions.

Friday, Jan. 30. The Governor, by Message, communicated a resolve of the General Assembly of Georgia, proposing an amendment of the Constitution of the United States, that "No part of the Constitution ought to be construed or shall be construed, to authorize the importation or ingress of any person of color into any one of the U. S. contrary to the laws of such State."

Saturday, Jan. 31. A Report of the Joint Committee on the subject of the Massachusetts Claim was received, and ordered to be printed.

Monday, Feb. 2. A Committee was appointed to report on the expediency of repealing the law to restrain the issuing certain printed Fromsory Notes.

The Governor, by Message communicated the proceedings of the Legislature of Alabama in favor of Andrew Jackson, as President.

Tuesday, Feb. 3. The bill to repeal the law, establishing the salaries of the Supreme Judicial Court was rejected. Yeas 8, Nays 25.

House.—Wednesday, Jan. 23. An additional bill for punishing Rogues and Vagabonds was read twice.

A Committee was appointed to report on the expediency of authorizing tenmes coverts with the guardians of their husbands, in the sale of Real Estate held in right of the wife, and to release their dower in certain cases.

Thursday, Jan. 29. The petition of the town of Chelmsford, praying for a law to provide for the annual vaccination of the inhabitants of every town was referred to the Committee on Vaccination.

The proceedings for several of the succeeding days were mostly of a private and local nature.

Tuesday, Feb. 3. The House in Committee of the whole, voted to recommend a non-concurrence with the Senate in giving leave to the Amherst Institution to bring in their bill for a Charter. Yeas 108, Nays 91.

Erratum.—In our paper of the 24th ult. page 206, 2d line from the top, an awkward error escaped our notice till too late to correct it in that paper, or the next succeeding one. Instead of "might to original matter," it should be *nite of original matter.*

WANTED to purchase twenty or thirty full blood Merino Ewes. Address, or apply to DANIEL WILD, Broker, Exchange Street, Boston. Feb. 7.

STANZAS.

BY BERNARD BARTON.

The flower's bloom is faded,
Its glossy leaf grown sere;
The landscape round is shaded
By winter's frown austere.

The dew, once sparkling lightly
On grass of freshest green,
In heavier drops unsightly,
On matted weeds is seen.

No songs of joy to gladden,
From leafy woods emerge;
But winds, in tones that sadden,
Breathe Nature's mournful dirge.

All sights and sounds appealing,
Through merely outward sense,
To joyful thought and feeling,
Seem now departed hence.

But not, with such, is banish'd
The bliss that life can lend;
Nor with such things hath vanish'd
Its truest, noblest end!

The toys that charm and leave us,
Are fancy's fleeting elves;
All that should glad or grieve us
Exists within ourselves!

Enjoyment's genuine essence
Is virtue's godlike dower:
Its most triumphant presence
Illumes the darkest hour.

MISCELLANY.

COMETS.

The following remarks are extracted from an English work. They refer to some observations which had been made by Dr. Herschel on the Comet of 1811. [*Providence Gazette.*]

The Comet of 1807, in its approach to the sun advanced within sixty one millions of miles of it, and its tail, when longest, covered an extent of nine millions of miles. The late Comet, in its perihelion did not pass so near the sun by about thirty six millions of miles, being about two thirds only of the closest approximation of the preceding, and nevertheless acquired a tail of upwards of a hundred of millions of miles. May we not then conclude, as he suggests, that the consolidation of the comet of 1807, when it reached its perihelion, had already been carried to a much greater degree of density than that of the last comet, by some former approach to our sun, or some similarly constructed celestial bodies, such as we have reason to believe the fixed stars to be? And that comets may pass round other suns than ours, is rendered probable from our not knowing, with certainty as yet, the return of more than one comet among the great number that have been observed?

Deguignes enumerates two or three hundred comets mentioned by Chinese writers. Doubts, however, have since been thrown upon the authorities referred to.

Extensive as are orbits of comets, from their eccentricity they have sometimes approached much nearer to the sun than any of the planets; for the comet of 1680 when at its perihelion, was at the distance of only one-sixth of the sun's

diameter from its surface. Yet from the very inconsiderable density of their enormous tails, and even of the greater part of the nucleus itself, should it ever happen to a planet, of which there is but very little probability, to fall exactly in the way of a comet, it is supposed that the inconvenience suffered by the inhabitants of the planet might be merely temporary and local: the chances are however, much greater, that a comet might interfere in such a manner with a planet, as to deflect it a little from its course, and retire again without coming actually into a contact with it.

Nearly 500 comets are recorded to have been seen at different times, and the orbits of about a hundred have been correctly ascertained: but we have no opportunity of observing a sufficient portion of the orbit of any comet, to determine with accuracy the whole of its form as an ellipsis, since the part which is within the limits of our observation does not sensibly differ from the parabola, which would be the result of an ellipsis prolonging without end.

Two comets at least, or perhaps, three, have been recognized in their return.—A comet appeared in 1770, which Prosperin suspected to move in an orbit materially different from a parabola. Mr. Lexell determined its period to be 5 years and 7 months, and its extreme distances to be between the orbits of Jupiter and of Mercury; but it does not appear that any subsequent observations have confirmed his theory.

CHRYSTALLIZATION OF WATER.

The crystallization of water under the form of those night frosts which so much prevail during the early spring, and which are of such important service in assisting the operations of agriculture, by rendering the surface of the earth mellow, and better susceptible of the manure that is necessary to it, are greatly assisted and in many cases entirely brought about by the intervention of moonlight. It is well known, that under certain circumstances, water will sink to the temperature of 22 degrees before it freezes, or takes the form of crystals. Indeed it will invariably do so in the absence of any mechanical agitation, and in the absence of light. It is an unquestionable fact, but one which has not been observed generally, or attended to, that during that period of the year which has been alluded to, and indeed other periods, before the moon rises on a still clear night, when the atmosphere is at a lower temperature than 32, the water remains in a liquid state, but immediately on the moon rising, and diffusing its light around, the water freezes, and performs the salutary offices required of it, without subjecting us to the severity of a low temperature.—*Gurney's Lectures on Chemistry.*

Suffocation of Infants.—Infant children are too frequently exposed to risks of suffocation, from the imprudent covering of their mouths by their nurses. The accession of air to their lungs is thus prevented, and death ensues; for every animal destroys the air it breathes, and an infant requires the circulation of at least a gallon of air a minute. Deprived of this circulation, the air in the lungs loses its elasticity, the action of those primary organs is stopped; and it is in vain that the little victim gasps unseen, till death puts an end to its suffering. At

a riper age, when the frame is endued with more strength, and a consciousness of the cause of suffering is entertained, the struggles of children to escape from suffocation by means of cloths thrown over their faces, may be commonly observed, and should be received as lessons.

It is but a little time since a poor woman was lying, in a storm of wind, between Hunsdon Ware, sheltered her infant so effectually by her cloak, that melancholy to tell, on her arrival at the end of her journey, the child, who she had fancied asleep was dead.—*Lon. paper.*

FOR THE NEW ENGLAND FARMER.

APHORISMS.

Riches.—A competency is truly desirable, and should diligently be sought for. But riches cause great care, and those who "careful about many things," may endure, cannot enjoy their existence.

Temperance in Labor and Study.—A man is too ardent even in laudable pursuits, who depriving himself of rest and refreshment, lays a foundation for years of languor and pain. The laborious student should recollect that natural excellence cannot exist after the constitution is destroyed by mental exertion.

The value of Praise.—Praise is to be estimated according to the source from which it originates. It may be flattery of fools, and the clamations of the vicious, and if so it is much to be deprecated as the censure of wise and virtuous.

Useful Learning.—Human intellect has bounds, and no one man can take an accurate survey of the whole field of science. A child then should be made of such objects of instruction as are most likely to fit the pupil for a part which he will probably be called to acquire. Agesilaus being asked what child should learn, replied, "What may be of use to them when grown up to be men."

ANECDOTE.

An unfortunate man, who had never drunk water enough to warrant the disease, was reduced to such a state by dropsy, that consultation of the physicians was held upon his case. They decided that tapping was indispensable, and the poor patient was induced to submit to the operation, notwithstanding the entreaties of his son, a boy of seven years old. "Oh, papa! do not let them tap you!" screamed the urchin in an agony of fear, "do any thing, do not let them tap you!" "Why my dear son, do not let the parent, it will do me good, and I shall live long in health to make you happy." "Father, no, you will not; there never was anything tapped in our house that lasted more than a week."

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLAR per annum, payable at the end of the year—but if who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS. No paper will be discontinued (unless at discretion of the publisher,) until arrearages are paid.

FOR THE NEW ENGLAND FARMER.

REMARKS ON SEVERAL SUBJECTS RELATING TO RURAL ECONOMY.

[Continued from page 213.]

ON THE USE OF LIME IN GARDENING.

7. Land which has been long cultivated, is generally, said not to be good for turnips, and the common way of culture is not. The turnips will, indeed grow, without lime, to considerable size, but they will be spongy and injured by worms. This I have found invariably the case in my garden, for six years past. I could raise them in fine crops, after their growths were removed, as I have mentioned in another communication, yet they were not good for the table. But with the use of lime, the last season, I succeeded in raising over the greater part of my garden in a very fine state, and in quantity sufficient, I should think, to pay for all the manure I have used during the year, with no other labor than sowing and hoeing them once.—And all after one or two crops had been procured. That it was lime that preserved them from the worms, and also from being spongy, is fully evident in this, that in some small parts of the garden I did not use lime, and in those parts the turnips were defective as usual.

Seeds. This is a subject of much greater importance than is usually supposed. I will advert to the age of seeds when they should be used. Do not mistake in supposing that it is generally sought the newer the seed the better? When the produce is looked for under ground this may be true. Also when it is to be in leaves and vines. But when in things produced upon vines, as peas, beans, cucumbers, &c. the seed should not ordinarily be used till it is two years old. If it were twice that age it would be the worse, except, in planting, a little more seed should be required. Trial and observation will afford proof of the justness of these remarks.

REMARKS BY THE EDITOR. We agree with our correspondent in opinion that the subject he has adverted to of great importance; and we think it has not received the attention from farmers and gardeners, which it merits. Dr. Darwin in his work entitled "*Phytologia*" says, "Gardeners in general prefer new seeds to old for their principal crops, as they are believed to grow up sooner, and with greater certainty, and to grow more luxuriantly." "But peas and beans of a year old," Mr. Marshall observes "are by some preferred to new as not so likely to run to straw. And cucumbers and melons are best to be several years old, in order to their shooting less vigorously, and thence coming more fruitful. But this principle is carried too far by some gardeners, who say these seeds cannot be too old, and will allow ten years to be within bounds: three for cucumbers, and four for melons, however, is age enough."

As to the age of seeds at which they may be sown, is uncertain, and depends much on how they are kept; those of cucumbers and melons are good a long time, because very carefully preserved.

Peas and beans will germinate very well at seven years of age; but the seeds of lettuces and kidney

beans, and some others, are not to be depended upon after a year or two; and, generally speaking, the smaller seeds are of the least duration."—*Marshall on Gardening.*

If it be true, (as our correspondent says it "may be") that new seeds are best "when the produce is looked for under ground," or "when it is to be in leaves and vines," the fact is of great importance.—Nor is the other assertion less worthy of notice that old seed is best "for things produced upon vines, &c." We hope that farmers and gardeners will turn their attention to this subject, and by accurate and repeated experiments ascertain at what age the most important seeds, which are used in farming and gardening should be sown in order to produce the most valuable crop.

9. **Glass Lamps.** The shape of these is of great importance inasmuch as beauty and utility happen here to coincide, which is not always the case. The lamp should be oblate, not globular or oblong as they are generally to be found. The opening at the top should be as small as convenience will allow. One pipe only for a wick, and a little higher than usual.—And if there is any duting, it should be confined to the under part of the lamp. And the lamps should never be very long. The part designed to be lighted should be trimmed in the shape of a cone, and all the excrescence above the tube carefully taken off every day. A lamp of this shape, and thus trimmed will give as much light as lamps of the more common shape, with one third less oil, and will have a much more bright and lively appearance. And the light, as it is produced in great measure by reflections, will be more uniform, and, so to speak, more mellow. This is no speculation, but the result of more than three year's experience, attended with the most careful observation, and with several lamps. I have one now in use of the right shape, which gives sufficient light for any common family purpose, reading or sewing, with a consumption of oil not greater, for the time, than is expended by a common taper, as has been shown by actual measurement. The truth of these observations will be readily perceived by those who have any considerable knowledge of the laws of light and shade. And those who have not will find the most satisfactory proof in the result, which will attend the trial.

In choosing a glass lamp have regard to the foregoing observations; but whatever shape you prefer, be sure to obtain those of small tops, and always with single pipes. If more lights than one are wanted it is better to use two lamps. A lamp of the shape recommended and prepared as above will, with one wick, give more light than those in the usual shape with two wicks.

RHODE-ISLAND SOCIETY

For the Encouragement of Domestic Industry.

At an adjourned quarterly meeting of the Standing Committee of said Society, holden at Pawtuxet, on the 3d inst. the Committee on Agricultural Products submitted the following report:

Dr. CHARLES ELBRIDGE, of East-Greenwich, is entitled to the Society's premium of ten dol-

lars, on a crop of Indian Corn, of one hundred and twelve bushels and two pecks, on one acre of ground. The soil of this acre is a gravelly loam; the year previous it was well manured, and two crops taken from it, one of hay, and the other of round turnips. Last Spring, twenty-seven loads of good compost manure were put on it, and the land was twice ploughed; on the 20th of May it was furrowed, north and south, three feet apart; the corn was planted twelve inches apart, in the furrow, from two to three grains in a hill; it had two ploughings, with a horse plough, and two hoeings. After the first hoeing, thirteen barrels of Menhaden fish were put on fourteen rows of corn, which made a great improvement in the growth. The expense of cultivation, placing half the value of the manure to the growing crop, is stated at twenty-five dollars and eighty cents.

Mr. NATHANIEL COOK, of Cumberland, is entitled to the Society's premium of eight dollars, on a crop of Indian Corn of one hundred and five bushels on one acre of ground. The soil on which this grew was naturally good, and has been watered about twenty years. It was planted with corn last year, and about forty loads of manure put on it. It was planted this season about the middle of May. The ground was ploughed twice, and then furrowed about seven feet apart. These furrows were filled with stable manure, and consumed about twenty-two loads. A furrow was turned from each side on to the manure. There were sown in these last furrows, about twenty-two loads of manure made of mud, which had been yarded upon about four months. The corn was planted in these last furrows, about eight or ten inches apart. It was ploughed twice and hoed three times. The seed was a large white corn, harvested about the middle of October, and the expense of the cultivation about thirty dollars.

THOMAS FRY, Esq. of East-Greenwich, is entitled to the Society's premium of twenty dollars, on a crop of Indian Corn, of three hundred and ninety-nine bushels and twenty-nine quarts, on four acres of ground; which is within a fraction of one hundred bushels to the acre.—This land is a strong loam, was mown the past year, and cut about a ton of hay to the acre.—It was ploughed about the middle of May—one hundred loads of compost manure were carted and spread on the ground after ploughing.—About half the ground was harrowed with an ox harrow, then furrowed with a plough about three feet apart, and two grains of corn dropped, once in from nine to twelve inches. It was planted on the two last days of May, and was hoed twice. At the first hoeing it was harrowed twice in a row, with a horse harrow, and, at the second hoeing, was ploughed twice in rows, deep enough to turn up the sward. The expense of cultivation, including half the value of the manure, was eighty-four dollars and seventeen cents. One acre of the above was measured separately, and produced 133 bushels.

Mr. STEPHEN GREEKE, Jun. of East-Greenwich, has raised this season on one acre of ground, five hundred and seventy bushels of carrots, twenty-six bushels of onions, from five to seven hundred lbs.

of winter squashes, fifty-one cabbages, a cart body of water melons, and a quantity of radishes.

This was not originally intended for a premium crop, and is not brought strictly within our regulations. As there is, however, no competition, as the quantity of carrots approaches nearly to our limit, and as the whole produce exceeds both in bulk and value what we require, the Committee recommend that the premium of fifteen dollars be awarded to Mr. Greene. The soil on which this crop grew is a gravelly loam, and was planted the past year with potatoes.—Twenty tons of slaughter-house manure were ploughed in. It was then bushed and ridged with a horse plough for planting. The rows were from eighteen inches to two feet apart.—The seed was sown in the row and thinned. It was hoed four times, and the expense of cultivation is estimated at thirty-seven dollars.

No claims have been offered for any premium on potatoes, mangel wurtzel, barley, a new species of grass or flax.

The general culture of the potatoe has afforded, at a cheap rate, an ample supply for the demand; still it would be creditable to this Society and to the State, that some experiment in the culture of this indispensable vegetable should be conducted in a manner to equal our success in Indian corn.

Captain JONATHAN ANDREWS, of East-Greenwich, has raised this year on one fourth of an acre of ground, two hundred bushels of mangel wurtzel.

It is regretted that proper measures were not taken to render this a premium crop. Nearly one thousand bushels of this valuable root have been raised to the acre in Massachusetts. The leaves, which may be plucked often, are refreshing and nourishing to hogs. The root itself affords a valuable succulent food for milch cows, at the season when our pastures usually fail, and must be valuable winter food for cattle. A chemical analysis exhibits a greater proportion of nutriment in the beet, of which the mangel wurtzel is a species, than in the carrot. Allowing the carrot to possess equal or greater value, the mangel wurtzel, where labor is scarce and dear, has evidently the advantage in field culture.

Barley has been for some years extensively attacked by a fly, and has become in many parts of the State, a hopeless crop.

Millet, which had not hitherto been much cultivated in this State, has attracted considerable attention, during the present year. It is stated that this article will produce, under favorable circumstances, three tons of good fodder to the acre, and a quantity of grain equal to an inferior crop of corn. The grain, except as a substitute for buck-wheat, is not used as food for man, but is said to be valuable for poultry and hogs. If further experiments should confirm the present favorable impressions, millet must become an useful accession to our crops. Having the quality of a hay crop, it saves one year in the conversion of arable to grass land. It is hoped that the successful experiments which have been exhibited to your committee, tho' not numerous, may be the means of bringing the strong motive of private interest to aid our scheme of general improvement. We may

reasonably expect, that every year will increase the mass of produce, which is thrown from the interior on the markets of the sea coast, and that every effort of ingenuity and industry must be employed, to enable us to sustain the competition. We must not only abandon the wasteful system of foddering out, and place in requisition all our resources for manure, but, by increasing the quantity of produce on a given portion of ground, we must effect the only favorable change, of which the rate of labor seems immediately susceptible.

To plant Indian Corn, extensively, with little or no manure, to hoe in a succeeding crop of rye, to leave the land with little or no seed, and then to expect a rapid restoration of fertility, is asking from nature what the God of nature seems to declare that man shall not possess, without exertion. The Being who created such variegated materials of fertility, without doubt intended them for judicious application. All the cultivated portion of the earth labors, and like an animal, needs food and rest. The effect of this food, and of the rest which is derived from a protecting foliage, is not limited to a single effort. It exists through a variety of operations, and resolves itself into an union of beauty and utility, which delights, equally, the eye and the mind.

SAMUEL KING, For the Committee.

Pastuxet, December 17, 1823.

[R. I. American.]

We have received, by the kindness of a friend, a pamphlet, containing an Address delivered by Rev. HENRY HENFREY, D. D., at his Inauguration to the Presidency of the Collegiate Institution, in Amherst, Mass. from which the following is extracted. We, with much pleasure have republished the whole Address which has much merit; but the greater part is foreign to the principal objects of our paper, and has, moreover, been extensively circulated not only in pamphlets, but in newspapers.

"In treating of education, we may advantageously divide the subject, into three great branches of physical, intellectual and moral improvement. Under these heads, we shall include all that is requisite to form a sound and healthy body, a vigorous and well stored mind, and a good heart. If the first of these, or what I choose to call the physical part of education, has not been wholly overlooked, (as it certainly has not,) in the most popular systems, still, it may well be questioned whether it has yet received that degree of attention, which its immense importance demands.

"Such, in our present condition, is the mysterious connexion between body and mind, that the one cannot act, except on a very limited scale, without the assistance of the other. The immortal agent must have an "earthly house" to dwell in; and it is essential to vigorous and healthful mental operations, that this house should be well built, and that it should be kept in good repair. Now, it is the province of physical education, to erect the building, and in carrying it up, to have special reference to its firmness and durability; so that the unseen tenant, who is sent down to occupy it, may enjoy every convenience, and be enabled to work to the very best advantage.

"That is undoubtedly the wisest and best regimen, which takes the infant from the cradle,

and conducts him along through childhood and youth, up to high maturity, in such a manner as to give strength to his arm, swiftness to his feet, solidity and amplitude to his muscles, symmetry to his frame and expansion to all his vital energies. It is obvious, that this branch of education, comprehends not only food and clothing; but air, exercise, lodging, early rising and whatever else is requisite to the full development of the physical constitution.

"If, then, you would see the son of your prayers and hopes, blooming with health, and rejoicing daily in the full and sparkling tide of youthful buoyancy: if you wish him to be strong and athletic and careless of fatigue; if you would fit him for hard labor and safe exposure to winter and summer; or if you would prepare him to sit down twelve hours in a day with Euclid, Euclid and Newton, and still preserve his health, you must lay the foundation accordingly. You must begin with him early, you must teach him self-denial, and gradually subject him to such hardships, as will help to consolidate his frame and give increasing energy to his physical powers. His diet must be simple; his apparel must not be too warm, nor his bed too soft. As good soil is commonly so much cheaper and better for children than medicine, beware of too much restriction in the management of your darling boy. Let him in choosing his play, follow the suggestions of nature.

"Be not discomfited at the sight of his sarbills in the road, his snow forts in February, at his mud-dams in April; nor when you chance to look out in the midst of an August shower and see him wading and sailing and sportive along with the water fowl. If you would make him hardy and fearless, let him go abroad; often as he pleases, in his early boyhood, amuse himself by the hour together, in smooting and twirling the hoary locks of winter. Instead of keeping him shut up all day with stone, and graduating his sleeping room in Fahrenheit, let him face the keen edge of the north wind, when the mercury is below cyphre and instead of minding a little shivering or complaining when he returns, cheer up his spirits and send him out again. In this way, you will teach him that he was not born to live in the nursery, nor to brood over the kitchen fire; but to range abroad as free as the snow and the air, and to gain warmth from exercise. I love and admire the youth, who turn not back from the howling wintry blast, no withers under the blaze of summer; who never magnifies "mole-hills into mountains," but whose daring eye, exulting, scales the eagle's airy crag, and who is ready to undertake an thing that is prudent and lawful, within the range of possibility.

"Who would think of planting the mountain oak in a green house, or of rearing the cedar of Lebanon in a lady's flower pot? Who does not know that in order to attain their might, strength and majestic forms, they must feel, enjoy the rain and the sunshine, and must feel the rocking of the tempest? Who would think of raising up a band of Indian warriors, upon cakes and jellies and beds of down, and amid the luxuries and ease of wealth and carefulness. The attempt would be highly preposterous, not to say utterly ridiculous. Very different is the course which nature points out. It is the plain and scanty fare of these sons of the forest, their

hard and cold lodging, their long marches and fastings, and their constant exposure to all the hardships of the wilderness, which give them such Herculean limbs and stature; such prodigious might in the deadly fray, and such swiftness of foot in pursuing the vanquished.

"I am far, however, from saying that such raining, would ensure to every child the arm of Achilles, or the courage of Logan, or the constitution and daring of Martin Luther—Some would doubtless sink under a vigorous early discipline; but not near so many, as is generally supposed. The truth is, there is a mistaken tenderness which daily interferes with the healthful economy of heaven. Too many parents, instead of building upon the foundation which God has laid, first subvert that foundation by misplaced indulgencies, and then vainly attempt to build around the ruins. They cross and perplex nature so much, in her efforts to make their children strong and healthy, that she at length refuses to do any thing, and the doctored parents are left to patch up the shattered and puny constitution as well as they can, with tonics and essences. In this way, not a few young men of good talents, are rendered physically incapable of pursuing their studies to any advantage. They can never bear the fatigue of close and long continued application. The mind would gladly work, but the earthly tabernacle is so extremely frail, that every vigorous effort shakes it to the foundation. It is like setting up the machinery of a race, in a mere shed, without studs or braces—or like attempting to raise the steam for large ship, in a tin boiler. Whatever talents youth may possess, he can accomplish but little in the way of study, without a good constitution to sustain his mental efforts; and such a constitution is not a blessing to be enjoyed of course. Like almost every other gift of heaven, it is to be obtained by human providence, and in the use of means adapted to the end. How many who begin well, ultimately fall of eminence and usefulness, through excessive tenderness, and for want of skill and care in their early physical education, it is impossible to say; but that many a young man is doomed to lingering imbecility, or to a premature grave by this kind of mismanagement; and at the subject on which I have hazarded the foregoing remarks, is intimately connected with the vital interests of the church and the state, I do not, I think be questioned.

"One thing more, I deem it important to say, before I dismiss the present topic. The finest constitution, the growth of many years, may be ruined in a few months. However good the health of a student may be when he enters college it requires much care and pains to preserve it; and there is a very common mistake as to the real cause why so many fail. Hardly has all the credit of undermining many a constitution, which would have sustained twice as much application and without injury too, by rily rising and walking, and by keeping up a lively acquaintance with the saw and the axe—worthless in themselves, then, as are the elements which compose this mortal frame, so essential are its healthful energies to the operations of mind, that so long as the body and soul remain united, too much care can hardly be bestowed upon the former for the sake of the latter."

Interesting Calculation.—Supposing the earth to be peopled with one thousand millions of inhabitants, and allowing 33 years for a generation, the deaths of each age amount to 30,000,000; of each day to 82,000, and of each hour to 3446. But as the number of deaths to the number of births is as 10 to 12, there are born yearly 36,000,000; daily, 93,630; and hourly, 4109. Reckoning only three generations to a century, and supposing the world has existed 5720 years, there have been only 172 generations from the creation—125 since the Deluge, and 55 since the Christian era. Out of every 1000 there die annually 30; and the number of inhabitants of every city and country is renewed every thirty years. Of 200 children, one dies in the birth; but more than one third of the births die within two years of age. The births are more numerous than the deaths, in any given place; and the proportion of the births of male and female are not in wide proportion, not an uncertain accidental number, but nearly equal. Major Grant's table formed about 150 years ago, stated, for the bills of mortality, 15 males to 12 females; whence he justly inferred, that the Christian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahomedanism, and all other persuasions that allow it. The majority of males is a wise dispensation to provide for their dangers and losses by wars, sea voyages, excess of labor, &c.

From the American Farmer.
REMARKABLE MANGEL WURTZEL.

Nantoway Court House, Jan. 12, 1824.

DEAR SIR,—At a stated fall meeting of the Agricultural Society of Nantoway County, Virginia, Dr. Archibald A. Campbell, exhibited twelve mangel wurtzels, grown in his garden; the size of them were so far beyond any thing of the kind I have ever seen before, I was induced to weigh them; they weighed 152 lbs. averaging 16 3-4 each the largest of them weighed 16 2-3; one of them measured 30 inches in length; they are of the mottled kind, and grow more out of the ground than any I have ever seen: from the well known properties of the mangel wurtzel, I am induced to believe they are far preferable to the common turnip or the rutabaga, whether as a food for cows or hogs they are eaten with avidity by both.

I am, sir, with respect, yours, &c.

N. WARD.

Onions.—This vegetable is supposed to have been originally brought from Egypt, where they must have possessed a most bewitching taste, since the Israelites would fain have returned to bondage, for the sake of enjoying them again. Alexander the Great sent them to Greece, and from thence they became common on the whole continent. It is remarkable that the particles emanating from this bulbous root are so volatile and so keen, that they instantly corrode the external surface of the eyes, and draw tears; and it is more curious still, that if, when peeling an onion, the cook wishes to be spared this lachrymatory affection, a small piece of bread placed at the end of the operating knife, will absorb the effluvia and prevent the disagreeable effect.

Mustard.—Why buy this when you can grow it in your garden? The stuff you buy is half drugs and injurious to health. A yard square of ground,

sown with common Mustard, the crop of which you would grind for use, in a little mustard-mill, as you wanted it, would save you some money, and probably save your life. Your mustard would look *brown* instead of *yellow*; but the former color is as good as the latter; and, as to the taste, the real mustard has certainly a much better than that of the drugs and flour, which go under the name of mustard. Let any one try it, and I am sure he will never use the drugs again. The drugs, if you take them freely, leave a burning at the pit of your stomach, which the real mustard does not.—Cobbett.

HISTORICAL.

The British General, Prescott, who was captured at his quarters on Rhode Island by Col. Barton, being on his route through the State of Connecticut, called at a tavern to dine, the landlady furnished the table with a dish of such-stash, boiled corn and beans. The General being unaccustomed to such kind of food, with much warmth exclaimed, "What do you treat us with the food of hogs?" and taking the dish from the table, strewn the contents over the floor. The landord being informed of this, soon entered, and with his horse whip gave the General a severe chastisement. The sequel of this story has recently been communicated by a gentleman at Nantucket, who retains a perfect recollection of all the circumstances. After Gen. Prescott was exchanged and restored to his command on the Island, the inhabitants of Nantucket deputed Wm. Rotch, Dr. Tupper, and Timothy Folger to negotiate some concerns with him in behalf of the town. They were for some time refused admittance to his presence, but the Dr. and Folger overcome the opposition and ushered themselves into the room. Prescott raged and stormed with great vehemence, until Folger was compelled to withdraw. After the Dr. announced his business, and the General had become a little calm, he said, "Was not my treatment to Folger very uncivil?" The Dr. said yes. Then said Prescott, "I will tell you the reason. He looked so much like a damned Connecticut man, that horse whipped me that I could not endure his presence."

RECIPES.

Mr. Cooper, in his Dictionary of Surgery, gives the following recipe as infallible for the cure of corns.—Take two ounces of gum ammoniac, two ounces of yellow wax, six drachms of verdigris, melt them together, and spread the composition on a piece of soft leather or linen; cut away as much of the corn as you can with a knife, before you apply the plaster, which must be renewed in a fortnight, if the corn is not by that time gone.—*Am. Farmer.*

Cosmetics.—Of cosmetics, the only good one is fine soap, plenty of cold water, moderate food, and moderate passions.

Longevity of the Horse.—The Pittsburgh Mercury states, that there is now employed, at the Point Brewery, in that city, a horse whose age is at least 31 years. For the last fourteen years he has been in the possession of his present owner; and he is now as active and sprightly as most horses of seven years old. He has hauled, within the last fourteen years, upwards of 39,000 barrels of beer and porter. These facts are at least curious, and go to show, that, with proper attention and care, that noble and valuable animal, the Horse, will be serviceable much longer than is generally supposed.—*Phila. paper.*

From the Massachusetts Agricultural Repository for
January 1821.

CASHMERE GOATS.

TO THE PRESIDENT OF THE AGRICULTURAL SOCIETY.

A memoir of Messrs. Ternaux and Jaubert, read before the Royal Academy of Sciences at Paris having been sent me, I deemed the subject of which it treated would be interesting to the public, and handed an extract therefrom, with some introductory observations, to the editor of the New England Farmer, which was published January 11th last, in that useful paper.

This subject, so interesting to naturalists, and destined to become important in the progress of our manufactures, arrested the attention of the Trustees of the Agricultural Society of Massachusetts. At their last publication of premiums, they offered "the sum of one hundred dollars to the person who should import into this State, from Europe, a male and female goat of the pure Cashmere breed."

They further requested the subscriber to procure, through his friends in France, such an account of this animal as to thrift, mode of treatment, productiveness, &c. as might enable them to form the most correct judgment how far the climate might suit, and general circumstances make its introduction here expedient.

The desired information has been obtained by my friends from Messrs. Ternaux themselves, who state that the animal is naturalized in France and promises the most satisfactory increase, as well as benefit to manufactures.

To this account, it will appear, a practical mode of treatment with a flock is added as observed in France. The manner of feeding of animals, and division of pasture will vary according to the climate, condition or culture, &c. &c. But experience must be considered as a guide of some utility, especially in the introduction of a new and valuable race.

The prices, it will be perceived, vary from fifteen dollars, to seventy-five dollars, a head. The duty on export is very trifling, say about four cents each.

The patronage which has been exercised in the encouragement given to these meritorious individuals, Messrs. Ternaux and Jaubert, is as honorable to the government of France, as the enterprize and success of the expedition is to these gentlemen. The diffusion of the knowledge acquired and of the benefit of the discovery, of which, it will be seen, all may avail, is of a like honorable character. The liberal communication of information by Messrs. Ternaux, and the offer of facility in the export to this country, will probably be used by the Society in the course of the next season, at its own charge and risk with a view to that future improvement of our manufactures to which the Massachusetts Agricultural Society always wish to look with a steady attention.

A few remarks only, that these papers may be well understood, will follow.

Until the issue of this expedition it was unknown what animal gave the material of the Cashmere (or by some called Camel's Hair) Shawl. Of these we see the cheaper kinds, but the most valuable are of incredible cost.—This question is now satisfactorily settled by these inquisitive travellers.

The route taken was first to Odessa, which is

in Russia, on the coast of the Black Sea, Lon. 30, 45 East, Latitude 46, 30 North, a place containing 40,000 inhabitants; next to Tunga-rock or Tanganrok near the Sea of Azof.—Then to Astrachan in Asia on the Caspian Sea, Lon. 47, 41 East, Lat. 46, 18 North. This place is the See of a Bishop, and contains within its walls and environs a population of 70,000. Then passing to the foot of Mount Caucasus, between Astrachan and Orenburg, a wandering tribe were found, who possessed the animals sought after.

To illustrate the good fortune of these travellers, it need only be stated that, if they could, from 1229 goats, reach France with only about 400, their disappointment must have been inevitable had they have proceeded from the Caspian Sea, to Thibet on the borders of India.—The journey must have been insupportable, and to no good effect.

I am, Sir, very respectfully yours,

JOHN WELLES.

Paris, April 8th, 1823.

JOHN WELLES, Esq.

Dear Sir,—I had the pleasure to receive your letters requesting me to obtain for you the best possible information respecting the Thibet Goat lately introduced into France.

I have made the necessary application to Messrs. Ternaux who have very politely and readily transmitted me to their opinion upon the importation and naturalization in France, by Messrs. Ternaux and Jaubert of the Thibetian Race.

The animals which were imported as well as those bred here continue, say they, to prosper in the most satisfactory manner, particularly those which inhabit a high and rocky country. In general humidity and rich pasturage are pernicious to them.

To this information Messrs. Ternaux add, that the goats have been sold from eighty francs, (fifteen dollars,) to four hundred francs, (seventy-five dollars,) per head, according to the beauty of the animal, and pay a duty of only three cents per head, upon exportation.

To enter into as many details as possible as to the modes of treating these goats, I will relate to you the manner, a friend of mine who bought ten of Mr. Ternaux two years ago, treated his. Some of these goats were those imported, and others were those bred in France.

He had constructed a fold fifteen feet in length to ten feet in width, with racks all round a bed of straw which is renewed every ten or fifteen days. The fold should be as little confined as possible in order that the air may circulate freely. It suffices that it should be covered with a simple roof, and at a small height, the other parts in lattice work or open. A trough for water. They give them early in the morning a bundle of hay, say twelve pounds, and the rest in vegetables and herbs from the kitchen garden. As soon as the dew is passed or the grass dry after rain, they let them out into the field, in a square surrounded with a barrier or portable fence, each barrier from four feet in width to six feet in length, twelve in all, which makes a square of sixty feet. This extent of ground is sufficient for one day's food and sometimes two according as the grass is more or less grown. By the means of these barriers you go over the whole extent of ground and the goats

have always fresh pasturage. When they lay in this manner gone over the field, you beg again at the first place, avoiding only to return too soon before the grass may have well grown otherwise they will not eat. At the setting of the sun they are taken back to the fold and you give them another bundle of after grass or second crop hay. This last ration is only necessary in winter, when there is not much in the field or greas from the garden. They give them also every evening a peck of oats or bran mixed together, and once a week you add two handfuls of coarse salt. If you perceive the goats are too heated you give them bran without oats, if the reverse you give them bran and salt without bran. These animals are very docile and easily led. It is generally in the month of February and March that the mother has her young after having carried it six months. At the birth of the young goat, you give to the mother a little more oats and bran. It is in the month of April you gather the down otherwise called Cashmere wool, you take it off in combing the outside hair, you must when you perceive when the down begins to fall in the fold or on the grass, comb them a little every day with a comb that hath the teeth very close set. From five goats my friend gathered nearly two pounds of down last year, they are subject to the same diseases as sheep. Wet and damp ground does not suit them. These diseases manifest themselves by humors and eruption of the skin and great increase of the swelling of the hoofs. These animals eat of every sort of vegetable, they are fond of the twigs of tree only it is necessary to prevent their eating pine or fir trees or any evergreen (that is I say, any trees that remain green the year round these trees are a sort of poison to them).

The down has been made use of in some of our manufactures to a very striking improvement. It will need however some time and experience to realize all the advantages which have been anticipated. If I can hereafter, in this, or any other subject connected with the laudable purposes of the society with which you are connected, render any services you will freely command.

As the writer is not an agriculturist I do not feel at liberty to use my friend's name.

From the Old Colony Memorial.

AGRICULTURAL STATEMENT.

To the Trustees of the Plymouth County Agricultural Society.

[Continued from page 218.]

Having subdued the soil in a measure, having as my laborer said, broken the heart of it, I proceeded to plant it with potatoes and Indian corn. In those parts, where the soil was not deep, and where from springs it was wet, I planted potatoes, making use of sheep-manure, which had been mixed with straw. In those places, where there was a deeper soil, where formerly there was a bog, or shaking ground, but which from draining and ridge-ploughing had now become much drier, than those parts, where there was less depth of soil, I planted Indian corn, manuring each hill with a shovel full of compost manure. One kind of compost, used, was formed of sand and the drippings of a sink, soap suds, &c. The other compost, used,

sand intimately mixed with a small proportion of night-soil.

As from the nearness of ditches to each other, the muriness of soil at the margin of ditches, could not calculate on using the horse-plough; planted the corn nearer, than I should otherwise have done, viz. three feet apart, putting six kernels of corn in a hill. With water at greater depth, than about two feet beneath the corn, and with a shower upon it every few days, it came out of the ground as well, as could have been expected; there being not any hills missing, than there frequently are in low corn land. It was weedy, and had as many hoeings, as the multiplicity of my farming business would allow of; though not so many, as I ought to have had.

Where there was little depth of soil, the corn was not so good, owing to the roots being near the water, which was continually draining along through that portion of soil, which immediately above the pan. As the soil opened, the corn appeared better, and in the end, where the bog had been, the place where assistance of neighbors had been necessary to get cattle out of the mire, there the corn rose up luxuriantly; and a person in leaping the bushes gave to the dry soil, which floated on mud beneath, a waving motion, which was communicated to the standing corn, and was perceptible to some distance.

The crop of potatoes on the swamp, considered it was the first year of its being broken up, was also a wet season for such a soil, was abundant. So shapely and so large were they, some of them weighing from one to two pounds or more, that it became a query in my mind, whether I had not better devote some part of the ground to the culture of potatoes, rather than any other spot on the farm. A desire to get it covered with grass, was the only thing which prevented.

Indian corn, as has been said, was small in the places, where the soil was shallow, and where springs were numerous; but where the soil was deeper and consequently drier, considering the wetness of the season, and the small quantity of compost manure used, viz. one shovel in a hill, the crop was truly good. For the consideration of such persons, as may be possessed of boggy or shaking grounds I offer the following calculation. On a piece of ground 18 square, formerly as much a bog as any part of the swamp, containing 36 hills of Indian corn, the hills being 3 feet apart, there was a produce of 2 pecks, 6 quarts 1 pint and a half, which corn during the winter lay in a place by itself, that it might shrink, and was measured the spring following. If therefore a piece of ground 18 feet square, containing 324 square feet, produce the quantity of Indian corn before mentioned, what quantity will an acre, or 43560 square feet produce?—Answer, 25 bushels 2 pecks, 1 quart. Thus it appears that a parcel of ground, which had formerly been a pit for water, and a nuisance on the place, has by draining been brought to a degree of fertility, which surpasses that of any other spot on the farm, and has done this in a season unfavorably wet, and as done it with merely the ploughings and hoeings of one year,—and has done it with less than a quarter of the manure, which I usually lay out upon the richest of my corn-lands. In the autumn of this year I ridge-ploughed

those parts of the swamp, which appeared to be yet too moist and springy, and cleared out the drains, that the soil might be dry early in the spring.

In 1822, I again ridge-ploughed the swamp, and harrowed it, as soon as it was sufficiently dry, and sowed it with oats, harrowing them in, and then sowed it with hayseed, bushing it in, except a small patch of ground, which for want of oats I sowed with barley and hayseed. The kinds of hayseed I made use of, were herdsgrass, clover, and finetop, of each such a quantity, as is usually sowed, where one kind only is used; in order that if either of the kinds succeeded, the ground might be well set with grass. Of the goodness of the herdsgrass and clover seed I made myself sure by early in the spring sowing a small quantity of each in pots of garden mould, which I frequently moistened with a little water, and set in a warm place till they sprouted. The oats with the hayseed came up well, and the oats were remarkably luxuriant.—I now became doubtful, whether some other grain, as barley, or wheat, less disposed to be stout in the straw, might not have done better; for before the oats blossomed, or even began to send out branches at top, a part of them lodged, which obliged me to mow them, green as they were. The remainder of the oats, which maintained their erect position, were stout in straw, and to appearance very well filled; yet from the severe drowth, which succeeded the wetness of the spring, or from some cause unknown they were rather light. I therefore had them threshed but slightly, and mowed away. After settling till spring in a mow 30 feet in length, 10 feet in breadth, the height was about 11 feet 2 inches, or there were of the oat fodder 3342 cubic feet, equal to a solid cubic mow, the side of which is 15 feet very nearly. In this mow was not included about a ton, probably more, of the oats which had lodged, and which from having been cut early, and from having been well made during the drowth, were a most excellent fodder, which cattle ate in preference to English hay.

On the patch of ground sowed with barley, the straw was of a middling size, and the grain well filled and heavy. On this ground and on the oat ground after the removal of crops, the appearance of grass was much the same.

In the autumn of 1822 while a blood red sun and a burning atmosphere were parching our pastures, and our cattle famishing, the greenness of the swamp formed a striking contrast. The grass rose finely, and might have been mowed; but my cattle cast over the ground a wishful eye, and as from the severity of the drowth the soil seemed sufficiently hardened to bear their tread, I resolved, that they should be my mowers. [To be concluded in our next].

USES OF THE NETTLE.

"The common Nettle, though generally considered as a noxious weed, is of extensive utility: its young tops may be boiled during the spring, and eaten as a substitute for greens; it being not only nourishing, but mildly aperient. In the Western Islands of Scotland, a rennet is prepared, by adding a quart of salt to three pints of a strong decoction of nettles; a table spoonful of which is said to be sufficient to coagulate a bowl of milk. The leaves are employed for feeding poultry; and especially in

the winter, when boiled they promote the hatching of eggs—in a fresh state they are refused by horses, sheep, goats, cows and hogs; though asses devour them eagerly. When dry they are eaten by cows, for which they are an excellent food, increasing the quantity and improving the quality of their milk. According to M. Van Geuns, such fodder is an effectual preservative against the contagious distemper affecting horned cattle.

"The roots of the common Nettle, when boiled, communicate a yellow tinge to yarn.—But the most valuable part, is its fibrous stalk or stem; which on being dressed in a manner similar to flax or hemp, has, in some parts of Europe, been advantageously manufactured into cloth. This useful branch of industry has also been attempted in Britain, and a coarse durable canvass was produced, which is considerably harder than the cloth manufactured from hemp or flax. As however, this plant requires a rich soil, to obtain it in any quantities, and, as a much greater degree of attention and accuracy is necessary in the operation of retting than is requisite either for flax or hemp, Dr. Anderson is of opinion that the cultivation of hemp will be attended with difficulty. From the rind as well as the woody substance of the stalk, Dr. Schaeffer has produced a very good white writing paper; though that manufactured in France by M. De Villette, was of a dark green color.—The seeds on expression afford an useful lamp oil.

"In a medical view the whole plants, and particularly the root, is esteemed to be *diuretic*; and has therefore been recommended for the jaundice and nephritic complaints [such as gravel or stone.] A leaf, if placed on the tongue, and pressed against the roof of the mouth, is said to be efficacious in bleeding at the nose; and instances have occurred, in which paralytic limbs have been recovered by stinging them with nettles. If credit be due to some authors the expressed juice of this plant is a valuable remedy to the asthmatic and consumptive complaints.

Some interesting experiments have been made by Mr. Lannatine, in Italy; from which it appears that the flowers and seeds of the common nettle may, with efficacy, be substituted for the Peruvian bark, in all febrile affections, especially in the Tertian and quartan agues. This native vegetable operates more speedily than the foreign bark; and in large doses, induces a lethargic sleep: the portion to be given ought never to exceed one drachm, and it should be administered in wine, two or three times in the course of twenty four hours. The same cautions that are necessary in the use of Peruvian bark are likewise to be observed in taking the seeds and flowers of the nettle. Lastly, Mr. Zannettine recommends a slight infusion of the latter, in wine, as an excellent preservative for those who reside in marshy and unwholesome situations."—*Domestic Encyclopedia*.

Best preparation of Black Lead for cleaning Stoves, &c.—Mix powder of black lead with a little common gin, or the dregs of red Port wine, and lay it on the stove with a piece of linen rag; then with a clean, dry and close, but not too hard brush, dipped in dried black lead powder, rub it till of a beautiful brightness. This will

be found to produce a much finer and richer black varnish on the cast iron than either boiling the black lead with small beer and soap, or mixing it with white of egg, &c. which are the methods commonly practised.—*Dr. Cooper's Ed. of Domestic Encyclopedia.*

NEW ENGLAND FARMER.

SATURDAY, FEBRUARY 13, 1824.

[Continued from page 223.]

PARING AND BURNING. The instruments used for paring and burning in Great Britain as described in the Code of Agriculture, are 1. The Fen Plough. This machine, instead of a coulter has what is called a *Scalpe*, or circular plate of iron, turning constantly round, the edges of which are steeled, and kept sharp for cutting the turf. 2. The Breast Plough or Paring Shovel, which is calculated to be worked by men. The upper part is made of wood, with a share of iron with which the sod is cut. This instrument is pushed on by means of a hilt at the top. The labor is excessive, but a good hand will pare about an acre in four days. 3. The Copping Hoe. This is a French tool for cutting and raising up pieces of turf, growing on coarse and rough lands, which cannot be pared by the common breast plough. 4. The Frog-spade. This is in the shape of the common spade, but with three or four prongs instead of a plate. It is used for digging the turf on the side of waste-banks, &c. where the soil is too full of flints or stones, to admit readily the common or plate-spade. It enters the ground with much less labor than the common spade, and raises the turf equally well.

"The common plough is also frequently made use of, and in many situations is the best instrument for the purpose; particularly when instead of the usual share, it is equipped with a paring spade. By using it, the business proceeds with the greater despatch, and is attended with less expense in the previous cuttings, tho' by this mode it costs more for burning; but then a greater quantity of the soil is pulverized, and prepared for the ensuing crops, than when the breast plough is employed.

"When the plough is used and the soil is a peat moss, the horses must often be accommodated with patens; a particular description of which, with engravings, is given in Communications to the Board of Agriculture. In the fen districts, particular attention is paid to breed horses with broad hoofs, that they may be enabled to tread the soft soil with more safety."

"**The Depth.**—The usual depths are, from about one to six inches. In shallow soils the turf cannot be too thin. In Devonshire indeed, they endeavor, by cutting them in small pieces, and driving them about by harrows, to shake off the earth, and to leave nothing but the grasses and their roots to burn. Two inches are generally thought sufficient; but the late Mr. Wilkes, of Measham, in Derbyshire, frequently ploughed old, rough pastures, eight or nine inches deep, and burnt the whole furrow; and with the ashes, he not only manured the land pared, but as much more.—This, however, was rather burning the soil, than paring and burning the surface.

"**Modes of Burning the Sods.**—When the sod or turf is pared by any of these means, it is dried preparatory to burning. This is commonly done by letting the sods lie as the paring instrument left them, several days, thus drying their earthy side; then turning the grassy side upwards for two or three days; and if more drying should be necessary, they are placed on their edges, two sods supporting each other a day or two, by which both sides may dry at the same time. The burning process may be facilitated, in moist seasons and climates, by the use of portable furnaces, made of old iron hoops of the following figure and dimensions.

"In general, however, the sod or turf is burnt, either in small heaps,—large ones,—or spread on the surface.

"It is most convenient for the workmen, to collect the sods in small heaps on a field, ten or twelve feet apart, and to fire the heaps by a few red hot ashes, taken from the heaps that have been previously fired.

"Mr. Boys strongly recommends large heaps, each containing twenty cart loads, as more advantageous than small ones. There would thus be more inside, if properly attended to, converted by the smothering process, into a carbonaceous substance, by which the ashes would acquire more fertilizing properties.

"In one instance, instead of the sward being collected into heaps, it was all burnt over the surface, in the state in which it was left by the paring spade, and charred, instead of being reduced to ashes. This plan was attended with the best effects; for though the former produce was merely heat and ling, yet it produced spontaneously, a most luxuriant crop of grass, which continued permanent. There is something resulting from heat, applied to the surface of the soil, the advantages of which are not yet sufficiently understood." [To be Continued.]

The following handsome notice of Mr. BATES' Address is taken from the last No. of the American Farmer. We are happy to perceive that the merits of that valuable performance are duly appreciated by the Editor of a Journal so widely circulated and so ably conducted. We hope Mr. SENOWICK'S Address will meet with similar attention from the same quarter, and should be very much gratified with the assurance that both these productions were in the possession of every Agriculturist in the United States, and were to be diligently perused till their sound and valuable maxims were indelibly imprinted on the memory of every citizen capable of deriving benefit from such estimable sources.

"We shall be blamed, at the first glance of it, for publishing an article in one paper, so long as Mr. Bates' address. All we have to ask in extenuation or justification is, that we be not condemned, until the address is read. The views of political economy it exhibits are profound, and yet clearly and simply expressed, a great excellence in writing on that subject—but they are not so clearly conveyed as not to require it to be read with attention. The subject does not admit of that—studies of this nature are as necessary to young Farmers, who would understand their interests and their rights, as experience is to a practical workman. We would recommend that such papers be read at the family fire side—and aloud by the farmer's son. Thus will amusement be mixed with utility, and the ideas and truths they convey will in this way be imparted at the same time to several minds instead of one. As to the application of Mr. Bates' premises, that is another matter—about which our readers can form their own judgment. The reasoning may be clear and good, which leads us to perceive and understand important truths in political economy; and yet these truths may be used in attempting to establish ulterior positions and hypotheses, which are not tenable. The benefit which agriculture is to receive from an increase of duties on imported articles consumed by the farmer, and paid for with his products, will be better understood when we come to publish some additional papers on the score of its expediency—in the mean time, those who would deny or affirm the constitutional power of Congress to enact such an increase, with an exclusive view to the encouragement of particular branches of domestic industry, are respectfully referred to the able essay under the signature of RURIUS CONSULTUS, in number 42 of this volume."

FOREIGN.

A London article of Dec. 15, states, in substance, that the Russian and Dutch Government intend, early in the spring to unite their efforts to put the Spanish Monarch in possession of Spanish South America.

Pirates.—The last news from Porto Rico is that the Pirates were renewing their depredations and had boarded two American vessels, which were not afterwards heard of.

Havana.—A considerable portion of that city & the island of Cuba are not satisfied with the present order of things, and seem determined not to submit to present government of Spain.

The Marquis of Casa Irujo, formerly Ambassador to the United States, is appointed by Ferdinand the sixth Prime Minister of Spain.

The loans raised by the former Cortes of Spain swept away, and declared void by the present government.

DOMESTIC.

Mr. Webster.—Mr. Webster, the distinguished representative of Boston, in the National Congress, is personally known to the people of Charleston, who therefore feel some interest in the following sketch of his character and history.

He is a native of New Hampshire, and was educated at Dartmouth College in that state. After a few practices at the bar he was elected a member of Congress, at a period when our difficulties with foreign nations, and our internal dissensions rendered our national legislature the theatre of the most important most impassioned discussion. At that time Mr. Webster obtained and still enjoys the esteem and respect of the most virtuous and enlightened men with whom he was associated.

The concerns of his family requiring his attention, he declined a re-election to Congress and, subsequently, only a few years since removed to Boston.

The enlightened people of that place—who for had enjoyed intercourse with the profound learned Parsons—the dignified eloquence of Dexter—unequalled fascinations of Otis, looked eagerly for who should remind them of these. And the grand of the Boston Bar, actuated by the most kind brotherly feelings, welcomed Mr. Webster as an associate, with the most perfect consciousness that he to surpass them in the race. There is no envy in minds—and nothing selfish in the votaries of truth. The town of Boston has always been all ready to elect—but at the last election, at a public meeting a small hall to select a candidate in the room of Gorham, who declined re-election, that gentleman dressed the meeting, and doing great injustice to self, spoke lightly of his own ability, and recommended Mr. Webster to supply his place—because well known reputation for talents and virtue, and particularly because the late Mr. Lowndes, ever numbered with love and with sorrow, had spoken of him—We in the South have not his superior in the North have not his equal. Beautiful moral of kindred genius!

The people of Boston felt this appeal and acknowledged it, and Mr. Webster was elected by an immense majority over a highly respectable opponent.

His career at Washington will illustrate itself. In private life, he is beloved for extreme disinterestedness, for a love of mankind, and a careless wealth, because wealth cannot and ought not to be the slightest aspiration of the lofty mind.

He is a man of dark countenance and, seemingly stern features, artless in manners, generous in disposition, and holding his great talents only as trusts of truth, and learning, and liberty, and happiness.

[Charleston Courier]

The annual Report of the Secretary of the Treasury was transmitted to Congress, on the 2d inst. The tellerage furnishes the following summary of its contents.

The precise amount of the actual Receipts into Treasury during the three first quarters of the department (1823) are ascertained to be \$16,174,000, and receipts for the fourth quarter of the same year is estimated at \$4,570,400, making a total revenue for year, of \$20,744,025; and with the balance which in the Treasury on the first day of that year, making total amount of \$24,681,462. The Expenditures during the three first quarters of the same year were \$16,422,647, and the Expenditures for the fourth quarter of the same year are estimated at \$3,594,569, making a total expenditure during the last year of \$20,017,407, and leaving a balance in the Treasury on the day of the present month estimated at \$9,364,955.

ominations.—The Hon. SAMUEL LATHROP, of Springfield, has been nominated by the Federal Board of the Legislature, for Governor, and the Hon. RICHARD SULLIVAN, of Brookline, for Lieutenant of this Commonwealth. The Hon. HARRIS G. ORIS declined being considered as a candidate for office of Governor.

The Hon. LEVI LINCOLN, Lt. Governor, has been nominated to fill the seat now vacant in the bench of the Supreme Court of Massachusetts. This appointment will be highly satisfactory to all parties.

case of Small Pox has made its appearance in Boston Pleasant Street, in the south part of the city. The patient is a Mr. Ambrose Jones, recently from Maryland, but then residing in Pleasant Street. He was seized on the morning of the 10th inst., together with another, who had been in attendance, to the Hospital Rainford Island, the bed and clothing destroyed, house purified, and those liable in the vicinity vaccinated. The precautions were adopted by the Board of Health. Mr. Jones is supposed to have taken the infection from some articles belonging to his brother, lately died of the Small Pox in a neighboring town. In any other case occur, the same precautions will be adopted, and the public immediately notified.

Weather.—The mercury of two Thermometers is now stood at 16 deg. below 0, on Monday the 21st at 7 o'clock in the morning. On Thursday, at the same hour, it again stood at 16 deg. below zero; on Friday, at 10 o'clock, A. M., was at 10 deg. below, and at rise to but three above, during the day. On Friday, the 6th, at half past six in the morning, the mercury descended to 19 deg. below 0, and at half past the afternoon, had risen to 29 above, making a range of temperature of 48 degrees in seven hours.

[Y. H. Patriot.]

CONGRESSIONAL.

SENATE.—Friday, Jan. 30. A resolution was introduced, proposing an Amendment of the Constitution so to provide "That no person having been twice elected to the office of President, shall again be eligible to office." Yeas 36, Nays 3.

The Senate, in Committee of the whole, took up the resolution introduced by Mr. Benton, proposing an Amendment of the Constitution so as to provide for the election of the United States into Electoral Districts, each district having a vote for President and Vice President, and that vote to be decided by the ballots of the people in Primary Assemblies; and in case of no choice made by the people, to be decided by the House of Representatives as at present.

Mr. Benton supported his resolution by an able speech, and before he had finished the Committee rose, and the Senate adjourned.

Monday, Feb. 2. Mr. Lloyd, of Mass. presented a resolution directing the Naval Committee to report on the present state of the Navy Hospital Fund, &c. &c. This was agreed to the next day. Also a report on the Privateer Pension Fund, which was ordered to be printed.

Bill to secure public moneys in the hands of Clerks of Courts, Attorneys, Marshalls, &c. was introduced by Mr. Holmes, of Me. and read a first time.

Mr. Benton continued his remarks on the subject of Amendment of the Constitution, as stated above, but did not finish them before the Senate adjourned.

Naval Peace Establishment.—Mr. Lloyd, of the Committee, laid on the table a Communication, from the Naval Department, relative to the Naval Peace Establishment, which was ordered printed. Some other important bills were introduced on this and the succeeding day, but as they were not acted on we shall omit any notice of them till we have passed some stages, or are rejected.

Mr. Webster, from the Committee on the Navy, reported, that it is not expedient to repeal the act to establish the Judicial Courts, and respects writs of error.

Bill making appropriations for fortifications for the year 1850, was reported and read twice.

Tracy presented a resolution that the Treasury be directed to inform the House what purchases of real estate, by description, by virtue of sales on execution, have been made in behalf of the United States; also,

what estate has been acquired, in any manner, by arrangements with, or assignments from debtors of the United States; what sums have been paid or allowed on account of such purchases and acquisitions, severally; what charges have accrued, and what income has been derived therefrom—who are the several agents, who now have, or who heretofore have had the care of said estate, and what compensation has been allowed to them, respectively, for those services.

The House in Committee took up the bill to provide surveys for roads and canals. Mr. Randolph delivered a speech against the bill and Mr. Clay in favor of it.

The resolution from the Senate, proposing an Amendment of the Constitution on the subject of electing the same person more than twice to the office of President of the United States was read and committed.

Monday, Feb. 2. The House went into Committee on a bill for the appointment of two Indian Agents to be stationed at the western side of the Mississippi, with a salary of \$1300 per annum, which after a long debate was ordered to lie on the table.

A Digest shewing such changes of the Commercial Regulations of the different foreign countries with which the United States have intercourse, as have been adopted, and come to the knowledge of the Executive was received from the Department of State, furnished in pursuance of a resolution of the House of the 30th Jan. last.

Tuesday, Feb. 3. A resolution was offered by Mr. Lane, "That the Committee in the Judiciary be instructed to enquire into the expediency of authorizing the public stock of the United States to be purchased and sold by the courts of the several States."

The House in Committee resumed the consideration of the bill making provisions for surveys on roads, &c. Mr. Barbour advocated the bill, and Mr. Tucker and Mr. Kives spoke in opposition to it.

Wednesday, Feb. 4. No business of general importance was finished on this day.

MASSACHUSETTS LEGISLATURE.

IN SENATE.—Wednesday, Feb. 4. The bill for the reduction of the salaries of the Governor and other officers of the government was negative.

The bill for fixing the number of the Judges of the Supreme Judicial Court at four was also negative.

Thursday, Jan. 5. A bill relating to Grammar Schools was taken up, and a motion made for its postponement, which was negative, Yeas 15, Nays 20.

Friday, Feb. 6. A Committee was appointed to inquire into the expediency of altering and amending the act giving to Executors and Administrators the right to give in evidence any special matter under the general issue.

A committee was appointed to consider whether any further provisions are necessary for obtaining and setting off of judgments between parties having demands against each other.

Saturday, Feb. 7. The Committee on the subject of appropriations to Harvard College made a report recommending the following annual grants for the term of five years next ensuing from the tax on banks, viz. To the University of Cambridge \$6000. Williams College \$2000; and the Berkshire Medical School \$1000.

Monday, Feb. 9. The Committee on Banks was ordered to prepare a bill more effectually to provide against the frauds of Cashiers and other officers of Banks.

Tuesday, Feb. 10. A printed copy of the correspondence of the Agents for the Massachusetts Claim, was ordered to be furnished and printed.

A Committee on the subject reported that the business might be completed and the Legislature have a recess on the 18th inst.

HOUSE.—Thursday, Feb. 5. The committee on the subject reported that no interference is necessary respecting Primary Schools. No other business of a general nature were completed this day.

Friday, Feb. 6. A number of bills were finished, mostly of a private and local nature.

A bill authorizing femmes covertes to join with the guardians of their husbands in the sale of real estate passed to be engrossed.

A bill to alter and amend an act to provide for the instruction of youth, and for the promotion of good education was read a second time and committed.

A bill to prevent fraud in the admeasurement of salt and grain was read twice.

Saturday, Feb. 7. An order to direct the Committee

of Finance to include in the tax bill all sheep, owned by an individual, exceeding 10 was assigned for Tuesday.

A bill for the prevention of the Small Pox passed to be engrossed.

Monday, Feb. 9. A bill for the appointment of Inspectors, and regulating the manufacture of gunpowder passed to be engrossed.—Also a bill to repeal an act restraining the issue of printed promissory notes.

NEW AND VALUABLE IMPROVEMENT.

JUST received, and for sale at the Agricultural Establishment, No. 20, Merchants' Row, Willis' highly approved patent Straw Cutter; for simplicity, ease, and despatch in cutting straw, hay, &c. far exceeds any now in use.—Likewise, Safford's improved Straw Cutter; with a variety of common Hand Machines, for the same purpose.—Also, W. James' improved patent Corn Sheller, a very valuable and simple Machine.

GREECE.

Climb of the unprotected brave!

Climb of the ancient and the free!
Whose blood-stain'd banners boldly wave

'Mid storms that rock the Ægean sea,

With arm supine, and careless thought,

Why gaze we on thy conflict dire?

To win that prize our fathers bought,

Why tamely see thy sons expire?

True,—we can glow at Homer's lay,

Enraptur'd hang o'er Pindar's lyre,

Start at thy pencil's deathless ray,

Thy breathing marble's force admire,

At awful Marathon can list

To catch the Persian's tone of shame,

At proud Thermopylæ assist

To bind the immortal wreath of fame,

But when from slaughter'd Scio speeds

The Moslem curse, the helpless cry.

The echo of unutter'd deeds,—

We tax our pity with a sigh!

Oh ye! who saw the mighty yield

On Saratoga's laurel'd plain;

Or bade on Monmouth's fervid field

Your wounded bosoms flow like rain—

Rise!—tho' your wasted locks be grey,

Tho' chill'd with want your last retreat,

Lift high the wither'd hand, and say

How strong your kindred pulses beat—

Rise!—tell your sons what generous pain,

What warm, indignant zeal revives,

When, 'gainst oppression's wretched chain,

The crush'd, yet lofty spirit strives;

And tell their cradled babes the tale—

How oft to wrest the tyrant's rod

Do Liberty and Truth prevail,

Clad in the paupers of God,—

Then, ere the holy tear shall cease

To dew their cheek like rose-bud fair,

Devoutly stamp the name of Greece

Deep, on their unpolluted prayer.

MISCELLANY.

Manufactures.—I have seen a statement, which Mr. Prall, of New-York, has submitted to the committee on manufactures, respecting his extensive cotton factory, at Mamaroneck, in the county of Westchester. It appears from this schedule, that Mr. Prall has upwards of six thousand spindles in operation; that 600 bales of cotton averaging 300 pounds each, making a total of 180,000 pounds, are annually spun; that the whole number of persons employed in the factory is 425; and the amount of their compensation \$25,000. Mr. Prall is also concerned in two other establishments, and the whole amount of cotton, which he purchased for the use of these manufactories in 1823, amounted to \$19,600 pounds. Can any one look at this statement—at the quantity of raw materials consumed—at the number of persons employed, who would otherwise remain idle—at the amount of capital put in circulation among the poorer classes of the community, and for a moment doubt the policy of affording adequate protection of domestic manufactures. I should suppose that even the cotton growers of the south would not hesitate to support a policy, which opens in the north an extensive market to their staple commodity. Mr. Prall is now

at Washington, and has brought on with him a great variety of specimens of cotton thread, spun in his factory, some of which exceeds in fineness, any thing of the kind which has met my observation.—*N. Y. Statesman.*

Cultivation of Tobacco in Canada.—It is stated in the Quebec papers, that although this year has been unfavorable for the cultivation of Tobacco in the Western District of Lower Canada, 300 bbls. of that article would be shipped next spring. A petition had been presented to the Assembly from this district, praying the mediation of the House with the British Parliament, for the adoption of such measures as might encourage the cultivation of tobacco; on the reading of which, it was stated "that there was no doubt it would succeed in most of the District—certainly in all west of Lake Ontario—and that the quality of such as has been raised, was approved of by the manufacturers in the Lower Province."—The object in view appears to be an abatement of duty on Canada produce sufficient to put it at par with the tobacco raised in the United States, where, it is said, it cannot be supplied at a lower rate than at present, owing to the expense attending the slave population. The duty in Canada is four shillings a pound, and it is thought a deduction of three pence only, would effect the designed object. The petition was referred to a Committee.—*N. Y. Evening Post.*

Military Talent.—The time is fast approaching with the many, and now is with the few, when mere military talent, abstractedly considered, and without any reference to the ends for which it is displayed, will hardly secure its possessor a glory more long lived than a gazette. Posterity will appreciate the merit of great commanders, not by the skill with which they have handled their tools, but by the uses to which they have applied them.

A Just War.—Where a nation rises with one consent to shake off the yoke of oppression either from within or from without, all fair concessions having been proposed in vain, here indeed we have a motive that both dignifies the effort and consecrates the success; here indeed the most peaceable sect of the most peaceable religion might conscientiously combine. But, how few wars have been justified by such a principle, and how few warriors by such a plea! In the motley mob of captains and of conquerors how few Washingtons or Alfreds shall we find!

Large Establishments.—As large garrisons are most open to multitudinous points of attack, and bloated bodies expose a large surface to the shafts of disease, so also unwieldy and overgrown establishments afford an enlarged area for plunder and peculation. He whom many serve, will find that he must also serve many, or be himself disserved: and the head of a large establishment, is too often only the head of a gang of petty conspirators, who are always plotting against the chief.

Indolence shortens Life.—Sir John Sinclair, in his remarks on longevity states that in the examinations of those who have lived to a great age there were only two questions in which

they all agreed to answer in the affirmative. The questions were these; "were you descended from parents of good health and constitutions? And have you been in the habit of early rising?" Early rising therefore only gives us more life in the same number of years, but adds to their number; and not enables us to enjoy more existence in the same measure of time, but increases the measure.

ANECDOTES.

In the autumn of 1789, Washington, then president of the United States, visited the East States. The Universal and spontaneous expressions of gratitude and respect, which were covered by the people, in every stage of progress, afforded the liveliest and strongest testimony of their attachment to their illustrious hero. In no instance, perhaps, were feelings and affections of the people more cordially and heartily expressed than by Mr. Northey, the Chairman of the Selectmen of Salem. This gentleman was of the society of Friends, and when the President was presented to the Selectmen, Mr. Northey took him by the hand, covered, and addressed him in the following plain and peculiar, yet cordial and affecting language:—"Friend Washington, we are glad thee, and, in behalf of the inhabitants, bid thee a hearty welcome to Salem."

An Irishman who had just landed, said first bit of meat he ever ate in this country was a roasted potatoe—boiled yesterday. I you dont believe me, I can show it to you, have it in my pocket now.—*Communicated.*

NEW ENGLAND MUSEUM

76, COURT STREET, BOSTON.

CONTAINING much more numerous Collections and greater variety of entertainments than other Establishment in America, continues steadily to increase, and is open for the reception of visitors EVERY DAY AND EVENING.

It will be constantly in the best possible condition and every exertion made to render the visits of it most agreeable.

This Establishment now contains FIVE former unions united in ONE, together with very great numerous additions (the whole receipts being paid out to increase it.)

JUST ADDED.

The celebrated Race Horse Eclipse, A beautiful Cosmorama View of London, A large and beautiful live Rattlesnake, The Arabian Bottle, made of the stomach of a Camel—holds about a barrel—used to carry across the desert.

The Invalid's Chair—very ingenious—invented by Professor Peck.

A very large and elegant Sword Fish, upwards of 14 feet long, with a sword 4 1-2 feet long. The Museum is well lighted, and a Band of Music performs every evening. Admittance 25 Cts.

BRISTOL CROWN GLASS.

150 BOXES Bristol Crown Window Glass, of superior quality, just received and for wholesale and retail, at the very lowest prices, by BRIGHAM & DELANO, No. 30, Union Street.

TERMS OF THE FARMER.

Published every Saturday, at THREE Dollars per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

NEW ENGLAND FARMER.

PUBLISHED BY WILLIAM NICHOLS, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

OL. II.

BOSTON, SATURDAY, FEBRUARY 21, 1824.

No. 30.

Address to the Essex Agricultural Society, in Massachusetts, at Topsfield, Oct. 6, 1823. By Frederick Howes, Esq.

Agriculture is a subject on which it is difficult to say anything that has the merit of being both original and useful. In England about an hundred different volumes have been published on this subject within the last thirty years. Though our own country has not been prolific in agricultural publications, yet more have been written than most farmers have time or inclination to peruse. It is not with the expectation of communicating any original information on this topic that I have been induced to comply with the request of the Trustees to make some remarks on this occasion, but with a wish to call your attention to this most important of all arts, to some of the means by which it may be improved in this country, and some of the motives to make spirited and arduous exertions for that purpose.

In a poem on Agriculture, and one of the finest written on any subject, we are told that it is not the will of the Deity that the mode of cultivating the earth should be easy, but that could require art and labor to sharpen the tools of men by the cares and difficulties attending it.* Though this is the sentiment of a pious poet, every practical farmer is convinced that it is no fiction.

In sacred writ we are informed that the earth is cursed for the transgression of man, that it should bring forth thorns and thistles, and that should eat bread in the sweat of his brow. It is supposed by some that after the flood the earth was removed when the Supreme Being would no more curse the earth for man's sake.

Others suppose the earth to be still under the influence of this malediction. We leave this question to be settled by learned divines. It is sufficient for us as practical farmers to know that man must still get his food by the sweat of his brow, that to the fruitful earth still brings forth thorns and thistles, but that she abundantly rewards the pains and labors of the active, industrious, and skillful husbandman. Our beneficent Creator has placed us here to cultivate the earth, and all the seeming difficulties and hardships attending it are tempered with much kindness, and many blessings. They quicken and invigorate the corporeal and mental powers, and may in their ultimate consequences be real blessings.

One of the most important objects for the attention of a farmer is, by what means the soil is rendered sufficiently fertile for the production of good crops, and where it is already fertile, by what means its fertility can be increased. It is unfortunately the case in many parts of the United States, especially those bordering on the Atlantic, that lands naturally fertile, have been so exhausted by a succession of crops in tillage with little or no manure, as to be of small value. In some of

the Southern states this system of killing land, as it is termed by one of their best farmers, has been carried to such an extent, that there are many tracts of land which once produced great crops, now entirely exhausted and converted into a barren sand. In our own state and county perhaps there are not many instances where the impoverishment of the soil has been so extreme, but I apprehend that the fertility of a considerable portion of our land has been diminished, that in many instances it is now on the decline, and that there is much land in New-England, that will not produce more than half of what it formerly did.

This practice cannot be too much reprobated. It is disgraceful and ruinous to the farmer, a criminal abuse of the bounties of nature, and if universally carried to the extent to which it has been in some instances, would render the earth little better than an uninhabitable desert. The powers drawn from the soil by the production of crops, should be restored to it by manures in some shape or other. The farmer whose husbandry thus exhausts his land of its fertility ought not to be called a cultivator of the Earth, but a robber of the soil, a robber of the public, and of future generations. This sort of robbery has been ten thousand times more hurtful to the prosperity of the community, than all the highway robberies committed in New-England from its first settlement to the present time.

A good farmer would not only endeavor to reserve the original fertility of the soil, but to increase it, till it was carried to the highest degree of which it is susceptible, consistent with his interest and profits. It is a most important inquiry by what means can a sufficient quantity of manure be obtained, what kinds will be the most beneficial in proportion to the expense, what are best adapted to the soil of his farm, and what will be the most beneficial application of them? Here the most learned man and the most skillful farmer, will find ample occasion for all the knowledge they have derived from study and practice, science and experience.

Barn or stable manure is one of the best means of enriching land where it can be procured in sufficient quantities; but according to our present modes of farming this can seldom be done, except in the vicinity of large towns, and even then, I doubt whether farmers can afford the high prices for stable manure at present demanded. It is not difficult for a man of fortune who regards not the expense, to enrich his land so as to produce great crops. But the question with farmers in general is, and ought to be, how it may be profitably done. If the expense exceeds the product, it will not do for them. It is not sufficient that the crops are large, but do they afford a net profit. The true object of the farmer is to cultivate his land in such a manner as will afford the largest profit, after deducting rents, taxes, labor, and all expenses of cultivation.

The manure from the barn I believe might be very much increased, perhaps doubled or tripled, if the yard were covered with earth, turf, or vegetable matter to a depth sufficient to

absorb all the liquid manure. Every part should be secured as much as possible from exhalation by the heat of the sun.

It seems to be generally agreed by English Agriculturalists, that stable manure by fermenting loses a great part of its value. Mr. Cole, the great English Commoner and Agriculturalist, says, that by using his manure fresh, it went twice as far as it did formerly, when used after fermentation. As a general rule it cannot be doubted that it is much better to apply manure to land in tillage than in grass. In the latter case a great portion of it is lost by evaporation.

MINERAL MANURES. It seems very desirable that the mineral manures should have a much more effectual and extensive trial than they ever have had in this country. The virtues of lime have been so highly extolled, and it has been in fact so powerful a fertilizer of land in other countries, that it deserves a full and fair experiment here. Experience seems to have shown that lime when applied in so small a quantity as twenty bushels to the acre, may alter the texture and constitution of the soil, and render it fit for the production of crops of which it was before incapable.

A late and excellent writer on agriculture says, "it is inconceivable what effect lime has on the productiveness of the earth. Philosophers have investigated its nature and properties to find out the secret spell by which it works, and while some have attributed the effect to its power of decomposing putrescible matter, or to its affinity for carbonic acid, others have ascribed it to the change effected on the constitution of the soil. All however are agreed that no land after its first and natural richness has been exhausted by cropping, can continue fertile without a mixture of this fossil. Its use was the first thing which revived English agriculture after it had long languished in the most abject state, and the first thing which raised Scotland to opulence and independence. Lime, as a manure, has found its way into France and Germany, and it is blended with the soil along the shores of the Baltic. In Southern latitudes this mineral manure is more generally applied, either incorporated with clay in the shape of marl, or combined with sulphuric acid in that of gypsum."*

There is one circumstance which seems to render the beneficial effect of lime in our country very probable. The soil of Essex with very few exceptions, is either what Geologists call the primitive rocks, earth resulting from the decomposition of these rocks, or of alluvial, the washings and depositions of the primitive. We have I believe no limestone, and the quantity of lime in our soil must of course be much smaller, than in a soil resting on lime stone. The less we have in our soil, the more beneficial would its application probably be, and greater in such a soil as ours, than in one of a different formation. An additional incitement to the use of it is, that in Pennsylvania, where probably more lime has

* Pater ipse colendi
facile esse viam voluit, primisque per artem
agros, curis acuens mortalia corda.

Georgica I. 121.

* Letters of Agricola.

been used for manure than in all the other states, a much smaller quantity has been found sufficient than is frequently applied in England and Scotland, probably owing to the greater portion of calcareous matter contained in the limestone used in this country. Thus though lime might be dearer here, in proportion to its bulk than in Great-Britain, it might be cheaper as a manure on account of its superior strength, or in other words, the greater portion of pure lime in our limestones. If twenty, thirty or forty bushels of lime applied to an acre will produce a great and permanent improvement in the constitution of the soil, and contribute by its solvent powers to render animal and vegetable manures more efficacious, then lime may prove one of the most effectual modes of enriching our lands.

GYPSUM OR PLASTER OF PARIS. This mineral has in many parts of our country produced a wonderful effect, and contributed perhaps more than any other cause to the improvement of agriculture in those places. It is supposed that near the sea coast it has little or no effect, and has in some instances been tried without success. It appears to me that further trials are desirable. It is a manure so cheap, so small a quantity, as one or two bushels being sufficient for an acre, has produced such great crops elsewhere, that it seems expedient to make additional experiments to ascertain whether it may not be beneficial for some kinds of soil in our country, or perhaps for some particular crops. The reason assigned by that eminent chemist, Sir Humphrey Davy, why gypsum produces little or no effect on some soils, that those soils probably contain it already in sufficient quantities, does not appear satisfactory. The mode in which it operates is not well understood, but if our soils already contain gypsum enough, why does it not display its powers in the production of good crops here, as well as in the lands in Pennsylvania, and on Connecticut River? The experiment should be made on light sandy soils, or on a dry loam. On clay or on wet soils, gypsum it is said does not succeed.

Sand and clay operate as manures for each other. Where there is an excess of sand in the soil, clay is one of the most beneficial manures, and on the other hand, where there is an excess of clay, it is remedied by the application of sand. The improvement of the soil in these cases is lasting, and not like that produced by vegetable and animal manures exhausted after a few crops. A permanent change is produced in the texture and constitution of the soil, it becomes better adapted for the reception of manures of a different kind, and will render them much more efficacious.

In this county, from the dryness of the atmosphere, and the nature of our soil, we suffer more from dry seasons than wet ones. But a small proportion of our lands require draining for tillage, and especially for grass. There are however some tracts of land in various parts of the county, which must be drained to be productive. These are often composed of rich earth, washed in a long course of years from the higher lands adjacent, and of vegetable matter the accumulated product of centuries and if rendered sufficiently dry, would probably produce large crops. It is well known to every practical farmer, that the first requisite to the successful cultivation of such lands, is to lay

them dry, that till this is done labor, tillage, manures, and all efforts to render such land productive, will be in a great measure fruitless. The facility of draining here is generally much greater than in England, and it will seldom be necessary to resort to the covered drains so common in that country, and so expensive.

An essential requisite of good husbandry is, that the soil should be kept free from weeds. In this particular there are among us great deficiencies. We are the less excusable in not keeping our lands free from weeds as we have one crop which is peculiarly favorable to that object, I mean Indian corn or maize. This alone gives us a great advantage over those countries where it is not cultivated, that is over almost all Europe. Perhaps we are not fully aware of the value of this noble plant. The celebrated Arthur Young considers it as the test of a good climate for agriculture. In Great-Britain and the larger part of France, it will not come to maturity, the climate is too cold. In the south of France and in some parts of Italy it is cultivated to a considerable extent. Mr. Young says, the only good husbandry he found in France was in those districts where maize was produced. Wherever this plant was cultivated, there was an abundant supply of food for man and for domestic animals.

Our soil and climate are well adapted to the growth of maize. It produces a much larger quantity of food on the same space, than any other kind of grain; forty, fifty, sixty bushels an acre, are not an uncommon crop, and several experiments shew, that one hundred bushels may be obtained in ordinary seasons, from a single acre. The stalks and husks afford a nutritive food for cattle equal on an acre to half a ton of hay, when the corn is good.

It affords an excellent opportunity for enriching land, so that no manure may be lost by evaporation. All kinds of manure, animal, vegetable, or mineral, and in any condition if turned under the soil are beneficial, and may be applied without danger. I mentioned it in the first instance as a clean crop, that is a crop that enables the farmer to keep his land free from weeds, and prepare it for another. In England where turnips and beans are used as crops for cleaning land, the value of the crop is much less than that of Indian corn, and the expense of cultivation much greater.

In order to obtain the full benefit from the cultivation of this crop, the land should not only be rich, but kept entirely free from weeds. The propriety of doing this is so obvious that, the remark may seem unnecessary, yet if we take a survey of the cornfields in this county, I apprehend we shall find frequent violations of this rule. In many instances, after waging a warfare during the season, the weeds have finally obtained the ascendancy, their seeds have been allowed to come to maturity, and prepare the soil for a still more abundant crop of weeds the ensuing year. From the appearance of some fields in tillage, it might be imagined, that the object of the farmer was to bestow just so much cultivation as should produce a plentiful crop of weeds, who, as if they had a right as being the original occupants of the soil, are allowed to retain possession and repel any intruders. By allowing weeds to remain till their innumerable seeds ripen, we not only injure ourselves but our neighbors. The heavier seeds intrude upon their frontiers, and the wing-

ed kinds matured in our neglected grounds the air like the noxious locusts of other regions, and either choke the crops of our neighbors or make work for their hoes.

Our soil is well adapted to grass, both pasturage and mowing land, and the climate generally very favorable for making hay. The vicinity of large towns, few crops are profitable than grass, and few are obtained so much ease. So long as lands thus situated will produce a good crop of grass, perhaps a general rule it is not expedient to apply it to any other use. But most of our mowing lands fail in a few years, and become necessary break them up for tillage, and on almost every farm of any magnitude it is necessary to convert tillage and grass husbandry, in order to keep land in good condition. The laying of less grass is an important part of the farmer's business. The two grasses, whose seed is commonly sown, clover and herds grass, are both good, but it might be expedient to try other kinds, especially in laying down pasture lands. Pasture as well as mowing lands were always laid to grass in a rich condition, with plenty of the kinds of seed adapted to the soil many times would produce double the quantity of hay at present, and be also in a better state of tillage when broken up. But no farmer should put his plough into grass land unless after a course of crops in tillage he can lay it to grass in a condition at least as good as it was before.

In ploughing hilly land it is very important to prevent the soil from being washed away by rains. Much injury has been done to lands in this description, by the wasting effect of rain on the land gullied the vegetable mould and the best earth washed away, and the soil either irretrievably injured, or to such a degree, that fertility could be restored only at a great expense. The method of horizontal ploughing practised in some parts of Virginia, seems most effectual security against this evil.

As an instance of what may be done by an active, and skilful farmer, I will mention the case of that celebrated English farmer, Robert Bakewell. Mr. Bakewell was a tenant occupying a farm of four hundred and forty acres, about fourth arable, and the rest grass. On this farm and from the produce of it, he kept one hundred and fifty homed cattle, four hundred sheep and sixty horses. These animals were all fed, in an excellent condition, and many of them the best animals of the kind in the kingdom. Mr. Young, who visited this farm, who gives this account of it, says, "the cattle were all as fat as bears." If the live stock on a farm of one hundred acres were in the same proportion, there would be thirty four neat cattle, ninety sheep, and fourteen horses. This was undoubtedly an extraordinary instance, it proves how productive the soil may be rendered by judicious cultivation.

I am of opinion that by skilful management it is practicable to keep a farm in a condition of constant improvement for an indefinite time, and render it from year to year, the season being equally good, more productive;—and that it may be done from the resources of the farm without any great expense in the purchase of materials to enrich it from abroad. Amongst the means necessary for this purpose, would be to comprehend, a due proportion of grass, and tillage husbandry, making as much manure as possi-

igent search for, and application of all kinds of manure, whether mineral, vegetable, or animal, which may be procured without any great expense, a judicious rotation of crops adapted to the soil and the probable state of the markets, thorough and complete tillage of the arable land, and the destruction of all weeds, so that the powers of the soil should be wholly applied to the production of useful crops.

The great defect common in the husbandry of this county the want of root crops, has been noticed in this place, in former addresses, and the great advantage of these crops for live stock described and demonstrated in the most satisfactory manner. Among these I believe the Mangel Wurtzel, or great beet, and carrots, preferable to any crops of the kind that have been tried here. They afford a much more nutritious food for cattle, and a larger produce (especially the Mangel Wurtzel) to the acre, than turnip with which we are acquainted. It is well ascertained that the Ruta Baga, when fed to cows, communicates a bad flavor to the milk, though it may be good food for other stock. Our long and severe winters, render necessary to lay in store so much food for live stock, and the tap-rooted plants when well cul- tured, afford so much, and of such an excellent quality, that no farmer who is able to cultivate them in a husband-like manner, should be at a plentiful supply of vegetables.

A principle which cannot be too strongly recommended to every farmer, is to have his stock, and all the products of his farm the best of the kind, the best kinds of hay and the best butter, cheese, fruits, cider, &c., and other vegetables, for the market. Difference in point of expense in the production trifling between very good, and or- dinary, but in the price of these commodities the profits to be derived from them, the difference is very great. Articles of the quality will always command a good price, those of an inferior quality, though pro- duced nearly or quite the same expense, per- cannot be sold at all, or sold only at a loss. Perhaps we may derive some encouragement and vigorous efforts to improve our husbandry, if we compare it for a mo- ment with that of England, and take a view of all the advantages and disadvantages of English and American farmer. In England, the acre is carried to a much higher degree of cultivation than in other countries, with the exception of Flanders, Lombardy, and parts of Switzerland, and Scotland. This is well known, by any superior soil or climate, enjoyed by England over other countries of Europe. Arthur Young, an excellent judge, after making his agri- cultural tours over France and England, says, "In soil, and climate, France has the su- periority over England, but the produce of the country by the acre, was on an average, or quite double to that of France, over- superior cultivation. Our own agricul- ture is probably inferior to that of England."— There is no doubt, exceptions to this remark, but in general position it is unquestionably true. What are the causes of this superiority? Are the advantages of soil, climate, or pos- sibilities, which the English enjoys, the American farmer? Or is the difference

owing to the superior industry, skill and liberal application of capital in English agriculture?

In England the greater mildness of the weather in winter, enables a farmer to prepare his land earlier for a spring crop, to feed his turkeys on the ground, and prosecute some operations in agriculture which the severity of our winters renders impracticable. The winter is both milder and shorter, the atmosphere being more moist, is in some respects more favorable to vegetation, and they suffer less from drought than we do. Vegetation is however more rapid here than in England, and though our spring is later, our harvest is earlier. Hay is also cut earlier here, and owing to the su- perior dryness of our atmosphere is much more easily made than in England. Indian corn gives us a great advantage over the English farmer, as has been already mentioned.

With respect to the soil, a skillful observer, Chancellor Livingston, after an attentive examination, is of opinion, that the soil of the United States is not inferior to that of France, Great Britain, Italy, Flanders and Germany.— The soil of our own country is not so good as that of some parts of the United States. A very considerable portion of Essex, however, is naturally fertile, and if agriculture does not flourish more with us, it cannot, I think, be justly ascribed to any defect in our soil or climate.

[Remainder in our next.]

Roxbury, Feb. 13, 1824.

T. G. FESSENDEN, Esq.

Sir,—Having called several times at the Shakers' Village, in Canterbury, N. H. during the past year, among their numerous economical arrangements, I was much pleased with their mode of keeping fresh meats during the winter and late into spring. By this means, they kill off a considerable number of animals and poultry in December and January, and preserve them for use, (saving the expense of food and labor attending them) during the whole winter.—I had hoped to have received this statement in season for our last Agricultural Repository, but was disappointed.—I think it might do good, though now getting late in the season, to publish it, in your valuable paper.

The receipt for making soft soap, may also be useful to publish.

Respectfully yours,

JOHN PRINCE.

Canterbury, Jan. 26, 1824.

MUCH RESPECTED FRIEND PRINCE.—Your letter of the 22d Dec. was duly received, but I regret to say, that it was at a time in which I was preparing for a long journey, and therefore could not immediately answer your request with regard to giving you information, as respects the keep- ing of fresh meat, and the making of soap: nor have I, till this instant, (in consequence of a crowd of business,) had any convenient opportunity to write. However, if it will be of any service to you, or the public, at this late period, you shall be welcome to the following hints.

To keep Fresh Meat good during winter and spring.

Dig a cave, if convenient, under the north side of a building where the ground descends considerably to the north; wall it all round with stone or brick, except the passage on the north side, which should be an entry way, furnished

with three doors, at some distance apart; the middle one to be made of slats, the other two made whole in order to shut close. Having cut the meat into large pieces, permit it to freeze thoroughly; then place it in the cave upon shelves prepared for that purpose, and cover it over with tow sheets, upon which snow may be laid if necessary. The doors are to be kept closely shut during moderate or thawey weather; but they should be occasionally left open when the weather is cold, in order to let in the frost. The middle door is for the purpose of keeping out carnivorous animals while the others are open; the other two are to prevent the warm air from penetrating the cave, the grand object being to keep the meat in a frozen situation.

With due attention meat may be kept fresh and good in this way, from December till April and perhaps for a longer time.

Where it is not convenient to make a cave under a building as above, it may answer a good purpose to dig it in any other convenient place where the ground descends sharply towards the north: but in this case it should be covered over with flat stones and earth; and also with a wooden roof in order to keep out the rain.

An easy method to make good Soap.

The vats or vessels containing it are to be situated in the rays of the sun; and at the same time sheltered from the rain.

To one barrel of good lye sufficiently strong to bear up an egg, add about six gallons of clean melted grease, and thus in proportion for any other quantity.* Stir the mixture well together, and repeat the operation twice daily, till it becomes so thick and stiff as to render stirring impracticable. Let it stand in this situation thro' the summer; or till needed for use, adding a little weak lye occasionally as the soap dries away.

With due respect, your friend,

FRANCIS WINKLEY.

* Or add as much grease as the lye will absorb, or eat up.

To purify River or any other Muddy Water.— Dissolve half an ounce of alum in a pint of warm water, and stirring it about in a puncheon of water just taken from any river, all the impurities will soon settle to the bottom, and in a day or two it will become as clear as the finest spring water.

Warm Water.—Warm water is preferable to cold water, as a drink, for persons who are subject to dyspeptic and bilious complaints, and it may be taken more freely than cold water, and consequently answers better as a diluent for carrying off bile, and removing obstructions in the urinary secretion in cases of stone and gravel. When water, of a temperature equal to that of the human body, is used for drink, it proves considerably stimulant, and is particularly suited to dyspeptic, bilious, gouty and chlorotic subjects.

To make Sea water fit for washing Linen at Sea.—Soda put into sea-water, renders it turbid, the lime and magnesia fall to the bottom. To make sea water fit for washing linen at sea, as much soda must be put in it, as not only to effect a complete precipitation of these earths, but to render the sea-water sufficiently lixivial or alkaline. Soda should always be taken to sea for this purpose.

From the Old Colony Memorial.

AGRICULTURAL STATEMENT.

By Doct. MACOMBER.

To the Trustees of the Plymouth County Agricultural Society.

[Concluded from page 226.]

In the spring of 1823, vegetation in general was backward, and the grass in the swamp appeared not more promising, than in many other places, but as the season advanced, the growth became more rapid, and by the last of June the grass was stout. Though the grass had lodged a little in some places, yet it was growing more rapidly the first of July, than it had done at any previous time. A small part only of the herdsgrass and fine top and less than half the clover had blossomed. While in this flourishing state, a heavy rain on the 6th of July brought the clover with much of the herdsgrass and finetop to the ground. The next day on examining the grass, I found that the decay at root in future would probably much more than balance the gain of grass at top; and that though the crop might gain in weight by standing longer, yet would lose in value, and that a second crop would be proportionally less valuable. I therefore determined immediately to cut it, though the shrink might be greater, and the weight of the crop considerably less. I resolved not to sacrifice substance to sound.

On the 8th of July, I began mowing the swamp; although it was misty, and the atmosphere was loaded with vapors. At noon the clouds disappeared, and seven days of as fine hay weather succeeded, as are usually seen. The greener and more sappy hay lay exposed to the sunshine of five successive days, having been cocked at night and spread out in the morning. I was told by some that I made it too much; but though it was abundantly dried, yet I think it will gather sufficient moisture in the mow to be good hay, and I have no apprehension, that it will be mowburned. It was carried into the barn, a distance of a few rods only, upon poles, and weighed during the heat of the afternoon, and on the 14th of July the weight was found to be 7739 lbs. or 3 tons, 9 cwt. 11 lbs.

On the 31st of July the swamp was surveyed by Joseph Clift, jr. Esq. with the assistance of the man, who was chiefly concerned in cutting the grass, making the hay, and weighing it; and was found after making a deduction for the unproductiveness of ditches and drains, to contain one acre and thirty-four rods.

On the 9th of September we commenced getting the second crop on the swamp, and on the 17th the weight of the same was ascertained to be 4102 lbs. or 1 ton. 16 cwt. 70 lbs.

This, added to the weight of the first crop, gives in the whole 11841 lbs. or 5 tons, 5 cwt. 31 lbs. which is after the rate of 4 tons 7 cwt. 21 lbs. per acre.

The swamp is not yet "tabula rasa." It is not exhausted by the energies, it has already put forth. During the nine days, we have been employed in getting the last crop, it has shot up spires of grass more than 7 inches above the cutting. Already it assumes a delightful verdure.

Thus it appears, that the wealth of our country lies buried beneath stagnant water, and an exuberance of useless herbage and bushes,

fruitful source, teeming with the seeds of fever, and giving off to every breeze the noisome breath of pestilence. And shall we sleep on regardless of the truest interests of agriculture? regardless of our health? Shall we tread beneath our feet, as worthless, sources of wealth far richer than the mines of Potosi? Shall we go on still negligent of those great depositories of vegetable life, from whose prolific bed might be drawn an amount of food, equal to the support of a population, many times exceeding the present population of the United States?

Without doubt the writer might have reared on his swamp much greater crops, than those stated in this paper, if he had made a free use of manures; but if he had done this, it would have been said by many 'these crops are not the effect of the richness of the swamp-soil; they are the effect of manures.' There is now no place for this kind of reasoning. No wagon-wheels groaning beneath the pressure of compost have passed over this spot; nor has the soil, already blackish, been blackened by manures. The soil needs little manure. Swamp-soil is in itself manure; and is in truth the farmer's mine.

By judicious application of manures swamp-soil might doubtless be brought to yield as great crops of hay, as any soil whatever.—And it is probable, that instead of mowing it twice, it might be necessary to mow it three times in a season; in order to prevent its lodging. But robbing other lands of their proportion of manure to raise one piece to an unnatural fertility may be about as wise, as for a man to starve his stock of cattle to rear a fat ox to be exhibited at a cattle-show with this difference, that salt will preserve the ox when slaughtered; but it is uncertain, whether salt will preserve his three green crops of grass, unless at each time of cutting he should be miraculously favored with fine hay weather.

For reducing swamps and low lands to the necessary degree of dryness no specific rules can be given. The differences of situation and soil, the number of springs and brooks, and their relative position, the existence of shaking grounds, the unevenness at the surface, and the risings and depressions of the pan beneath, are matters, which demand correspondent differences of management. Much less will it be proper to adhere to the directions of European writers, for they have been conversant with soils widely different from ours. The circumstances of the spot of ground before us can alone dictate a judicious mode of procedure. When one writer tells us, that drained swamps will produce 4 tons of English hay per acre, and more than 90 bushels of Indian corn per acre without manure, we may safely believe him. When another writer tells us, that to drain a shaking ground we must dig the ditch at the outlet as deep, as the bottom of such ground, it will be best to withhold our assent; for swamps may be made so dry, as to produce but small crops of grass, while on the other hand they may be left in so wet a state, as to produce grasses only of the inferior kinds. In draining a swamp, it is not a little difficult to retain the proper degree of moisture; for it is not more vain to expect a plentiful crop of good grasses without the influence of the sun, than to expect such a crop without a considerable degree of moisture situated not far from the surface of the soil.

From situation some wet soils cannot be claimed by draining and ridge-ploughings, may be made good meadow by carting out on them sand and gravel, or compost, in sand is a principal ingredient. But this is frequently an expensive operation. It will be proper as well to count the cost as to calculate profit.

If any manures are necessary on swamp; they are such, as promote the decomposition of vegetable substances. But this effect sometimes be as well produced by ploughing for loosening and breaking up the soil by plough lets into it heat and air, which with water already present, are all the agents necessary to decompose and break down the soil give it the desired fertility.

The air is composed of an infinity of gaseous vapours exhaled from the bosom of the earth as much more fertilizing, than the more cold and earthy manures, as volatile alkali is more fertilizing, than the fixed. The atmosphere is a grand laboratory, in which God, the micro-chemist is continually carrying on an variety of operations, and while he is decomposing some atmospheric substances, is doubtless forming new compounds from others. The farmer, therefore, who ridge-ploughs his wet ground has the satisfaction of thinking, while he is forming drains in the most expeditious manner reducing his soil to desirable fineness, that he is likewise throwing it up (if the writer may be allowed the expression) within the influence of atmospheric manures, and is causing it to be in such a manner the recipient of a thousand gasses, that by the chemical action of these gasses and airs the quality of his soil is greatly improved.

The writer concludes by once more repeating a short sentence, that deserves to be written in letters of gold, "VENERATE THE PLOUGH."

EXTRACT

From an Address, delivered at the fifth Anniversary Meeting of the Saratoga County Agricultural Society, held at Ballston Spa, on the 8th of October, 1823. By EARL STIMSON, Esq. President of the Society.

"Industry, and economy combined, form true philosophers stone, which turns all gold. Without these essential qualifications one can be a respectable, or an useful member of Society. They are therefore among the principles which should be instilled into child from his earliest infancy.—They generally exist together, and are both so indispensably necessary to success in any pursuit of life, that where one is wanting, the other all practical purposes may as well be absent. For without industry, economy will be of no avail.—And without economy, the fruits of industry are soon wasted.—Man being formed for action, and duties always devolving upon him, industry and economy cannot be dispensed with in any situation in which he can be placed in the want of these, that prevents the success so many in the various mechanical branches as well as in the learned professions—and it is a primary cause which calls in the aid of the solvent law to close up the concerns of society in the mercantile world.

"The indolent person soon loses the confidence, and of course the patronage of his

players, and poverty, and disgrace are the final, and inevitable result. But in no one, are the unhappy effects which result from the want of these, more apparent than in the cultivator of the soil. The indolent farmer exhibits his own disgrace to every passing traveller; and brings forcibly to the mind even of the stranger, the words of the wise man—"I went by the field of the slothful, and by the vineyard of the man void of understanding, and lo it was all grown over with thorns, and nettles had covered the face thereof, and the stone wall thereof was broken down." How true is the picture which Solomon here gives of what daily falls under our own observation. How often do we see a farm susceptible of a high state of cultivation, and which might with any thing of industry and economy be a source of wealth to its possessor—how often do we see it grown over with bushes, briars, thistles, and every hurtful weed—the fields badly arranged, the fences out of repair, the land half tilled, the barn doors broken from their hinges, and the windows of the house filled with hats, presenting any idea but that of comfort.

"On a nearer examination, the picture is still darkened.—Look at his stock, his out-houses, his implements of husbandry; every thing poor and out of its place. Enter his dwelling—his home, that sacred place in which are to be found the only fruits of Eden which have survived the fall—is domestic peace and happiness ever found within, where neglect and ruin are without? Does not every thing wear the same aspect—and is there not inscribed on every thing on which the eye can rest, indolence and waste?

"Reverse the picture; and what can be presented more agreeable, what can be accompanied with more pleasing ideas. Look at the farm of the man who is diligent in his business, and prudent in his concerns—his own spirit is infused into every thing around him—every thing in repair, every thing is in its place, every thing is in its season;—every thing evinces that the master's eye has seen and directed all his concerns—and that he hath remembered and practised the adage—

"He that by the plough would thrive,
Himself must either hold or drive."

—On a nearer examination we find his fields well arranged and productive, his crops clean, and of the best quality, and secured in season after crop, instead of being exposed to weather in stacks as is too frequently the case, to the great loss of the farmer, both in the crop itself, and in the manure of which it might be productive—we find his cattle well fed—in good condition—and often better sheltered than the *swine* of the slothful. Enter his dwelling, it is the habitation of plenty—the store house of the airy and the loom—and his fire side, that calm and domestic one, where the farmer, in the bosom of his family, finds not only rest from his toil, but the richest reward of his labor.

"Since we are assembled for the purpose of mutually receiving and communicating instruction, and stimulating each other in that pursuit, which was the first, and is still the most honorable employment of man—it will be expected that something will be said more particularly to the cultivation of the soil. Agriculture embraces in its widest sense too many subjects to admit of a description in detail, within the lim-

its of a single discourse. Division and Fencing of a Farm, the proper mode of tillage—draining and watering of land—the rotation of crops—kitching gardening, that important, though much neglected subject—the planting and cultivating of fruit trees—different kinds of manures and their application—the raising and fattening cattle—the form and construction of farming utensils, the most proper mode of building, both as it respects the form and materials—and the different kinds of domestic manufactures would furnish matter for an useful discourse—but without descending to any particular discussion on any one of these subjects, suffice it to say that a knowledge of them all will be sought by the practical farmer. But permit me in compliance with the request of several gentlemen, briefly to subjoin a statement of what I have found to be the most successful and profitable mode of cultivating the farm which I have taken under my immediate care and upon which I have tried a number of experiments.

"The soil of this land is a brown loam, lying on a stratum of lime and sand stone, at the depth of from three to six feet, projecting out of the ground occasionally on the brink of ridges.—The surface was covered with round hard stone sufficient when put into half wall with posts and rails to enclose it in lots from five to ten acres. The original timber was principally beech and maple, mixed with bass wood, elm, and hemlock. The whole farm was interspersed with spots low and springy.—When first cleared the dry land was productive both in grain and grass.

"It was occupied as four small farms previous to its coming into my possession, and has been so often cropped without seeding down to grass or being supplied with manure as to become in a great measure unproductive not yielding the occupants on an average more than twenty bushels of grain to one ton of hay per acre.

"Little or no attention had been paid to the arrangement of the lots—the fences were in a decayed state and the buildings much out of repair, and the whole was much covered with old logs, stumps, stones, hedges of briars, unprofitable bushes and weeds. For the first four or five years after part of this land came into my possession, I pursued the common way of farming, and half ploughed and harrowed my land over the stones and around the logs and bushes—summer fallowed at the loss of one crop, and ploughed in what little manure I saved five or six inches deep. I laid out much labor and got small crops.

"Tilling my land with hired hands, I found on posting my account it was running me in debt instead of being a source of profit. This induced me to try some other method, and after several experiments having for their object the economy of labor, the procuring and application of manure and the rotation of crops—the following has proved the most successful.

"In the first place I drew a plan on paper arranging the land into square and convenient lots containing from five to ten acres having an eye to the convenience of water for each field and to the transportation of its produce to the barn where it was to be housed but with no regard to the unevenness of the surface or the swales of springy land. This land cost about twenty-eight dollars per acre. I commenced fitting the lots and continued year after year in

succession. The management of one may be taken as a specimen of the whole.

"I removed the rubbish at an expense of about \$2 per acre.—The loose stones were then removed and with posts and rails placed into permanent fence, at an average expense of \$6 per acre.—This expense added to the first cost of the land, makes an average of \$36 per acre, excepting repairs of buildings, when the land was fit for tillage. I then arranged my barn yards a little dising, where it was convenient, for making and preserving manure. I drew into them in the fall a quantity of turf and dirt from the knolls around my buildings and the adjacent roads and yarded my stock upon it during the winter. This course I pursued for a few years until my crops so increased as to furnish me with manure in a sufficient quantity to give each of my lots a slight coat once in five or six years. In the spring it was thrown into small piles in the yard. In the fall commenced ploughing with a good and faithful ploughman who turned over the sod about three inches in depth and from eight to ten inches in width. The dry part was back furrowed into lands of twelve paces and the wet into lands from five to six paces wide, leaving a deep dead furrow to answer the purpose of a drain. I spread over it from six to eight three horse loads of manure per acre and on the driest and most barren I have added three or four loads of old leached ashes—rolled it down with a roller five feet long and twenty inches in diameter. This was done to pulverise the lumps and settle the manure and land together.

"This I have done both in the spring and fall—the spring I have found the best time but not so convenient for carting manure. About the tenth of May it was well dragged, or ploughed with a one horse plough; if ploughed it was harrowed down and if it was wet and springy it was cast into small ridges by throwing two furrows together at a distance of two and a half feet from the centre of the ridges, but without disturbing the sod; then cross-marked at the same distance. About the fifteenth or twentieth of May it was planted with eight rowed yellow corn, twelve quarts to the acre, wet in a pickle made of six ounces of saltpetre, two quarts of boiling water, one gill of tar. This pickle was applied to the seed boiling hot, which immediately was rolled in plaster and planted. The head lands were planted with four rows of potatoes for the convenience of turning the horse so as not to break down the corn.

"After the corn was out of the ground six or eight inches, it was lightly ploughed both ways—one furrow in a row, dressed out with a hoe and plastered on the hill five pecks to the acre. After two or three weeks it was ploughed and hoed as before without disturbing the sod, and suckered before hoeing, leaving three or four stalks in a hill. The potatoes were hoed at the same time with the corn—the first time, the tops were covered about an inch and the hill left flat—the second time, the tops were spread apart with the hoe and about the same quantity of dirt applied on the hills as before. The whole of this expense including the manure and interest of the \$36 dollars did not exceed nineteen dollars and a half per acre.

"In the fall, I gathered on an average from sixty to seventy bushels of corn per acre fit for

the crib: which, at that time, was worth fifty-six, or sixty cents per bushel; and from four hundred and fifty, to five hundred bushels of potatoes, worth about sixteen cents per bushel. After the corn was harvested the hills were harrowed with a two horse drag—In the spring I ploughed it just deep enough to turn up the old sod which had become a fine vegetable mould for a spring crop and after harrowing the furrows down, sowed it with barley, washed in strong brine and rolled in plaster about two and a half bushels of seed per acre, harrowed it, and before cross harrowing it was seeded with four pounds of the large red clover seed and three quarts of timothy. After the barley was out of the ground one or two inches, it was sowed broad cast with plaster, five or six pecks, per acre, and rolled down to pulverise the lumps and smooth the surface for mowing. The expense of this crop was not to exceed ten dollars per acre. In this way the land was cleansed, enriched, and prepared for a further rotation of crops.

"The second rotation.—The sod was turned over the last of August or first of Sept., manured and rolled down as in the first instance. About the fifteenth of September, I sowed it with red chaff bearded wheat one and a half bushels per acre and harrowed it in. The seed was prepared by washing it clean in a strong brine made with salt, and immediately rolled in lime and I let it lie moist twenty-four hours to prevent smut and insect. In the fore part of May, five or six pecks of plaster were sowed broad cast to the acre. The expense of this crop including manure was about fourteen dollars per acre—the produce from 35 to 40 bushels per acre worth \$1, 25 per bushel.

"Late in the fall or early in the spring I turned up the old sod—harrowed and planted it to corn. Tilled as before mentioned except the barnyard manure—the expense about \$14 per acre—had from 30 to a 100 bushels per acre worth 44 cts. per bushel.

"In the fall or early in the spring I harrowed down the hills and in the spring prepared and sowed it with some spring crop suitable to stock down—sowed and rolled as before stated, produce from 50 to 60 bushels if barley—from 25 to 35 if spring wheat, and from 70 to 80 if oats—from 5 to 600 lbs. of flax per acre; and afterwards for two or three years, from 3 1-2 to 4 tons of hay, or pasture in that proportion per acre. Some seasons, instead of sowing wheat on the sod in the fall, I have turned it over in the spring, rolled and harrowed it, and sowed it with 3 bushels of small or 3 1-2 bushels of large white peas to the acre. After they had been washed in strong brine and rolled in plaster they were ploughed in on the top of the sod—when out of the ground one or two inches, plastered 5 or 6 pecks to the acre, and had from 30 to 40 bushels per acre—then in the fall, turned back the sod and manured it, sowed it with wheat as before stated, and have had from 40 to 45 bushels per acre. The third season have taken a crop of from 80 to 100 bushels of corn per acre. And the fourth stocked it down with barley. This I have found a good course when my ground was in heart so that it would answer to take from it four crops of grain before stocking with grass. With this mode of husbandry, as will appear from following out the above calculations, my land has afforded me a handsome profit."

NEW ENGLAND FARMER.

SATURDAY, FEBRUARY 21, 1824.

NEWLY INVENTED STEAM APPARATUS. We have seen some ingenious machinery for heating steam to a high temperature, invented by Mr. Joseph Dixon, of Lynn, Mass. which promises to prove of much utility. We shall attempt to give some idea of this invention, although without a diagram it will be perhaps impossible to give a clear explanation of its principles.

The Reservoir of water which supplies the Boiler or Generator is placed about 16 feet perpendicular height above the Generator, and the latter is supplied by a pipe, which descends from the former. A small distance above the Generator is placed a Cock with an Index and plate, to regulate the admission of water. The Generator is an iron tube, set perpendicularly in a brick furnace, made very strong, and strongly closed at top, except the aperture, which admits the tube from the Reservoir. Near the top of the Generator is a small tube, entering into the Boiler, and winding several times round to its bottom, and then rising perpendicularly at a small distance from the same, and communicating with an iron vessel of a globular form. In this last mentioned vessel, steam pipes, furnished with cocks are inserted, which conduct the steam into steam-receivers in the apartments, or into the liquids, &c. which it is wished to heat. Water is drawn into the Reservoir by the agency of steam which is made to enter it, and by expelling the air, and then being gradually condensed, creates a vacuum, and water is forced by the pressure of the atmosphere, from a barrel or other vessel, placed on a level with the boiler, &c. into the Reservoir.

The advantages which the inventor expects to derive from his machinery consist, 1. In an easy and convenient mode of heating steam to a high temperature, by its being exposed, after its formation, under a degree of pressure, which prevents its escape, to be further heated in the spiral tube before mentioned. 2. If steam of a high temperature is made use of for heating apartments, the vessels, which receive it may be a smaller size than in the mode practised in England. 3. By introducing into liquids, steam of a high temperature, they may be evaporated; but if steam, of merely a boiling heat, is introduced into water, its condensation produces more water than its caloric expels, and thus the quantity of water, which it is wished to evaporate is increased instead of being diminished.

Mr. Hoares' Address, published in this day's paper, will be perused with profit, and we presume with pleasure, by our agricultural readers. It exhibits condensation of thought, together with perspicuity of expression, not often united. We regret the necessity of postponing a part of it to our next; which became indispensable in consequence of some other articles, which could not well be divided, engrossing a larger portion of our columns than was anticipated.

FOREIGN.

London papers to the 6th Jan. have been received at New York, but their contents are not very interesting. The accounts from Paris are to the 3d. The Ettoile contains some strictures on the President's Message. It observes that "Mr. Monroe has taken in his Message the tone of a powerful monarch, whose armies and fleets are ready to go forth on the first signal. He does more; he prescribes to the Potentates of Europe the conduct they are to pursue in certain circumstances, if they do not wish to incur his displeasure. Such is the prohibition which he issues against their ever thinking of any new colonization in the two Americas." The Editor concludes by saying that "the opinions of Mr. Monroe are as yet merely the opinions of a private individual."

Portugal is distressed for money, and desponding at the loss of her South American Colonies. A forced Loan is in contemplation, and every imported article additionally taxed. A very serious conspiracy has been discovered at Lisbon just on the point of breaking out. Three Ministers had been dismissed, the *King* has ordered the *Queen* to be arrested, and many people of distinction were on trial. The people are in open rebellion.

An article dated Nurmberg, mentions that an important note had been delivered by Sir C. Bagot, English Ambassador at Petersburg, to Count Nesselrode, demanding explanation, as to the policy which Russia intended to adopt respecting South America.

Intelligence has been received in England of a dreadful inundation at a new settlement at the Cape of Good Hope.

Calcutta papers to the tenth of September have been received at New York. The cholera morbus was raging with great violence in many parts of India. Inundations in the Upper Provinces had done very great damage, particularly to Indigo. Tirhoot, considered one of the safest Indigo Districts in the country, has been completely ruined.

DOMESTIC.

The night of the 11th Inst. was signalized by a violent storm, which did immense damage in various parts of the country. Nearly all the bridges on Connecticut river were wholly or partially destroyed. Among the number were the Bridge between Northampton and Hadley, of which almost 300 feet were swept away.—The Bridge at Montague, opposite Greenfield, was nearly all swept away. The Bridges between Norwich and Hanover, Hartland and Lebanon, Windsor and Cornish, Springfield and Charlestown, Walpole and Westminster, Westmoreland and Chesterfield, were either wholly or in part swept away. The Bridge near Brattleborough, over the east branch of Connecticut river, about 100 rods from that over the main stream, was entirely swept away. The Bridge over the main stream received but little damage. Five Bridges on Williams river; several on the Ashuelot, three on Cold river, in Acworth, were likewise destroyed. The dam on the Connecticut, says the Greenfield paper, at the mouth of Miller's river, and the Locks at that place are almost wholly destroyed; the *Great Dam* connected with the Locks, below, which was rebuilt the last season, is materially injured. The *Great Dam* at South Hadley Falls is principally carried off.

In the neighborhood of Boston the tempest was very violent, but owing to the direction of the wind, and the tide being out, when it was highest, but little damage was done to the shipping. A leard twenty-four feet long was taken by the wind from a pile on Spear's wharf, and carried through the clapboards and boarding of the second story of a building occupied by Mr. Charles Appleton, sail maker, on Fort Hill Wharf, and broke a joint of five by three inches of the floor of the third story, by which its force was destroyed.—The pile is about 150 feet from the loft. Another board from the same pile was blown over the loft and lodged in the porch of the house of Mr. John Sargent, Branch Pilot, in Gibb's lane.

The Greenfield Herald states that the damage by the late freshet, on the Connecticut river, cannot be estimated at less than 100,000 dollars.

At Haverhill, during the late gale, the alarm was so great, that the inhabitants fled for refuge from their own dwellings to the meeting house; where, being collected, the terror was increased by several windows being blown in.

Republican Nomination.—His Excellency WILLIAM EUSTIS, for Governor; Hon. MARCUS MORTON, for Lieut. Governor.

"Affair of Honor."—A duel was recently fought, at the South, between two slaves—"All for law." The parties were without seconds, and, for the want of pistols, were armed with muskets. Upon the first fire one was killed on the spot, and the other wounded, it was supposed mortally. This was doing the business pretty effectually. The slaves seem determined to pluck up the drowning honor of duellists.

[Mass. Freeman.]

Mammoth Pig.—Messrs. Tracy and Sherman, of Norwich, have raised and fattened this season a pig, weighing as follows—alive 990 lbs. dressed 710 lbs.

Large Ox.—Mr. Thomas Borden, of Fall-River, killed an ox, last week, weighing *fifty* hundred and fifty pounds.

Drowning.—A daughter, and as we learn, an only child of Mr. Stephen Nash, living near Saugatuck ridge, Ct. about four years old, was hurled to death on Sunday afternoon last, in consequence of her clothes taking fire. She was alone in the house at the time.

CONGRESSIONAL.

SENATE.—Friday, Feb. 6. After attending to an al private business, the Senate in Committee, resumed the consideration of the bill to authorize the building of an additional number of Sloops of War.—The bill had been so altered as to provide for the building of the vessels so soon as suitable materials could be obtained, and the appropriation made \$25,000, instead of \$50,000. The bill this amended was offered by Mr. Barbour and Mr. Macon, and supported Messrs. Lloyd, of Mass. Hayne, of S. C. and Smith, of Maryland; when the consideration of the subject was postponed to Monday.

Monday, Feb. 9. The sums appropriated for building a Sloop of War having been fixed at \$250,000 for the present year; and \$200,000 annually for the three ensuing years, the bill, thus amended, passed to be engrossed. It afterwards passed the Senate, and was sent to the House.

Tuesday, Feb. 10. The annual report of the Sinking Fund was received and read.

The Senate in Committee proceeded to consider the bill to secure the accountability of public officers. After much discussion, and several proposals of amendment, the bill passed to be engrossed for a third reading.

Wednesday, Feb. 11. A statement of all the Personnel and Navy Agents, in arrears to the Government, received from the Treasury Department, and ordered to be printed.

The bill from the other house, authorizing surveys of the public lands, passed to a second reading, and was afterwards committed.

Thursday, Feb. 12. Statements of the Commerce and Navigation of the U. S. for 1823, were received, and ordered to be printed.

A resolution of the Legislature of Indiana, in favor of the revision of the Tariff for the purpose of encouraging domestic Manufactures was committed.

The bill to abolish imprisonment for debt, was taken up, discussed, and its further consideration postponed to Monday.

Motion of Mr. Lloyd, of Mass. the bill for extending the term of pensions to the widows and orphans of those slain, &c. on board private armed vessels, during the late war, was discussed in Committee, reported with amendments, and ordered to be engrossed.

Friday, Feb. 6. A bill laying a duty on all foreign merchandize at auction, was reported, read, and referred.

Mr. Abbot, of Georgia, in compliance with directions of the Legislature of that State, offered the following resolution:—

Resolved, &c. That the following amendment of the Constitution of the United States be proposed to the Legislatures of the several States, viz:—"That no person be elected or appointed to any office under the Constitution of the United States ought to be elected, or shall be construed to authorize the imposition or ingress of any person of color into any one of the United States contrary to the laws of such State." and referred as usual.

The House, in Committee, resumed the subject of Internal Improvements, and Messrs. Smith, Gazlay, and Livingston, of L. delivered their sentiments, in relation to the question was taken, before the House adjourned.

Monday, Feb. 9. A Memorial praying Congress to take the genuine Vaccine Matter throughout the U. S. to prevent preventive of small pox was committed.

Monday, Feb. 10. The bill on the subject of Internal Improvements was brought into consideration, and several motions for re-commitment, continuance.

A question on engrossing the bill for a third reading was taken and decided in the affirmative. Yeas 86.

Wednesday, Feb. 11, and Thursday Feb. 12, were

principally occupied in debates on the Tariff Revision Bill, but no decision was obtained.

MASSACHUSETTS LEGISLATURE.

IN SENATE.—Wednesday Feb. 11. A bill relating to Ex-Executors and Administrators was read a first time.

A Message was received from the Governor stating that he had received from the Governor of the State of Ohio a copy of certain resolutions, passed by the General Assembly of that State in January last, proposing that a system be adopted for the gradual emancipation of the people of color, held in servitude in the U. States; and recommending a plan of foreign colonization for their improvement, and eventual deliverance from slavery, with a request that said resolution be laid before the Legislature of this State.

Thursday, Feb. 12. Hon. Messrs. Allen, Hubbard, Willard, Kutter and Hastings were appointed a Joint Committee to report what further measures were necessary to effect the adjustment of the claims of this Commonwealth on the U. States for military services, &c.

The Hon. Messrs. Keyes, Hubbard and Mills were appointed a Committee to report on the expediency of empowering Courts to require parties to produce evidence in their possession pertinent to the issue pending between them.

Saturday, Feb. 14. A resolve authorizing Harvard University, Williams College, and the Berkshire Medical Institution, to bring in Bills, was reported, accepted, and sent to the House for concurrence.

A bill relating to the Reversionary interest of Charles River Bridge, was read a second time, and laid on the table.

Monday, Feb. 16. The bill relating to Charles River Bridge; and the bill to incorporate the Middlesex Bridge Proprietors are referred to the next session.

A bill to prevent fraud in the admeasurement of Grain, Salt and Meal passed to be engrossed.

Tuesday, Feb. 17. The Joint Committees on the resolutions of Tennessee and Alabama, reported, that it was inexpedient to express any opinion on the formation of a Convention of Members of Congress to nominate candidates for President, &c.

A Message was received from the Governor, relative to the claim of the Commonwealth now pending with the Government of the U. S. and stating the necessity of making further appropriations to defray the expenses necessary for continuing the prosecution of that claim.

House.—Wednesday, Feb. 11. Among the bills enacted of general interest, were a bill to repeal the act to restrain the issuing of certain printed promissory notes;—a bill in addition to the act making further provision in the Judicial Department. The additional bill relating to the appointment of Inspectors, and regulating the manufacture of Gunpowder, passed to be engrossed. The bill to alter the law providing for the instruction of Youth, as originally reported, was read a third time, and laid on the table. The bill further to regulate the Militia passed to be engrossed. A bill for the better regulation of Goals and the prisoners therein was read once. A bill respecting the admeasurement of Grain was amended, and laid on the table.

Messrs. McKay, Hewins, Crowell, Hale, and Carey were appointed a Committee to enquire into the expediency of amending the 13th article of the first Section of the 2d chapter of the Constitution so as to authorize the Legislature to decrease as well as increase the amount of salaries for the Justices of the Supreme Judicial Court.

A bill was reported relating to the Reversionary interest of the Commonwealth in the Bridges in the vicinity of Boston, proposing to grant to the Proprietors of Charles River Bridge a perpetual right in the same on certain conditions.

Thursday, Feb. 12. A resolve, granting \$1500 for the use of the States Prison was read the first time, and has since passed both Houses.

A bill to prevent the wanton destruction of lamps in streets and on bridges was read twice.

Messrs. Ellis, Gray and Jackson were appointed a Committee to report on the expediency of repealing the law requiring in certain cases that the bodies of persons, who commit suicide shall be interred in the Highway.

The bill to alter and amend the act providing for the instruction of Youth passed to be engrossed in concurrence.

Friday, Feb. 13. A committee was appointed to re-

port on the expediency of amending a law regulating the practice of Physic and Surgery.

The Militia Bill was further amended so as to exempt uniformed, non-commissioned officers and privates of the militia from the poll tax.

Saturday, Feb. 14. The bill respecting Highway was indefinitely postponed.

The Judges and Registers of Probate salary bill passed to be engrossed.

Monday, Feb. 16. The Report of the Joint Committee, giving leave to Harvard University, Williams College, and the Berkshire Medical Institution, to bring in bills for the benefit of those Institutions, came down from the Senate for concurrence. The House non-concurred in the parts of the report, which relate to the University and the College, and concurred in giving leave to the Berkshire Medical Institution to bring in a bill.

First volume of the New England Farmer wanted.—A few complete copies of the first volume of the New England Farmer would be gladly received at this Office in exchange for complete copies of the 2d vol. of the same publication. Also, No. 42, of the first volume is much wanted to complete a file, and a generous price will be given for that number, by the publisher of this paper.

FOR sale at this office a few pounds of *Mangel Wurzel Seed*, raised by John Prince, Esq., Roxbury. Feb. 21.

NIGHT.—BY MONTGOMERY.

Night is the time for rest;
How sweet when labors close;
To gather round our aching breast
The curtain of repose;
Stretch the tired limbs, and lay the head
Upon our own delightful bed!

Night is the time for dreams;
The gay romance of life,
When truth that is, and truth that seems,
Blend in fantastic strife;
Ah! visions less beguiling far
Than waking dreams by day-light are.

Night is the time for toil;
To plough the classic field,
Intent to find the buried spoil
Its wealthy furrows yield;
Till all is ours that sages taught,
That poets sang, or heroes wrought.

Night is the time to weep;
To wet with unseem tears
Those graves of memory, where sleep
The joys of other years;
Hopes that were angels in their birth,
But perished young like things of earth!

Night is the time to watch;
On ocean's dark expanse,
To hail the Pleiades, or catch
The full moon's earliest glance,¹
And brings into the home-sick mind
All we loved and left behind.

Night is the time for care;
Brooding on hours misspent,
To see the Spectre of despair
Come to our lonely tent;
Like Brutus nist his slumbering host,
Startled by Cæsar's stalworth ghost.

Night is the time to muse;
Then from the eye the soul
Takes flight, and with expanding views
Beyond the starry pole,
Descries athwart the abyss of night
The dawn of uncreated light.

Night is the time to pray;
Our Saviour oft withdrew
To desert mountains far away,
So will his followers do;
Steal from the throng to haunts untrod,
And hold communion there with God.

Night is the time for death;
When all around is peace,
Calonly to yield the weary breath,
From sin and suffering cease;
Think of Heaven's bliss, and give the sign
To parting friends—such death be mine!

MISCELLANY.

FAINTING.

Nothing alarms by-standers so much as seeing a person faint away. This fainting arises from fright, loss of blood, or pains, and however unpleasant it is, is rather an antidote or a cure, than a disease: for under fainting, there is a suspension of every faculty: during it the bleeding ceases, the pain is not felt, or the object which caused the fright forgotten or removed. It is very seldom dangerous; and more harm has

arisen from improper modes to remove it, than from the fainting itself. Let the person be laid in a horizontal position, and pressure of every sort removed. Such as stays, neckcloth, &c.: if a man, let the shirt collar be unbuttoned, and nothing tight remain about the knees or arms. Stimulants are generally applied to the nose; and fortunately do no harm, because the person is insensible to their influence. If in a room, let the windows be opened to cool the surrounding air, for if it be heated, even that stimulus is too great; for the same reason it is improper for persons to stand in a crowd around one who has fainted, and who wants all the fresh and cool air that can be admitted to him. Never shake the body with a view to raise the vital spark lest you darken it forever.

Many persons from extreme sensibility are apt to faint when they see any one in distress, or witness any alarming accidents: and hence, instead of being of any use, they add to the general confusion. This state of mind, as it is much to be lamented, so it ought to be guarded against with the utmost care. It depends, in some measure no doubt, on bodily constitution: but since we know it may be increased by indulgence, why should it not be checked, or perhaps cured, by good sense and resolution? It will be worth while to try; and for the encouragement of my readers, I can assure them, that many persons, who were formerly so timid as to run away from the sight of a little blood, and be greatly alarmed at a shriek, have so far overcome this weakness, as to render themselves highly useful on many similar occasions. It is certainly right to sympathize with our fellow creatures in their distress but that degree of sympathy is best which while it teaches us to pity, prompts us to relieve and assist them.

Something Remarkable.—A wild Swan or Cygnet, was shot on Saturday last, at the west end of this Island, by Wm. Bennett. Such an occurrence, in the middle of January, we believe is wholly unprecedented in the sporting annals of this quarter of our country. This beautiful and extraordinary bird was discovered several days since, entirely unaccompanied by any of its species, at the opposite point of the Island, about 12 miles eastward of the place where he was killed. Its plumage is singularly compact and delicate. The body, wings and neck, are of the purest white—the feet and bill black. Length, from the tip of the bill to the feet, 5 feet and 8 inches. Distance between the extremities of the wings when extended, seven feet. Weight, about 21 pounds.—*Nantucket Inquirer.*

ANECDOTES.

Col. Francis Edgeworth, an ancestor of the late Mr. R. L. Edgeworth, was a man of great wit and gaiety, fond of his profession, quite a soldier, and totally regardless of money. Besides being straitened in his circumstances, by having for many years a large jointure to pay to his mother, he was involved in difficulties by his taste for play—a taste which, from indulgence, became an irresistible passion. One night, after having lost all the money he could command, he staked his wife's diamond ear-rings, and went into an adjoining room, where she was sitting in company, to ask her to lend them to him. She took them from her ears and gave them to

him, saying that she knew for what purpose he wanted them, and that he was welcome to them. They were played for, and the Colonel was fortunate, as to win back all that he had lost that night. In the warmth of his gratitude to his wife, he, at her desire, took an oath never more to play at any game with cards or dice. Some time afterwards, he was found in a hay-rick with a friend, drawing straws out of a hay-rick and betting upon which should be the longest.

A hard Master.—A rich man whose head was not so well filled as his purse, hired a band of musicians to perform for an evening to entertain some company, which he had invited. When they were performing an overture the master of the feast went up to the harp-player and asked why they were not playing? The harp-player said they had twenty bars rest. "Rest!" said he, "I will have nobody rest in my employment! I pay you for playing not for resting."

A man who wanted employment as a schoolmaster was asked if he was acquainted with mathematics. The would-be schoolmaster, supposing some great literary character was meaning to employ him, replied, "Matthew Mattocks, sir? No, sir, I am not acquainted with Matthew, but I know his brother Richard very well."

A bad character better than none.—"Sir" served a publican of Doncaster, to a man noted for never speaking the truth, "you have taken away my character." "How so?" said the other, "I never mentioned your name in life." "No matter for that," replied the publican, "before you came here, I was reckoned the greatest liar in the place."

NEW AND VALUABLE IMPROVEMENT.

JUST received, and for sale at the Agricultural Establishment, No. 20, Merchants' Row, Willis's, the approved patent Straw Cutter; for simplicity, and despatch in cutting straw, hay, &c. far exceeding any now in use.—Likewise, Safford's Improved Straw Cutter; with a variety of common Hand Machines for the same purpose.—Also, W. James' improved Corn Sheller, a very valuable and simple Machine. Jan. 31.

BRISTOL CROWN GLASS.

150 BOXES Bristol Crown Window Glass, of superior quality, just received and for sale wholesale and retail, at the very lowest prices, by ERIGHAM & DELANO, No. 30, Union-st.

WANTED to purchase twenty or thirty full boxes of Merino Wools. Address, or apply to DAWSON, Broker, Exchange Street, Boston. Feb.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at discretion of the publisher,) until arrearages are paid.

[Continued from page 225.]

PEACH TREES.

3. There are, no doubt, many ways by which each tree may be in a degree if not entirely freed from the worms, which devour their roots. I respect the utility of ashes, my experience testifies me in speaking with a considerable degree of confidence. There is now standing on my Father's premises, a peach tree, bearing fruit that is called, familiarly, the late Rare-Ripe; fruit, by the way, much less known and cultivated, than for its worth it ought to be, certainly more than fifty years old, and which now grows tolerably well; the root always having remained in a great degree sound, and successfully sending up shoots to supply those that decayed through age. Digging round this tree, which has usually been done every year in the spring, I have often taken a quantity of gum, which would surprise one, who had no experience in the thing; and which, had it not been removed, would have afforded shelter to a great number of worms, to prey upon the bark, and then upon the wood of the tree. After removing the gum, the practice has been to put a quantity of ashes round the tree, say a peck or more, and then cover it over with fresh earth. In this way this tree has been preserved, existing through half a century, with scarce a failure, a rich abundance of very pleasant fruit, and now bids fair to continue thrifty for many years to come. I might mention others of a similar age, which would also serve as evidence of the utility of this practice. But this will, perhaps, be enough to induce those who love to try the experiment. The labor is small, and the expense next to nothing. I would here mention one thing, suggested by my own observation. I do it to be informed whether it is confirmed by the experience of others. And this is, that fruit trees, including the varieties generally known by that name, may be preserved till they are about fifteen or sixteen years old, are much less liable to serious accidents after that than before.—After they have arrived to that age, may be expected, with a considerable degree of confidence, to live and produce fruit for many years.

OBSERVATIONS BY THE EDITOR.—We believe the foregoing remarks will prove useful, especially on account of the information which they contain, but by turning the attention of cultivators to a disorder in peach trees, which is not uncommon, seems not to be generally understood. The following extract from an article in the last edition of Dr. Willch's Domestic Encyclopedia, (which was written, we believe, by Dr. Mease, of Philadelphia) describes the disease to which we allude.

"Peach trees are liable to three casualties: 1. The fly that deposits eggs near the root, where forms a worm. 2. The bursting of the bark by severe frosts in wet winters.

3. The splitting of the limbs at the fork of the tree.

"The fly which is blue, (but not a wasp,) begins its attack about the middle of July, and continues its depredations until the middle of September. It wounds the tender part of the bark, and generally at the surface of the ground, there depositing eggs, which hatch into worms, that prey upon the mucilage, and tender part of the bark, until the communication between the root and the branches is cut off, causing the death of the tree. To guard against this, raise a little hillock in the month of June, round the tree, about a foot high, so as completely to cover that part of the bark kept moist and tender at the surface of the ground. This hillock will not stand so long at one height, as to tender the bark above, as the rain will gradually wash it down level with the surface, and must be raised again every summer.

"To take out the worm, the roots must be uncovered, and the spot looked for where the gum oozes out, following the cavity round with the point of a knife, until you come to the solid wood, and lay the whole open: the worm will be found with a white body and black head; which must be destroyed, and the holes carefully filled up with cow manure, rendered adhesive with sand or lime and ashes, as directed by Forsyth.

"Soap suds, heated after a family wash, and poured on the roots of the trees, about the middle of August, have been used with success in destroying the eggs or the young worm.

"According to Mr. Ellis, of New Jersey, the injury arising from the worm may be prevented in the following way:

"In the spring, when the blossoms are out, clear away the dirt so as to expose the root of the tree, to the depth of three inches; surround the tree with straw about three feet long, applied lengthwise, so that it may have a covering, one inch thick, which extends to the bottom of the hole, the butt end of the straw resting upon the ground at the bottom;—bind this straw round the tree with three bands, one near the top, one at the middle, and the third at the surface of the earth; then fill up the hole at the root with earth, and press it closely round the straw. When the white frosts appear, the straw should be removed, and the tree remain uncovered till the blossoms put out in the spring.

"By this process, the fly is prevented from depositing its egg within three feet of the root, and although it may place the egg above that distance, the worm travels so slow that it cannot reach the ground before frost, and therefore it is killed before it is able to injure the tree.

"The truth of the principle is proved by the following fact. I practised this method with a large number of peach trees, and they flourished remarkably well, without any appearance of injury from the worm, for several years, when I was induced to discontinue the straw with about twenty of them. All those which are without the straw have declined, while the others, which have had the straw continue as vigorous as ever."—Thus far Mr. E.

"To guard against frost, plant the trees where the water will run off, and procure the sweetest and richest fruit, as the inferior qualities are more injured by cold.

"The splitting of the tree at the forks is guarded against by preserving as many upright branches as can be spared, by breaking off in bearing years, more than half the quantity of fruit while small, and by pruning almost the whole of every branch beyond where the fruit is set, leaving only a few buds on each of the succeeding year's fruit. The size of the fruit are by those means rendered larger, more beautiful, and of a higher flavor, and the growth of the tree is rendered more vigorous."

The worm above described is, we believe, the same which is sometimes called the Borer, which we have heretofore mentioned, and given directions for destroying, and guarding against the mischief it occasions.* We think it probable that the quantity of gum, mentioned by our correspondent is the effect of injury previously suffered by the tree, in consequence of the punctures of this insect; and that instead of affording "shelter to worms" it merely indicates the holes which they have bored, and points to the places in which they are harbored. The reasons of our belief are founded on the following among other facts, which go to corroborate those, which have been already stated in this article.

The Massachusetts Agricultural Repository, vol. v. p. 350, &c. contains much useful information on this subject, of which we will give a sketch. John Prince, Esq. states that he had lost a number of apple trees, and supposed the cause to be "a small, white, ringed worm, about three quarters of an inch long, with a dark colored head, (I believe the same that attacks the peach tree,) attacking them at and just below the surface of the ground." They were got rid of "by digging round the trees, and clearing away the earth to the roots; and then, with a sharp pointed knife, a chisel, or gonge, (and a small wire to probe, if they are deep in the tree) they were easily destroyed. After taking out all that could be found, the wounds were covered over with grafting clay, and a large proportion of dry wood ashes mixed, and the earth then returned to the tree." "One capable man will dig round and turn the sods, two or three feet from the tree, (and which is also extremely beneficial to young trees in grass ground,) and examine at least thirty trees in one day; and in garden, or ploughed ground, one hundred.

A Committee appointed to examine this subject, consisting of Samuel G. Perkins, Esq. and John Prince, Esq. observe that "the seasons when this operation, [of destroying those insects] is performed with most effect are the spring and fall; and if in the spring, before the month of June, as the perfect insects escape before that time. In apple and mountain ash trees, the existence of the animal in the tree may generally be known by the mossy appearance on the bark, and it may be traced by removing a little earth from

* See N. E. Farmer, vol. i, page 317.

the body of the tree, next above the insertion of the great roots. Although the hole at which the insect enters, is, in many instances, very small, yet it is easily discoverable by an appearance of powdered wood, or fine-saw dust, which is thrown out by the worm;—here you may introduce your chisel, and follow his track. Cut the bark smooth, and when you have cleansed the tree of all insects, (of which there are sometimes as many as twenty to be found,) plaster the wounds over with a little clay, and when it is dry, restore the earth to its place. The operation should be renewed the succeeding season to make the work complete. In peach trees the insect is traced by the gum; but as this is also produced by bruises, it is not infallible.

"Note.—If the frost be out of the ground, we recommend to farmers to perform the spring cleansing as early as March and April."

Dr. Thacher in recommending modes of preventing the damage occasioned by this destroyer, says, "Early in the spring let the soil from around the trunk of the tree be removed down to the roots, and fill up the vacant place with some substance that would prove obnoxious to the fly or worm, or that would infallibly resist its powers to penetrate the bark. Among the substances which appear most likely to prove successful, I will mention flax rubbish and sea weed. The next which occur, are ashes, lime, sea-shells, sea-sand, mortar rubbish from old buildings, clay, tanner's bark, fragments of leather from the tanners and shoemakers' shops, &c. Some, and perhaps any of the above-mentioned substances if pressed closely round the trunk of the tree, must inevitably prevent the fly or worm from having access to the bark, and of course prove an effectual remedy."

The following composition is recommended by Dr. Thacher and other authors who have written on this branch of husbandry.

"Take equal parts of quick lime, cow dung and clay, which by the addition of soap suds and urine, should be reduced to the consistence of common paint. To make it more adhesive add a little hair. Let the whole stem from the roots to the branches, be enveloped with a coating of this composition, and occasionally repeated, and it will scarcely be possible for the fly, or worm, or insects, to injure the trunk of the tree; and it will at the same time prove conducive to its health and vigor. It might even be recommended to make the application to all young trees, at the time of transplanting, especially when the worm is known to prevail."

The fact stated by our correspondent that fruit trees which have arrived at fifteen or sixteen years of age, are less liable to diseases than before that period, may perhaps be accounted for from the bark's becoming stronger, more rough, and less penetrable by insects than in the earlier stages of the growth of the tree. This insect does not confine its depredations to apple and peach trees, but extends them to mountain ash and quince trees, and, if we mistake not, plum trees sometimes suffer by the same destroyer.

FOR THE NEW ENGLAND FARMER.

Mr. FESSENDEN,—If you think the following worthy a place in your paper, it is at your service.

Method of raising Beets, of any shape you wish.
—After your beds are made ready to sow, have

a mould of the desired form and size, which press into the ground, then fill the hole with rich compost, and drop one or two seeds, in the centre, the beets when full grown will be of the exact shape of the mould, and very smooth.

I have never had ocular demonstration of the above method, but had it from a man of veracity and truth a few days since, who says he has practised it with complete success for several years. Yours, &c. L.

FOR THE NEW ENGLAND FARMER.

Mr. EDITOR,—In the Address, delivered before the Worcester Agricultural Society, by Dr. Fiske, and published in your paper, much useful matter is contained, many excellent ideas are suggested, and as a whole it must be considered interesting and valuable.

But notwithstanding the high estimation in which the Doctor is held by the community as an agriculturist and a man of science, it is questionable whether his ideas are all of them correct.

In his Address he recommends setting out and cultivating ornamental trees, along the sides of the highway, &c. and intimates that himself takes a degree of satisfaction in reflecting on a transaction of this kind in which he was engaged forty years ago. I know that a street or an highway adorned with lofty trees on its sides, makes a handsome appearance and is truly pleasant during the summer season when their cooling shade is so agreeable and refreshing;—but for one I am satisfied from observation and experiment, that most kinds of ornamental trees, wherever they stand, have an unfavorable influence on the ground in their immediate vicinity, at least so far as their shade may extend. Very little of any thing will grow under or near them, and that generally of an inferior size and quality, indicating that the land is either poisoned by the destructive influence of the tree, or deprived of the warming rays of the sun and moistening showers of rain.

About thirty years ago a row of trees about sixty rods in length, consisting principally of elm and ball wood or button wood, were set out on each side of the road which passes through the farm on which I live. The most of them grew rapidly and became large and splendid, so that the passing traveller was frequently heard to remark respecting their lofty and beautiful appearance. But at length they became so pestiferous and evidently injurious to the land near by them, that I determined on cutting them down, and have since executed my determination. I have taken the same course with the scattering trees on the farm, cutting them down, reserving only here and there one merely to accommodate my cattle in hot weather.

I am determined in future to set out and cultivate none but fruit trees.—Instead of the poplar and elm and other useless shrubs about my dwelling, I prefer the English cherry and pear, as these not only afford a cooling shade during the warm season, but produce a rich supply of excellent fruit.

One of my neighbors, fifteen years ago, procured and set out a dozen English cherry trees around his house;—these with a little care and attention grew and flourished, and for several years have produced fruit abundantly, and their handsome appearance is admired by every beholder.

Another of my neighbors, nearly at the same time, set a row of poplars in front and at each end of his house. These also flourished and so became tall and large. In the course of ten twelve years my neighbor began to apprehend and soon became satisfied that his poplars were not only useless but a perfect nuisance.

His garden was evidently suffering a material injury from them. Sprouts were everywhere shooting up from the wide spreading roots; very little of any thing would grow near them, and besides all this they were like the barren fig-tree producing nothing but leaves.

Two years ago my neighbor cut them down and supplied their places with some valuable fruit trees, which probably in a few years will be both ornamental and profitable.

Now I would suggest the idea whether would not be better, and tend more to a general improvement to pay more attention to the propagation of fruit trees, and less to the cultivation of those which are not only unfruitful but evidently destructive and injurious to the growth of every kind of vegetation that may happen to be near them. A FARMER
Worcester, Feb. 1821.

From the Massachusetts Agricultural Repository

West Bridgewater, November 7. 1822

John Lovell, Esq. Corresponding Sec'y of Mass. Agricultural Society.

SIR,—On the 28th April last, I employed a man in grafting a young orchard, situated on the margin of a river near my residence. The soil is of an excellent quality, and well adapted to the growth and sustentation of fruit trees, and the situation, in other respects, very eligible for the purpose to which it is applied.

Among the number of trees which were thus grafted, was one (and there was not in the orchard, previous to this time, as was sufficiently indicated by the broad dark leaf, and the smooth shining, and almost transparent bark, another more healthy and flourishing condition) having only two branches sufficiently large for grafting, and which, being severed from the parent trunk, left it entirely destitute of leaf and limb: not even a twig or sucker was visible about it. Four handsome scions were inserted in the stocks, and the usual precautions taken to preserve them their position, and cure them from violence.

After the operation of grafting had been completed, I continued, daily, to visit the orchard, watching, with minute attention, the progress of the sap as it made its way into the new inserted scions. My repeated visits enabled me to make, in course of the season, the following observations.

1st. That the scions set in the trees in which the tops were not entirely taken off by grafting, put forth much sooner, than those the tree here particularly noticed.

2d. That these last did, at length, put forth and look thrifty and promising.

3d. That they soon however began to languish on a sickly hue, fell into a state of general decay, and before the commencement of the present month, I found both stock and scions entirely dead.

I have since carefully examined the tree in question, low the surface of the ground, to ascertain whether its death was not occasioned by the

of some destructive insect; but could nothing to justify such conclusion. The ink still remains whole and entire, without least appearance of any bruise or incision made in it. To what then can its premature death be attributed? to the taking off of the ink in the manner, and circumstances, in which was done in grafting? If this be the case, I have scarcely a remaining doubt on the subject; it is a fact certainly of importance; and of which farmers generally ought to be apprised. I am, sir, very respectfully, your obt. servant.

JOHN E. HOWARD.

From the Philadelphia American Daily Advertiser.

FATTING SWINE.

Belmont, Dec. 10, 1823.

MR. POUTSON.—Several of my neighbors have recently suffered heavy losses, by diseases fatal to fattening swine: when preventive precautions have not been taken. With the view to avert such fortunes, when I farmed, on an extensive scale previously to and since the revolutionary war, I tried many experiments in precautionary measures, as well as in cures. I most frequently failed in the latter; but at length I adverted to my having been informed of a simple preventive, which I can confidently declare, has, in my hands, always succeeded. That I might be more fully acquainted with the subject, I made an inquiry of an old farming laborer, who was yet in my employ, and who had the charge of fattening my hogs, in pens, during a large portion of the time since the close of that war. He recollects the loss of one hog only, and that by improper feeding. I deem it incumbent on me to re-publish, under a hope that the subject of it may be as beneficial to others as it has been to me, part of a note to a communication I made to *The Philadelphia Society for Promoting Agriculture*, March 8th, 1808; see *Annals of the Society*—page 229.

But sour food is the most grateful and alluring to swine. One gallon of sour wash, is further than two of sweet. I mean the wash as acidulated to the degree required for dissection—not aceticus.

RY ROTTEN WOOD should be constantly in the pens, that the hogs when confined for fattening may eat it at pleasure. Nature points out the absorbent, (or whatever it may be,) as a remedy, or preventive. They will leave their pens to devour the rotten wood, when they require it. I have not lost a fattening hog for more than 20 years, when I used it, but have suffered by neglecting it. Some of my neighbors, with frequent losses of fattening hogs till I showed them of my practice; of which I was told by a woman from East Jersey, before our revolutionary war. She said it was then common, and practised there."

I add my experience since the foregoing was published; which has been uniformly similar. In the 2d volume, page 32, near the close of a very valuable communication from Mr. Deane, of Northumberland, in our state; who has great numbers of Swine, prepared at the wash from a large distillery, and finally mixed with Indian corn: the following important information will be found. The whole communication is worthy the perusal of every farmer.

RY ROTTEN WOOD is a good thing; but I will

take the liberty to mention what I think a better; we have three blacksmiths in this town; and my hogs eat up all the ashes or cinders they make; we haul it into the pens by cart loads, and the hogs will, as you observe by the *Rotten Wood*—devour this at times with more avidity than their ordinary food."

The carbonated cinders contain some of the ingredients of rotten wood; and perhaps in greater proportions. Be this as it may, every farmer can readily obtain the latter; and many can procure the former. It is anxiously desirable that a preventive so efficacious as either has been found to be, may not be unwisely and fatally overlooked and neglected. Nothing in human art is invariably infallible; but the experiment is so easy and cheap that the most incredulous should be induced to give it a fair trial. Clean elevated sties or pens, dry litter and a small enclosure, adjacent to the pens, for air and exercise, and a moderate, but constant supply of salt, no doubt add to the efficacy of the preventive.—The diseases I have seldom known to be cured. The most formidable of them are sudden, violent, and rapidly fatal, never allowing time for remedies. Their victims are unexpectedly (for gradual approaches are unperceived,) attacked with the last paroxysms, before their danger is decisively known.

Pigs and sheep are subject to sudden and incurable maladies.

Preventives are, therefore, of the first importance. Professed cures are too often, mere quackeries in relation to both these estimable parts of our stock.

RICHARD PETERS.

Note.—It is said that Charcoal will answer the same purpose for fattening hogs that is effected by *Blacksmith's Cinders or Dry Rotten Wood*. See N. E. Farmer, vol. i. pages 144, 206.

From the National Agis.

AGRICULTURAL.

MR. ROGERS.—Having leisure, I feel disposed to make a few remarks, on the culture and management of Clover; which, if you think worthy, you will please to lay before the public, by an insertion in your paper.

I am induced to make the following remarks, by a practice which prevails with many farmers of my acquaintance; that of not sowing Clover seed, when seeding down tillage land to grass. This practice, I hold, to be at variance with the farmer's best interest. They say, Clover is a poor kind of hay, and besides, there is enough already, in my land to prevent the growth of any thing else, the first season, at least;—but does it thence follow, that it is best not to sow? I think otherwise, I admit, that it may sometimes be the case, when land is very rich, whether sowed or not. But it is well known to all who have paid due attention to the subject, that Clover which is not sown, or which may spring up spontaneously, will not remain in the land, or continue to vegetate, more than half as long as that which is sown, and that it is not generally so luxuriant and productive. And I believe most farmers will admit that the root must bear a just proportion to the branch, thence the greater the root, the greater the advantage to the soil, when decayed or pulverized. It is a truth that land seeded with Clover and Timothy, or Foxtail, at the same time, will

produce about as much Timothy, after the Clover fails, as it would in the same number of years, if seeded with Timothy only, at first. The Clover roots, greatly tend to enrich and pulverize the soil, while those of Timothy bind and impoverish it. To ascertain the truth of this statement, let a farmer take two pieces of land, equal in size and cultivation, and appropriate one to Clover, and the other to Timothy, the term of three years, then let each be succeeded by a Corn crop, with equal management, and the produce of each piece, will furnish a criterion, by which the strength and quality of soil, will be readily determined. I do not pretend that Clover is equal in quality with Timothy for hay, but I believe it to be much better for feed in summer, and that when sowed with, or about the time of sowing spring grain, which I hold to be the best time for sowing both; the clover will produce feed, after the harvest of the grain, the same season, sufficient to pay for the seed, while the Timothy will produce little or none.

I am far from admitting that Clover is not valuable for hay; much, however, depends on the time of cutting, and the manner of curing it.

If it be permitted to stand, or rather remain in the field until it is beaten down, and the leaves are gone three fourths of the length of the stalk, it is of little value, compared with what it might be, by different management.

The best method to prevent its growing too rank, is to sow it thick; many suffer great loss from the want of proper feeding: by endeavoring to save the price of a pound of seed they lose dollars in the worth of the first crop, and in short, are emphatically, 'penny wise, and pound foolish,' in the outset.

If Clover be permitted to stand until it becomes large, it ought not to be dried till the leaves crumble off, but carried in quite green, and cured with salt.

I am, however, of opinion the better way is, to cut it two or three times, during the season, before the winds and rains beat it down; it may then be dried sufficiently to save itself, and makes excellent hay.

A FRIEND TO AGRICULTURE.

While a young gentleman was gunning on Saturday last, on the beach at the mouth of East Chester, Bay, about 14 miles from this city, he discovered something on the water, which he found to be some marine animal, upon which he pursued it for several hours, and at last, as the animal approached the shore and extended its jaws, presenting a frightful appearance to one unaccustomed to view the monsters of the deep, he discharged his piece directly in its mouth; upon which it bellowed most tremendously, and became so furious that it attacked and beat off the gunner's dog who had sprung towards the animal the moment it was fired at. The gunner repeated his fire, and the third shot proved mortal. It has since been brought to this city, and proves to be a *Sea Elephant*, weighing upwards of 600 pounds, and measuring about nine feet in length. This animal is rarely seen in northern latitudes.

N. Y. Mer. Adv.

Wool.—We understand the importation of wool from foreign places, into Boston, during the year 1823, was 733,146 pounds—cost, \$95,649.

An Address to the Essex Agricultural Society, in Massachusetts, at Topsfield, Oct. 6, 1823. By Frederick Howes, Esq.

[Concluded from page 235.]

In the article of fruit trees, we have a great superiority over the English farmer, the most valuable fruits, as apples, pears, plums, are produced here with much greater ease, and in far greater abundance.

In the cheapness of labor the English farmer may have some advantage over those American farmers who hire a considerable portion of the labor on their farms.

Mineral manures as lime and marle are probably obtained with greater facility in England. Those parts of the United States where gypsum is used with success, have an advantage over England. This however is not the case with us.

The taxes to which farmers in England, are subjected, are far heavier than are known here, and would be thought by us intolerable, and such I trust as will never be attempted. Tithes and poor rates in England fall wholly on real estate, and are estimated to amount to ten shillings sterling an acre, on all the cultivated land in England, that is more than two dollars an acre, so that the English farmer in addition to his rent and taxes on a farm of two hundred acres, is compelled to pay about four hundred dollars for tithes and poor rates. Taxes on the necessities of life, on leather, soap, beer, salt, and on almost every article of consumption, foreign or domestic, increase the burdens of agriculture. In addition to these, there are regulations which promote the interest of the manufacturer at the expense of the farmer, as the prohibition to export wool, though it would often command a much higher price on the Continent than in England, and the prohibition to import many commodities from abroad, in order to give their own manufacturers a monopoly of the market.

The activity, enterprize and skill of the English farmers have triumphed over all those difficulties, and carried the art to a higher degree of perfection than any other nation: They have been much aided by a liberal expenditure of capital, and by the discoveries and improvements in science and the useful arts.

On a fair comparison of the advantages and disadvantages of the English and American Farmer, I do not think the result will be found against us. We have as great encouragement to improve our lands, and render them more productive as the farmer in England, or any part of Europe. We have many of the same facilities for the cultivation of the soil, and some that are peculiar to ourselves. We are free from some very heavy burdens to which the English farmer is subject, and if agriculture is not improved in a high degree, the cause is not in our soil, climate, or political institutions; it must be sought elsewhere.

In some parts of the United States, the climate may be milder, the soil more fertile, and cultivated with less labor, more favorable to the production of grain, or have the advantage of some great staple, as cotton, rice, or tobacco. But if we consider the general salubrity of our climate, the numberless springs and streams which afford such an abundance of water to every part of New England, the goodness of our roads,

the advantages of our markets, the fertility of a considerable portion of our soil, the facilities for enriching it, we shall have no reason to covet the more fertile plains of the south.

If we reflect on our institutions of every kind, especially our parishes and public schools, which have existed from the first settlement of our country, and have diffused the benefits of intellectual, moral, and religious instruction through every town and village of New England, and have contributed so essentially to form that character of industry, activity, enterprize, intelligence, and those correct moral habits, for which her inhabitants have ever been distinguished, and which are not less necessary to individual and social happiness, than to national prosperity, we shall pause before we quit the soil of our ancestors for an imaginary paradise in the south or the west.

In order to prosecute agricultural improvements with success, theory and experience, science and practice must be united. We must avail ourselves of the discoveries in science, and the inventions and improvements in the arts.—No employment has a more intimate connexion with the most important sciences, and the most useful arts, and there is none which admits of a greater variety of interesting experiments. In some countries of Europe, the study of agriculture is an essential part of a liberal education. Several distinguished Universities have a professorship to teach both the theory and practice of agriculture. In the countries where it has been most successfully cultivated, it is one of the most popular employments, and most interesting subjects of conversation, among men of the highest rank and attainments. The most distinguished chemist in England delivered a course of Lectures annually for many years, on this subject before the Agricultural Society.—Indeed no art so well deserves the national patronage, as none is so essential to national security, prosperity and power. No employment is on the whole so favorable to good morals, social order, and to the promotion of those objects in which the true interest of a nation consists. It is not expected that all farmers should be philosophers, or men of science, but it is desirable that they should have some knowledge of those sciences and arts which have a close connexion with the cultivation of the soil, and have contributed so much to its improvement. Such an acquaintance with chemistry, mineralogy and botany, as would render a man able to analyze the different soils and ascertain their constituent parts, and the nature and properties of the plants commonly met with, might often be highly beneficial. Wealthy farmers might give their sons an opportunity of acquiring this knowledge without any sensible inconvenience, and thus at once promote the welfare of their families, and advance the interest of their country.

From the Old Colony Memorial.

The means of increasing or preserving the fertility of the soil on which he operates, ought to be a primary object with every farmer, otherwise continual cropping will exhaust not only his soil, and his strength, but his means.

"Lime has caused to start into life the most inert and sterile soils of Great Britain."* If

this article can be substituted for, or brought in aid of manure (to all farmers so difficult of acquisition) or can be found to answer in this section of the country, the same purpose as Gypsum does in others, our agriculturalists would hail it as a new era in their pursuits.

It is not left for us to make the experiment of its efficacy; to obtain the result of which the life of man is hardly equal; it has long been made, and is in familiar use among farmers of our mother country, and they have reaped unbounded advantages from the use of it. It only remains for us to come boldly to the application of their experience to our soil, and in that situation, to ascertain its effects here; should prove beneficial we may reap the advantage without groping our way by little and little as they must have done.

It is said to be useful when applied to any, to all soils; when mixed with a sandy soil, there renders it more adhesive, and increases its capacity for retaining moisture—when applied to a stiff clay soil, which requires the addition of sand or calcareous earth, to open, make it pervious to the roots of vegetables; there operates merely as a calcareous earth which quality is considered as essential to give to all soils, the capacity of attaining the highest degree of fertility; when mixed with a strong cold, heavy loam, it there promotes the decomposition of the abundant vegetable fibres, which have long been frozen up, and generates a growth which increases vegetation beyond that which it ever before exhibited.

No soils are indeed wholly destitute of calcareous matter, though not always to be discovered by chemical analysis; and but few in Massachusetts possess so large a portion of it, which would be salutary, as there is no district abounding with chalk, or lime stone, which are the great sources of calcareous matter; which also a constituent part of all marles, and they are efficient in promoting vegetation in proportion as this abounds compassed with the sand and clay combined with it.

*A distinguished writer on agriculture observes "that all substances in which calcareous matter is contained, have been successfully employed as manure, at different times, and in different places."

"Thus lime, marle, chalk, lime stone gravel, shelly sand, shells of every kind, have been employed with the greatest success. And as these, excepting lime always contain the calcareous substance in its mild state, we are led to conclude that they operate on the soil, more as calcareous and not as saline substances."

As burning is the usual, if not the only mode employed for reducing lime stone to powder, and thus preparing it to be used as a manure, the opinion has prevailed, that calcination necessary for rendering lime stone capable of becoming manure, but experience has proved that this is not the case. Mr. Du Hamel was led by accident to observe that, "powdered lime stone was a manure equally efficacious lime itself. After repeated experiments found it never failed to promote the fertility of the spot on which he applied it, in a very high degree."

A little reflection on the physical cause of the difference between lime, and lime stone, will

* Lord Erskine.

* Anderson.

duce this conviction; for lime is no sooner exposed to the air, than it begins to absorb the air of which it has been deprived by burning, and returns to its former mild state; or in other words becomes effete; in which state it possesses the same chemical qualities, in every respect, and no other, as lime stone.

Hence then it must follow, that as lime is converted into the same state as lime stone, in few days after it is mixed with the soil, that it produces any effect at all as *lime—as a saline substance*, it can only be at first, when it is applied; and it must act ever afterwards merely as powdered lime stone or calcareous earth. Experience shows, that lime produces scarcely any visible effect as a manure at the beginning.—Even the first year after it is applied to the soil, its effects are inconsiderable in comparison of what it produces in the second and succeeding years. From whence we must conclude that it operates upon the soil merely as a dry and calcareous earth; and that its calcination of no further use in preparing it as a manure, than as a cheap and efficacious method of reducing the lime stone to fine powder; and to facilitate the transportation where it is to be carried any distance, for lime stone loses about two thirds of its weight by burning.

Although lime stone no where abounds in our country, yet lime as an article of merchandise, is easily attainable, and at a price so moderate, that its efficiency, as an improver of our soil, is ascertained by our own experience, it may be found in practice the cheapest manure we can obtain. 10 or 12 casks, it is believed, will make a competent dressing for an acre, spread on the furrow and harrowed in, with the grain and grass seed; and its effects are thought to be more durable than any other manure.

Although 10 or 12 casks, or even less, may make a competent dressing for an acre, yet like all compost manure, it is believed to be powerful in proportion to the quantity used; and is not liable to the objection sometimes made against gypsum, that it leaves the land dead, for it said "to act powerfully on land naturally barren as upon that which is more richly impregnated with those substances which tend to produce a luxuriant growth."

It is stated by a distinguished tourist,* in his travels through New-England, that a "line drawn from the north and south across Massachusetts, 30 miles from the Connecticut river, bounds the soil that is natural to the production of wheat, although the crops are grown on favored spots with particular attention to their preparations." If this is the fact, it goes far to support the suggestion, arising from the total absence of lime in the soil, chalk, and marle, the great if not the only source of the calcareous substance, that the soil of this State is deficient of its proper proportion of that ingredient, necessary to the production of some plants, and conducive to the endurance of all.

YEOMAN.

* Mr. Dwight.

From the United States Gazette.

FRUIT.

It is surprising to notice the inattention of our Farmers to their Orchards. Some think it unnecessary to cultivate any fruit at all, while a large proportion suffer their lands to be occupied

by trees which will neither warm by their wood, nor gratify by their fruit,—hundreds of stunted apple trees may be seen cumbering the ground, where a little attention would have produced a profitable orchard. The vast difference between good and bad apples, peaches and pears, is not in many other cases, the result of much labor and skill; it is effected by some trifling attention to the tree in its earliest stage. There are few who do not like good fruit in its season, and good fruit is seldom out of season—yet fruit trees are seldom attended to, and their qualities still less minded. A farmer with an orchard of 80 or 100 trees, is too often contented if four or five of them bear a palatable apple, 'the rest,' he will say, 'will do to make cider.' Now the same attention and care which brought up the 91 bad and 6 good trees, would have produced the whole 100 of the best quality—and farmers begin to learn, that the quality of the cider depends upon the apple. Some body has said that "planting trees was among the duties which the present generation owes the next;" if so let our agriculturists discharge the duty towards their children better than our predecessors have to us; do not continue to cultivate trees which can produce nothing but crabbed unpalatable fruit, merely because we found such in our fields, lest our children say, "Our Fathers have eaten *sour* grapes and our teeth are set on edge with them." Appropos, of grapes, this is the season for trimming the vines, which should be effected with precautions against a loss of sap. The astonishing increase of the vine in this city and vicinity, shews what may be done by a little attention, patience and care. Grapes of a very delicious flavor now form a common dessert. The same attention in this country and a little more patience would produce the same beneficial results in regard to apples, pears, and peaches.—Our market is every season over stocked with peaches; yet we have very few that are considered of a superior quality, while cart loads are hourly exhibited, to unprovoked appetites. The fact is, for want of due attention, a great proportion of our fruit is

— "Like

To Jeremiah's Figs—

The good is very good, the bad

Too bad to give the pigs."

The subject is worthy the attention of Farmers, and we hope they will think it is their interest to grow, (to use a most ungrammatical word) trees that will produce palatable and wholesome fruit.

EXTRACTS

From the Message of his Excellency, Lieut. Gen. Sir JAMES KEMPT, Governor of Nova Scotia, delivered at the opening of the session of the Legislature of that Province on the 8th of January last.

"It was expected that many beneficial effects would result from a general diffusion of agricultural knowledge and improvements, throughout the country, by means of the institutions formed for that purpose: but the expectations which even the most sanguine entertained, promise to be completely realized. Habits of active industry and systematic frugality, are taking deep root, I have reason to believe, among the farming classes of the community; and I think the day is not far distant, when Bread Corn, will be

raised within the province, sufficient to supply the wants of its population.

"Trade is increasing, and beginning to embrace new sources of commercial employment. Our Fisheries have been carried on with increased activity during the past year—in every branch of our industry there is a visible improvement.

"I have great pleasure also, in reporting to you the state of the Provincial finances:—The Revenue of the last year has somewhat exceeded the sum which was anticipated:—It has been faithfully collected, and every demand upon the Government punctually discharged. In addition to the Revenue raised under Provincial statutes, considerable sums of money have been paid into the Treasury by the Collector of his Majesty's Customs, (Duties arising under acts of the Imperial Parliament to extend and regulate the Colonial Trade,) which payments have enabled me to cancel Provincial Notes to nearly a corresponding amount."

From the Providence Gazette.

The following recipe to cure a cold, is said to be efficacious, that we republish it at the request of a correspondent who has tested its virtues.

Take a large tea-spoonful of flaxseed, with two penny worth of stick licorice, and a quarter of a pound of sun raisins. Put them into two quarts of soft water; and let it simmer over a slow fire, till it is reduced to one; then add to it a quarter of a pound of brown sugar candy, pounded, a table-spoonful of white wine vinegar, or lemon juice.

Note. The vinegar is best to be added only to that quantity you are going immediately to take; for if it be put into the whole, it is liable, in a little time to grow flat.

Drink half a pint at going to bed; and take a little when the cough is troublesome.

This recipe generally cures the worst of colds, in two or three days; and, if taken in time, may be said to be almost an infallible remedy. It is a sovereign balsamic cordial for the lungs, without the opening qualities, which endanger fresh colds on going out. It has been known to cure colds, that have almost been settled into consumptions, in less than three weeks.

From the Connecticut Mirror.

Mineralogy.—While Canals and Tariffs, and improvements in River Navigation, are afoot—while speeches are made tending to shew the true course of policy to be pursued by government and by the nation—while all think and speak of the capabilities of the country and the resources that are to be developed, it may not be amiss to turn our attention to the subject which heads this article.

Professor Hall, of Middlebury College, has published a book of about fifty pages, which will direct the mineralogist in searching for the best localities throughout all the Northern, most of the Middle, and much of the Southern and Western parts of our long and broad country. The minuteness, the brevity, and the clearness of the statements, are admirably calculated to answer the purposes of the explorer, and the alphabetical arrangement of the Minerals, with the authority on which the statements are made, must render it convenient, safe and useful.

From the National Egis.

Barre, Jan. 30, 1824.

MR. ROGERS.—In the summer of the year 1822, I raised from *one potatoe*, the growth of the preceding year, *one bushel, three pecks and two quarts*, of very sizeable ones. To such as may doubt my veracity, I can produce satisfactory testimony; and to such as may think this product small, I would recommend the divine command, "go thou and do likewise."

GARDNER RUGGLES.

NEW ENGLAND FARMER.

SATURDAY, FEBRUARY 28, 1824.

[Continued from page 236.]

PARING AND BURNING. Mr. Nicholson, author of the *Farmer's Assistant*, in an Essay, which obtained a premium from the Agricultural Society of Albany County, New York, has the following observations on this subject.

"A practice has long prevailed in Europe of paring and burning soils, for the purpose of improving their texture and increasing their fertility. On clay lands, and such as contain too much vegetable matter, we conceive the process might be advisable, if not too expensive. Its effect on clays is to destroy the adhesive quality of the soil, as the earth burned becomes rather of a silicious texture; and at the same time the surface is much enriched by the operation. In the other case it is calculated to reduce the redundancy of vegetable matter as well as to enrich the soil. The operation is performed in the following manner:—

"When the ground is in a good sward of grass let it be carefully turned over with the plough; the irons of which should be well sharpened. Let the plough run about three inches deep. Then cross plough with a very sharp coulter, and the sward all be cut into squares of about ten or twelve inches. Set the square clumps up edgewise, by leaning two together and they will soon dry. When well dried, build a part of them up in the form of little ovens, at a distance of about 10 feet each way. These are all to have a little opening or door, at a common windward side, for the air to enter, and another opening above for the smoke to pass off. On some dry day, when the wind is fair for blowing into the holes below, place some straw or other dry rubbish into the holes, and set fire to it. As soon as the fires have got fully going in each of the heaps, let the holes in the tops be stopped up, for the purpose of retaining the smoke, and keep gradually building up the heaps, as the fire penetrates them, until all the chunks of earth are piled round them; and when the heaps have fully burned, and sufficiently cooled, they are to be evenly spread over the ground and ploughed in."

Mr. Cobbett's mode of burning is as follows:—

"Make a circle or oblong square; cut sods and build a wall all round three feet thick and four feet high, then light a fire in the middle with straw, dry sticks, &c. extending it all over the bottom of the pit; keep adding light fuel at first, then rubbish wood, till there is a good bed of coals. Then put on the dryest of the cloths, taking care to keep the smoke in. Continue thus for a day or two, when you may dig out the earth any where about the kiln and fling on. Put your finger into the top of the heap here and there; if you find the fire very near, throw on more earth; not too much at a time, for it deadens the fire. The ashes (or torified earth) will be cool enough to remove in a week, peat or bog earth may be burnt in the same way, or dry, as in the paring and burning method. Some only kindle a fire and lay on dry sods at first, and when the whole is under good way, throw on the earth, (subsoil, &c.) to be torified, till the heap is sufficiently large. This manner applied to cabbages, ruta baga, Indian corn, and buck wheat, produces great effect."

It will be observed that Mr. Cobbett's directions are not intended merely for burning the surface of the soil, but for burning earth, for manure, including subsoil, to any depth which may be convenient. If the sub-

soil is wholly or in part clay, or perhaps any other species of earth in which there is little mixture of silicious sand, it is often useful to burn that as well as the surface. But, as has been before observed, burning sand produces no advantage, either for manuring other earth, or altering the texture or qualities of that which is burnt.

(To be continued.)

FOR THE NEW ENGLAND FARMER.

MR. EDITOR.—I frequently notice in your paper descriptions of new and valuable improvements. From this circumstance, I take the liberty to recommend through its medium not only to our country brethren, but to every citizen, rich or poor, who feeds a horse or cow, a new and very useful Machine, now in use at the extensive establishment of Mr. Niles, Hawley Place, Boston, for the purpose of cutting hay and straw. From the peculiar good feelings this gentleman bears towards this very useful implement, it affords him the greatest satisfaction to show and explain its utility. From the full examination I have given it I am fully satisfied. Its operation and effect far exceeded my expectation. It is very simple in its construction, very durable in all its parts, very effective in its operation, and I am assured by the inventor that it has cut *seventy five bushels of hay in one hour*, with the labor of two boys, not exceeding fifteen years of age.

As it is well known that common hay, straw and corn-butts, when cut and mixed, with a small proportion of grain constitute the best possible food for animals, I think this implement one of the best a farmer or stable keeper can possibly have in use. I understand that the inventor, a Mr. Willis, has an establishment on an extensive scale, is manufacturing those machines, of various sizes, and has placed them for sale at the Agricultural Establishment in Merchant's Row.

FOREIGN.

An arrival at New-York from Havre, has furnished Paris dates to Jan. 12. By these we learn that the third campaign of the Turks had proved unsuccessful, and that the Greeks obtained a naval victory on the 4th and 5th of November in the Gulf of Salante. The Greek fleet consisted of 36 vessels, and the Turkish of 34, and notwithstanding the Turks had triple the weight of artillery, the Greeks were completely successful. It is also stated that the Greeks had succeeded in cutting off the communications of the Pacha of Scutaria, with his military depositories, Arta and Prava. They had also taken an entire train of Artillery, with an immense quantity of munitions of war. The war was still obstinately prosecuted on the coast of Negropont.

An article, dated Constantinople, Nov. 20, and published in the Augsburg Gazette, informs that "all the news from the Morea agrees in stating that the Greeks have had the entire advantage in the last campaign; in consequence of which the Divan is seriously engaged in discussing this very important question:—Shall we hazard a new campaign, or shall we instantly treat with the Greeks." This subject has had a very interesting consideration, but the result is not, as yet, known.

Great excitement prevails in France respecting Deputies to represent the French people in their Chambers. Party spirit runs high.

The papers continued to speak of an expedition forming in Spain for South America, wholly on Spanish account;—but it was said Russia had been called upon by Spain, to comply with the treaty of 1817, by which she stipulated to furnish Ferdinand with five ships of the line, and three frigates, provisioned for four months.

A Tragical Criminal.—One Martial, an artist and dramatic author, attached to one of the French Theatres, was recently tried and convicted of theft. Just as the verdict had been read, and the Attorney General moved for sentence. Martial drew from under his clothes a short knife, with which having struck his throat several times, he threw it at the feet of the Jury, and fell lifeless in the bar. A general movement of horror pervaded the Court, and several females fainted. The Judge ordered a physician to be called. There

happened to be one on the Jury, who rapidly approached the culprit; the gens d'armes also ran to his relief. Martial pulling open his shirt, discovered his neck which had not the slightest mark of injury; the knife was so dull, that it had not even bruised the skin. The agitation produced by this tragic scene, as rapidly subsided, and the accused heard with great composure though protesting his innocence, his sentence of imprisonment for five years.

Jonah and the Whale.—Dr. Pearson, of London, lecturing upon the stomach, observed that this organ had no power over substances endowed with vitality, and that this circumstance accounted for the fact of the prophet Jonah having remained undigested in the stomach of the whale for the space of three days and three nights. Dr. Pearson's discovery is highly important both in a medical and theological point of view.

Perkins.—Extract of a letter dated Liverpool, Dec. 15.—"Our countryman, Perkins tells me that he has invented a Steam Engine to go in the long boat of a Luddman, and to take up but little room, that will take her three miles an hour in a calm, and which will take in operation next summer; also, that he has completed the most difficult part of the Steam Machinery, that returning the steam, and that it will require so little fuel to keep the steam up, that he is at present afraid to mention the minimum."

DOMESTIC.

Fire.—Between 12 and 1 o'clock on the morning of the 25th inst. a fire took place in Providence, R. I. commenced in buildings near Market Square, owned by Messrs. Charles Potter, John Brewer and Joseph Hawes. The flames burst through the roof and threatened destruction to the whole range; but by great exertions were extinguished, after the buildings had sustained considerable damage. Mr. John Hutchins bookseller, sustained considerable loss. The office of the R. I. American was in danger and sustained some loss.

A melancholy event lately occurred at Jersey City by the administering of laudanum for paragonic. Two children of Mr. Isaac Edge, Jr. being sick, Mrs. E. set to a store for a bottle of paragonic, and by mistake the clerk the bottle was filled with laudanum, which was given to the children.—The eldest an interesting girl, aged 20 months, died in 18 hours after the laudanum had been given. The other, a boy only 3 months old, lies dangerously ill, with little hopes of his recovery.

Ephraim Colburn lately convicted at New-Haven aiding and assisting in opening and removing the bod of a young female from the burying-ground, for dissection has been sentenced to nine months imprisonment and to pay a fine of three hundred dollars.

On the 11th inst. a destructive storm took place at Wilkesbarre, Pa. which did much damage by leveling houses, unroofing and overthrowing barns and other buildings, blowing down chimneys, trees, &c. The elegant bridge over the Susquehanna River was like wise destroyed. It was lifted from its foundation in body, and hurled from the piers on to the ice, and some of the timbers were carried 30 or 40 rods. The New Episcopal Church also received considerable damage. The loss sustained in the valley is estimated at not less than \$50,000.

Uncle Tom's Visitors.—On the 29th of January, three large Bears made their appearance in the village of Chamblay, near Lake Champlain. The first was seen between 3 and 4 o'clock in the afternoon, in the garden of Samuel Hatt, Esq.; another was observed endeavoring to get over a garden fence, and a 3d paraded thro' the main street. The villagers not expecting such a visit, were not prepared to give them the reception they deserved, and they all deliberately walked to the woods before the business of loading and priming could be attended to.

Thursday the 1st day of April next, has been appointed by the Governor of this State, a day of Fasting and Prayer.

The dwelling house of Dr. Oliver Morse, of Danville, Vt. was destroyed by fire on the 10th inst. The family were absent, except two small children and a girl about sixteen years of age.

Incendiarism.—A most daring and villainous attempt at conflagration, was made at Savannah, on the night of the 10th inst. About 11 o'clock, the house of Dr. or was discovered to be on fire beneath the stair case, the fire having been communicated from without. Fortunately the family had not all retired to rest, and the flames were soon extinguished. A negro man and two females have been arrested on the strongest suspicions.

CONGRESSIONAL.

IN SENATE.—Friday, Feb. 13. Mr. Talbot submitted a resolution for authorizing the removal of causes certain cases from State Courts to those of the United States.

A petition from sundry aliens in New Orleans for a modification of Alien Laws, and a memorial from South Carolina, against the proposed Tariff Bill, were read and committed.

The New Orleans Military Road Bill; the bill relative to Pensions to certain widows and orphans, and a resolution for the purchase of one copy of Lucas' Atlas, passed.

Monday, Feb. 16. The Senate, in Committee, resumed the further consideration of the bill to "abolish imprisonment for debt." Mr. Johnson, of Ken. advocated the bill in a speech of nearly two hours. The object was then postponed.

Tuesday, Feb. 17. Mr. Barbour advocated the bill abolishing imprisonment for debt, and the further consideration of it was postponed to Friday next.

Wednesday, Feb. 18. Mr. Chandler, from the Military Committee, reported a bill for the more effectual protection of the country by the establishment of Militia throughout the United States, &c.

Thursday, Feb. 19. This day was chiefly occupied in private, local and executive business.

Friday, Feb. 13. A bill better to provide for taking evidence in the Courts of the United States, in certain cases, was reported by Mr. Plumer, of N. H. and read twice.

The bill from the Senate, authorizing the building of additional Sloops was reported by Mr. Crowninshield, of the Naval Committee, and referred.

The House, in Committee, resumed the consideration of the Tariff Bill.

The motion of Mr. Tracy to increase the duty on imported distilled spirits to fifty per centum, was negatived by a large majority; and that of Mr. Foster to cut out the duty on spirits was likewise negatived. Several other motions for making alterations in the Tariff were also negatived.

Monday, Feb. 16. The Judicial Committee were instructed to report on the expediency of authorizing the nomination of Jurors to serve in the Courts of the United States, in each State, conformable at all times to the mode of designating Jurors, which may be adopted in State Courts of such State.

The House, in Committee, resumed the consideration of the Tariff Bill. The question was on the motion to strike out the duty of six cents per square yard on Cotton Bagging imported. Mr. Hamilton supported the motion to strike out the duty. Mr. Trimble opposed. Mr. Brent, of Lou. Mr. McKim, Mr. Todd, Mr. Cook, Mr. Buchanan, Mr. Gurley, Mr. Sanford, Mr. May, and Mr. Owen delivered their sentiments on the subject.

Tuesday, Feb. 17. The subject of the Tariff was resumed, and the day spent principally in debating on the point coming to a decision.

Wednesday, Feb. 18. This day was also principally spent in debates on the Tariff.

Thursday, Feb. 19. Mr. Owen offered a resolution on the Committee of Ways and Means be instructed to examine and report to the House, what will be the effect on the revenue of the United States, if the proposed alterations in the Tariff should take place. This caused a sharp debate, which was closed by the Speaker's calling for the order of the day. The Military appropriation bill was then taken up and discussed, but not completed.

MASSACHUSETTS LEGISLATURE.

IN SENATE.—Wednesday, Feb. 18. A bill establishing salaries for Judges and Registers of Probate was introduced, and amendments, which have been concurred in by the House.

A resolve passed appointing the Hon. Nathaniel Bowditch, and Professor Farrar to ascertain the present value of the reversionary interest of the Commonwealth in the several Bridges, &c. and report to the next Legislature.

A Bill to encourage Medical Science, (allowing \$1000 to the Berkshire Medical Institution) passed to be engrossed.

Thursday, Feb. 19. The Governor, by Message, transmitted the correspondence between the Agents of this State and himself, respecting the difference with the Agent of Maine, which was referred to a Joint Committee.

The Militia bill and a bill regulating the taxation of the property of Manufacturing Corporations were indefinitely postponed.

Friday, Feb. 20. Sundry resolves respecting the adjustment and settlement of the claim of the Commonwealth on the U. States, were reported and referred.

On motion of the Hon. Mr. Perkins the thanks of the Senate were presented to the Hon. Nathaniel Sillsbee, to which Mr. Sillsbee returned an eloquent and suitable reply.

Saturday, Feb. 21. The Hon. Mr. Leland, from the Committee to whom was referred the Message of the Governor transmitting the correspondence relative to the difference of the Agents of this State, and the Agent of Maine, on the claim of the State, reported, that it is inexpedient to publish said correspondence. An animated debate ensued; and on taking the Yeas and Nays, it was found that the Senate agreed to accept the report. Yeas 22, Nays 10. Several other resolutions on this subject were proposed but not acceded to.

A resolve passed to appropriate \$2000 for the use of Agents in Washington.

In the evening, about seven o'clock, the Secretary came in, and read a list of Acts (100) which had been approved by the Governor, and stated that he had been pleased to prorogue the General Court to the Tuesday next preceding the last Wednesday in May.

Horse. Wednesday, Feb. 18. The Mechanic and Traders Incorporation Act, and the bill respecting the interment of suicides passed to be enacted.

The House re-considered its vote granting leave to build a bridge or dam from Wheeler's Point to South Boston, and the further consideration of it was postponed indefinitely.

Thursday, Feb. 19. A bill declaring the causes for which cattle may be impounded was referred to the next Legislature. A number of bills were finished, among which were a bill to prevent fraud in the admeasurement of salt, grain, &c.—In addition to the law respecting inspectors and the manufacture of Gunpowder, and in addition to the law concerning Hawkers, &c.

Friday, Feb. 20. The proposal for an Amendment of the Constitution, authorizing the Legislature to increase or diminish the salaries of the Justices of the Supreme Judicial Court was indefinitely postponed.

On motion of Mr. Welles, of Boston, the thanks of the House were presented to the Hon. William C. Jarvis for the impartial, dignified and able discharge of his duty, as Speaker of the House the past year. To this the Speaker made a pertinent and eloquent reply.

Saturday, Feb. 21. Ordered that the Attorney and Solicitor General be directed to inquire and report to the next General Court, at its first Session, what right exists under any act of the Legislature, for the drawing of any Lottery, or for the vending of any Tickets within the Commonwealth, and if any such right exists, when it will terminate by law.

In the evening the House was prorogued, in the usual form, to the Tuesday next preceding the last Wednesday in May.

The following are the heads of the General Acts, passed the present Session:—An Act giving remedy in equity on Gaol Bonds.—Regulating the hunting of deer.—In addition to an act regulating Marriage and Divorce.—In addition to an act making further provision in the Judicial Department.—In addition to an act respecting Public Worship and Religious Freedom.—To alter and amend an act to provide for the instruction of youth, and the promotion of good education.—To prevent the wanton destruction of lamps.—Making further provisions for the service of writs and the setting off judgments.—For preventing fraud in the admeasurement of salt, grain, &c.—In addition to an

act entitled "an act providing for the appointment of Inspectors, and regulating the manufacture of Gunpowder."—In addition to an act entitled "an act concerning Hawkers, Pedlars, and Petty Chapmen."—For the better regulation of jails and the prisoners therein.—In addition to an act entitled "an act regulating the practice of Physic and Surgery."—Authorizing fiances covvits to join with the guardians of their husbands in the sale of real estate, held in right of the wife, and to release their dower in certain cases.—Establishing salaries for Judges and Registers of Probate.—For the encouragement of Medical Science.

In addition to an act for the choice and appointment of Assessors, and for assigning their powers and authority.—To prevent fraud in the attachment of real and personal estate.—Regulating the storage of Gunpowder.—To repeal an act giving further remedies in equity.—To repeal an act entitled an act against self-murder.—An act to apportion and assess a tax of \$75,000; and to provide for the reimbursement of \$16,500 paid out of the public treasury, to the members of the House of Representatives, for their attendance the two last sessions of the General Court.—To repeal an act entitled an act to restrain the issuing of printed promissory Notes, of certain denominations, and other purposes.—Authorizing Executors and Administrators to plead plene administravit in certain cases, and to settle the estates of their testators and intestates.

THE GRAVE.

BY BERNARD BARTON.

I love to muse when none are nigh,
Where yew-tree branches wave,
And hear the winds, with softest sigh,
Sweep o'er the grassy grave.

It seems a mournful music, meet
To soothe a lonely hour;
Sad though it be, it is more sweet
Than that from pleasure's bower

I know not why it should be sad,
Or seem a mournful tone,
Unless by man the spot be clad
With terrors not its own.

To nature it seems just as dear
As earth's most cheerful life;
The dew-drops glitter there as clear,
The sun-beams shine as bright.

The showers descend as softly there,
As on the loveliest flowers;
Nor does the moonlight seem more fair,
On beauty's sweetest bowers.

Ay! but within—within there sleeps
One, o'er whose mouldering clay,
The loathsome earth-worm winds and creeps
And wastes that form away.

And what of that? the frame that feeds
The reptile tribe below,
As little of their banquet needs,
As of the winds that blow.

MISCELLANY.

ICE.

Two or three mild winters, of late in succession, have brought a new article of foreign trade into England. Ice, for the use of the confectioners, comes now to us all the way from Norway; where a gentleman, we understand, is making arrangements to send over even snow, at a far cheaper rate than it can afford to fall in this country, so that frost in fact, (as regards Great Britain and Ireland) may consider itself discharged from further attendance; and with the help of a few more commercial arrangements, and perhaps a new improvement or two as to the application of steam, it shall go hard but we will shortly turn the seasons out of doors altogether. As this imported ice, jealous of sunshine, is foremost in our streets now of mornings, moving along in huge cart loads from the below bridge wharfs: and looking, as it lies in bulk, like so much conglutinated Epsom salts.—*Blackwood's Magazine.*

Luxury of Boston.—One of the direct causes of that excitement ripened into open resistance of the Mother Country in this Colony, was the luxurious mode of life of some of the King's officers. In an old diary of a maiden lady, I got these memoranda of a dinner given by one of these officers, on Saturday, the 3d of January, 1771:—"The fish was excellent, it was caught in cold weather on the Grand Bank—the beef uncommonly fine, came from Vermont, and was dressed by a cook, who had learned his art in France.—The *caracas* buck ducks were sent on by a Provincial Commissioner, who had gone to the South, and were done to a turn—

the *venison* came from Canada, and never was there better, or better done—and the *beaver tail*, dressed according to directions from an Indian Princess, came from Lake Ontario—the liquors were all good, and among them Corsica and Madeira, and Champaigne wines; but these were, at length, neglected for the *native Curraco*, which some of the Commissioners excelled in brewing."

It is among the blessed fruits of the revolution, that these excesses in luxury have gone off, with the Royal authority; and that the descendants of the Pilgrims in these days, though not ignorant of what are good things, delight to exhibit on their tables, among other plain good fare, the *beans* and *homing* in which their forefathers delighted.—*Boston Daily Advertiser.*

The Biter Bit.—In the course of pleadings in the Court of Chancery, the other day, Sergeant Bosanquet made several quotations to prove that the intervention of a priest was necessary to constitute a legal marriage, even before the passing of the marriage act. Among other instances he adduced the following amusing anecdote of General Fielding:—"The general was desirous of marrying a lady of beauty and fortune; for this purpose he selected a lady of the name of Mrs. Deloe, who, he heard, possessed both of these valuable attractions; not being acquainted with the object of his fanciful admiration and mercenary designs, he purchased the promised assistance of the lady's waiting woman, by a donour of £500. The servant, considering that the General was not a suitable husband for her mistress, he was, however, a very desirable connubial partner for a friend of her's, introduced him to a lady of the town named Mrs. Wadsworth, as her mistress, Mrs. Deloe. The General was captivated with the fictitious Mrs. Deloe, after a few interviews, the enamored fortune hunter solicited the felicity of his charmer's hand—the gallant and accomplished General was irresistible.

And all things with due decorum carried, Miss frowned and blushed, and then was married—by a Roman Catholic priest, in the suite of the Portuguese ambassador. The General soon discovered the cheat, left his spouse, and some time after married the well known Dutchess of Cleveland. Her grace's two sons having no predilection for their new father-in-law, wished to dissolve the connexion, and prosecuted him at the Old Bailey for bigamy. The original marriage by the Roman Catholic priest having been proved, the General was convicted, lost his liberty and noble consort, and the sons, to their great pleasure, got rid of their new paternal protector.

A Christmas Gambol.—A gentleman of fortune in — Square, gave his domestics permission to amuse themselves in the evening, and to invite such of their acquaintance as they thought proper.—On consultation, the servants agreed (one of them having a relation in the neighborhood who kept a masquerade wareroom) to practise *High Life Below Stairs*, by appearing in masks. Their master, hearing of their intention, privately determined to make one in the frolic, as his wife was to spend the evening out; and the lady, from some vagary or other, shortly after she had been on her visit, took leave,

went to a masquerade-room, dressed as a Witch, called a hackney-coach, drove home, and mix with the company. From his voice, and other circumstances, she quickly discovered her husband.

"Well, Madam Witch," cried he; "what news from the air?"

"I'll tell you," returned she, in a whisper: "I'm just flown from — Square, with tidings—that a certain married lady, on a visit the Countess of —, is this instant eloped."

Off flew the husband, like an arrow from bow. No tidings of his lady in — Square. He returned home in great embarrassment, and desired the mask in character of a Witch, step into an adjoining room. She attended.

"Witch or no Witch," exclaimed he, "tell me this instant, where's my wife?"

"Here, my love!" said she, taking off her mask.—He flew into her arms.

May all Christmas Gambols prove equally happy and innocent.

[*London Lady's Museum.*]

FOR THE NEW ENGLAND FARMER.

Learning.—It is better to have wisdom without learning, than learning without wisdom and knowledge without good sense to regulate it, is like self-righteousness, the more one of it the worse it is for him.

An Antiquary.—A thorough paced Antiquary not only remembers what other people have thought proper to forget, but forgets what other people have thought proper to remember.

Talent and Wealth.—Gross and vulgar mind will always pay a higher respect to wealth than to talents; for wealth, although it be a less efficient source of power than talent, happens to be far more intelligible.

Pride and Humility.—Some people are proud of being thought incapable of pride; and are stepping stones of humility in order to ascend the pinnacle of ambition.

When articles rise, the consumer is the loser that suffers, and when they fall he is the loser that gains.

The man of pleasure should more properly be called the Man of Pain. He purchases penitence at the highest price, and sells the richest reversion for the poorest possession.

BRISTOL CROWN GLASS.

150 BOXES Bristol Crown Window Glass, of superior quality, just received and for sale wholesale and retail, at the very lowest prices, by BRIGHAM & DELANO, No. 30, Union-st.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of *Mangel Wurtzel Seed*, raised by John Prince, Esq., ofbury.

WANTED to purchase twenty or thirty full blooded Merino Ewes. Address, or apply to DAWSON, Broker, Exchange Street, Boston. Feb. 21

acts and Observations relating to Agriculture and Domestic Economy.

[BY THE EDITOR.]

ON THE USE OF SALT AS A MANURE.

[Concluded from page 210.]

Manures may be divided into two classes.—The one is called animal and vegetable or putrescent manures. They consist of decayed and decaying animal and vegetable substances. The other class is denominated fossil manures. The first mentioned do not properly constitute the food of plants, although they enter into the composition of vegetables in minute quantities. Fossil manures stimulate plants, and cause them to take their food faster than they otherwise would do. They are like what medical men call condiments, and answer the same purpose as respects the economy of vegetables, which is, pepper, spices, &c. effect as regards the animal economy. Under the class of fossil manures are also placed not only lime, marl, and gypsum, but sand, gravel and clay. All of these, and their elements are found in plants by chemical analysis. Sir Humphrey Davy says "the elements found in plants are four; silica or earthy parts, alumina or pure clay, lime and magnesia." These constitute all the principal kinds of earth, are procured by burning, and detected in the ashes of vegetables. As they form a part of the substance of plants, they would seem to be part of the food of the plants. But as they are found in very minute quantities only, they are, strictly speaking, no more to be considered as food of plants than salt, pepper, and spices may be said to be the food of animals. The oxides of iron and manganese are sometimes found in plants; yet nobody would class those substances with manures, or what is the same thing, food for vegetables.

Fertilizing land is nothing more than providing food for the crop which you intend to raise on such land. You can no better feed your plants with salt alone than you could your sheep or horses. Salt rather qualifies and prepares land for animals and vegetables than constitutes a food. Manure properly so called must supply the nutriment of plants in oxygen [vital air, carbon, fixed air] or azote, [one ingredient of the atmosphere.] "Plants are found by analysis to consist principally of charcoal and aeriform water. They give out by distillation volatile compounds, the elements of which are pure air, inflammable air, coal matter and azote, or that elastic substance which forms a great part of the atmosphere, and which is incapable of supporting combustion."* Plants when burnt leave in their ashes pot ash or soda (which last is one of the ingredients of common salt) together with some or all the above mentioned kinds of earth. Now as plants consist "principally of charcoal" it would seem that charcoal should be the principal ingredient in manure. And the theory comports with what is found to be true by experience. Stable manures, which generally speaking are among the best manures, consist chiefly of carbon, and during their de-

composition or while they are rotting give out principally carbonic acid gas. That is they supply plants which consist "principally of charcoal" with the charcoal they need. But common salt is a compound of muriatic acid and soda, or according to Sir Humphrey Davy, of his newly discovered metal called sodium, and chlorine. Now as neither of these substances, either in their simple or compound state, contain carbon, which is the article most in demand by growing vegetables, it is plain that salt can furnish but little nutriment to plants. We therefore think that the author of "Letters of Agricola" is perfectly correct, when he says "We must not imagine that the farmer, in his application of fossil matter is as much providing a store of aliment for his crops, as when carrying to his fields the contents of his dung-hill. In this latter case he is literally preparing the banquet for the feeding fibres; in the other, his practice is guided by totally opposite views. The putrescent manures, are strictly and properly the food of vegetation as supplying either the ternary or quaternary products which are the previous results of a vital principle, or their component elements of carbon, hydrogen, oxygen and azote: the fossils on the other hand, enter in a very partial manner into the system; and though no chemical substances have been lifted to the rank of manures, which have not been found in the organization, yet their agency must be referred more to other causes, such as being offensive to grubs and insects, altering the mechanical texture of the soil and its relation to atmospheric absorption, or rendering it more or less retentive of water."

A certain proportion of common salt is no doubt a useful ingredient in every soil. But it is often supplied by the hand of nature. Sir Humphrey Davy says, "I have found salt in all the sand stone rocks that I have examined, and it must exist in the soil derived from these rocks. It is a constituent likewise of almost every kind of vegetable and animal manure." If it already exist in the soil in sufficient quantity, any addition must be injurious. To ascertain whether there is a sufficient quantity of salt in a soil to answer the calls of vegetation the cultivator must either have recourse to experiments as directed pages 209, 210, or chemical analysis, as described page 68. Some attention must be paid to the nature of the crop to be cultivated. Flax requires more salt than common crops, and we believe all plants of an oily or mucilaginous nature require salt, in larger proportions than others, which contain little or no oil or mucilage.

With respect to the different results of experiments with salt as a manure, such as that of Dr. Deane, who "could not perceive that the salt was at all beneficial to onions,"*—and Mr. Beck, who "found salt to exceed every other kind of manure" for the same plant, we can in no other way account for them but by supposing the soils in which these experiments were made to have been different. The one proba-

bly contained salt sufficient to supply the onions with as much as was necessary for their flourishing, and the other being naturally destitute of salt, it was found useful to furnish it by art. The same reasoning will apply to gypsum and indeed to all other applications to soil with a view to increase its products. If your land has already a sufficient quantity of animal or vegetable matter, even stable manure would be worse than useless if applied to such soil;—it would prove positively injurious.

If salt alone was in all cases a useful manure we could have no barren sea coast. All lands subject to the saline influences of the sea must become as fruitful as if they had been for a long time watered with the drainings from a dung heap. Cape Cod would be as fertile as the Garden of Eden, and the most arid sands on the sea coast would, many ages since, have been converted into rich mould, as fertile at least as the sediment deposited by the overflowing of the Nile. We do not make these remarks with a view to discourage cultivators from the application of salt to their soil, but to render them cautious in such application. We believe salt may be an auxiliary, but not a substitute for the recrement of animals and vegetables, commonly used as manures.

Sea water is doubtless as an application to soil much preferable to salt. It contains, besides salt, dirt or mud suspended in the fluid, carbonate of lime, muriate of lime, sulphate of lime or gypsum, magnesia, muriate of magnesia, or Epsom salt, calx of iron, muriate of iron, &c. But none of these except the mud, are capable of supplying the want of the carbonaceous and other matters which give their principal value to animal and vegetable manures, and the mud is not always obtained from the wash of the sea in quantity sufficient to produce much effect.

STEEPING WHEAT IN SALT WATER, &c. A correspondent of the Farmer's Journal, an English Newspaper, inquires whether "steeping wheat in salt water for many hours will destroy the germinating powers of the grain?" To this query the Editor of that publication replies, "we have known that when wheat has lain in the edge of the tub during the whole time of brining, a fortnight or more, and has been purposely tried, and have grown as well as any other."

Probably the strength of the brine, and the temperature of the weather would make a difference in this respect. We have known garden peas steeped in a strong solution of salt petre till they would not vegetate, when planted, but cannot tell either the strength of the solution, the length of time the peas were immersed in it, nor the temperature of the weather, during the time the peas were steeping. Although we do not believe in the fertilizing power of steeps, yet we think they may sometimes be of service. But lime water, solutions of blue vitriol, copperas, common salt, and salt petre, have all a tendency to preserve seeds from being destroyed by insects, while in the ground, or pulled up and devoured by crows, or other birds. It is then desirable to know how strong

the steep should be made, and how long the seeds should be immersed, so as not to destroy the power of vegetation, and at the same time preserve the seeds against worms, &c. Experiments to determine these points are much wanted.

It is believed that if ground where seeds are planted is moist, and the seeds are planted early, it is best to put them into the ground without soaking them, either in pure water, or any sort of pickle; because if soaked they are more apt to rot without sprouting. But if the ground is dry, and the seeds put in late, there is advantage in steeping them, either in a suitable pickle or in pure water. In the former case the pickle at once accelerates the sprouting and preserves against insects. In the latter case the germination is quickened by the moisture, which in late planting or sowing, may be of material service to the crop.

From Thacher's American Orchardist.

ENGRAFTING.

The art of engrafting has not, it is believed, been traced to its origin. In a treatise, published by Parkinson, in 1629, both grafting and inoculating are mentioned, but the period when the practise commenced has not been ascertained. The great utility and advantage of the art is, however, universally understood. According to Mr. Yates, (letter published in Forsyth's Treatise,) the art was introduced into America by Mr. Prince, a native of New-York, who established a nursery in its neighborhood about sixty years ago. Fruit trees, which are grafted or inoculated, come into a bearing state several years sooner than those produced from seed: besides, grafted or inoculated trees invariably produce the same kind of fruit as the parent tree from which the scion or bud is taken, while that from seedling trees is liable to sport in endless varieties. In the choice of scions for grafting, the first essential requisite is, that they are of the same genus and natural family with the stock which is to become their parent, and which is to afford them future nourishment and support. The apple cannot be advantageously engrafted on a pear stock, nor will a pear succeed well on an apple stock; for although it may flourish and bear fruit for a few years, it will never prove a profitable tree, and will decline and decay sooner than others. Scions from a winter apple tree should not be grafted on a summer apple stock, because the sap in the summer stock is liable to decline and diminish before the winter fruit has become fully ripe. In the memoirs of the American Academy of Arts and Sciences, volume 1, page 383, is a communication from the late honourable B. Lincoln, relative to the engrafting of fruit trees, &c. in which he says, "I had observed, for a number of years, an apple tree in my orchard, the natural fruit of which was very early, having been grafted with a winter scion, producing fruit very like in appearance to the fruit produced by the tree whence the scion was taken, but destitute of those qualities inherent in that fruit, and necessary to its keeping through the winter. This led me to call in question the propriety of grafting winter fruit on a summer stock." &c. A pear is occasionally engrafted on a quince, for the purpose of dwarf trees, but it is of smaller growth, and less vigorous and durable than

if nourished by its more natural parent. It is next important, that scions be taken from trees that have attained to the maturity of full bearing. Perhaps cultivators, in general, are not apprized of the fact, that, if a scion be taken from a seedling tree of one or two years old, it will retain the character and undergo the same annual change as the seedling tree itself, whatever be the age of the stock into which it is inserted; and that it will remain unproductive of fruit, until the seedling tree has acquired its proper age and maturity. It is strongly to be suspected, that nursery men, either from ignorance or indifference, have disregarded this circumstance, and imposed upon purchasers trees of this description, by which their just expectations have been disappointed. Scions are directed to be cut in March, before the buds begin to swell; and in order to preserve them in good condition for grafting, they must be placed, with their lower ends in the ground, in some dry part of the cellar, till wanted. But some experienced operators prefer cutting their scions as near the time they are to be employed as may be convenient. Scions should always be taken from the extremities of the most thrifty and best bearing trees, and of the last year's growth, except only just enough of the growth of the year before to fix in the earth, to preserve them moist until they are to be used. In the Edinburgh Encyclopedia it is advised to cut the scions several weeks before the season for grafting arrives; the reason is, that experience has shown, that grafting may most successfully be performed, by allowing the stock to have some advantage over the graft in forwardness of vegetation. It is desirable, that the sap of the stock should be in brisk motion at the time of grafting; but by this time, the buds of the scion, is left on the tree, would be equally advanced; whereas the scions, being gathered early, the buds are kept back, and ready only to swell out, when the graft is placed on the stock. The selecting proper scions, the writer observes, is a matter of the greatest importance, if we wish to enjoy the full advantage which may be derived from grafting. They should be taken from a healthy tree in full bearing, and from the outer side of the horizontal branches of such a tree, where the wood has freely enjoyed the benefit of sun and air. If the tree be in a luxuriant state, the grafts are very properly taken from the extremities of bearing branches; but if it be in a debilitated condition, the most healthy shoots in the centre of the tree should be employed. The extremity of the scion should be cut off, leaving four or five eyes or buds, as the middle part affords the best graft. The most proper season for grafting, in our climate, is from about the twentieth of March, to the twentieth of May, though the operation has succeeded well, as late as the tenth of June, provided the scions have been properly preserved. Practical gardeners, it is said, concur in stating, that the nature of fruit is, to a certain extent, affected by the nature of the stock. Crab stocks, for example, cause apples to be firmer, to keep longer, and to have a sharper flavor. Mr. S. Cooper, of New-Jersey, expresses himself as follows, on this subject: (Dom. Ency. Mease's edit.) "I have, in numerous instances, seen the stock have great influence on the fruit grafted thereon, in respect to bearing, size, and flavor, and also on the dura-

bility of the tree, particularly in the instance of a number of Vandevere apple trees; if fruit of which was so subject to the bitter rot, to be of little use. They were engrafted fifty years ago, and ever since those of them having tops composed of several different kinds, though they continue to be more productive of fruit than any others in my orchard, yet are subject to the bitter rot, the original and well known affection of the fruit of the primitive stock. I have had frequent opportunities of observing the same circumstance, in consequence of receiving many scions from my friends, which after bearing, I engrafted, and the succeeding fruit uniformly partook, in some degree, of the qualities of the former, even in their disposition to bear annually or biennially." Mr. C. has a certain fact that early and late apple by being grafted on the same tree, improved in size and flavor more than if but one kind grew on a tree. It should be observed, as a rule, never to employ suckers from old trees as stocks for grafts, or buds, as they have a constant tendency to generate suckers, and thereby injure the growth of the trees.

From the Concord (Mass.) Gazette.

MY UNCLE PETER'S VIEWS.

"Oh the times! how hard they press
"On a poor farmer in distress!"

Mad Poet.

"If you would be wealthy, think of saving as we as of getting. The mines of South America could not make Spain rich, because her out-goes were greater than her incomes."

Maxims.

I have so often heard the lamentations of farmers over their unhappy lot, as it is erroneously called, that I have been induced to consider them an unfortunate class of the community, suffering more particularly than other men of different professions from the fluctuating state of the times during the last fifteen years. The well known depression in the prices of agricultural products, has tended to produce this opinion and give it general currency. But after comparing the price of the farmers produce and the prices of those articles he must necessarily purchase from abroad for domestic purposes, during the most prosperous times, with the prices of the same articles now, we have data from which we can determine the correctness of this opinion. Not long since, during a conversation with My Uncle on this subject, he informed me, he had made out from his book of "Out-goes and Incomes" of his farm, which he always kept, a list of the various articles sold and bought, and annexed the prices of each at the different periods of 1814 and 1824. I extract the following items:—

Articles sold, in	1814.		in 1824.
Rye, at	\$1.75	per bushel, at	75
Corn,	1.42	"	62
Oats,	.58	"	45
Butter,	.22	per pound	16
Cheese,	.10	"	8
Articles bought in	1814.		in 1824.
W. I. Rum, at	2.50	per gallon,	75
N. E. do.	1.75	"	32
Molasses,	1.67	"	30
B. Sugar,	1.75	per 7 pounds,	67
Loaf do.	.42	per pound,	16
Hyson Tea,	2.75	"	1, 12
Souch. do.	3.00	"	67
Sheeting,	.60	per yard,	16
Shirting,	.42	"	12
Gingham,	.50	"	17
Sattinett,	2.17	"	67

These are important facts and place the subject in a different light from that in which it is generally viewed. A bushel of grain or a pound of butter will purchase, according to this statement, more rum, tea, or cloth now than in 1814 the time when the highest price was given for the farmer's produce.

Our wealth ought to be estimated by the means we possess for happiness; and if an article will procure as much now as formerly, though it might not amount to so many dollars and cents, it shows that a dollar is worth more now than it was then, but it does not show that the times are harder. In estimating the prosperity of business now, it is improper to take into consideration the embarrassments of those who purchased on real estate on credit at a much higher rate than its present value; this is one of the mistakes arising from erroneous calculation. But when a farmer purchases a farm at its present low price, and whether he buy for cash or credit, he can live as independently from the income of the farm as formerly. My Uncle often commiserates those who have to pass that formidable mountain—old debts—but the number of such is comparatively small.

From considerations like these I am led to conclude that, though *Hard Times* may occasionally knock at the door of some farmers, his visits are not occasioned by the low price of his produce, but by some other cause. CHABOD.
Proton, Feb. 6, 1824.

Mr. Leslie's River Glass.—We had intended to notice this simple, but ingenious invention, for the last. It is a tube, that may be varied in length as occasion shall require, about an inch broad at the top, where the eye is applied, and regularly enlarging to the bottom, which is in proportion to the other end, of about 10 inches in diameter. Each end is glazed. The great reason why one cannot look through water to the bottom, is the reflection and refraction of the rays of light upon arriving at the surface. This glass overcomes that difficulty, by extending the eye, as it were, into the clear medium, and making use of the light which is in the water, where the rays pursue straight lines, as well as in the rarer medium of air. For use in the night, it is fitted with lamps suspended near the bottom in a shorter cylinder, which goes on over the top of the tube and descends till the bottom of the tube is as low as the bottom of the tube, where it is secured. In the space between the cylinder and tube, lamps are suspended; the mouth of the cylinder, as well as tube, is glazed. To let off the smoke of the lamps, and supply them with air, two small pipes descend from the top, and the second from the bottom of the cylinder, lead up the side of the tube. The lamps throw a strong light around, and the bottom of the river is easily examined. The correctness of the principle on which the use of this instrument depends, has been fully proved by every swimmer, who has opened his eyes under water, and thus discovered, what, till his eyes were above the water he could not discern. The uses of such an instrument are readily occur. Among other interesting uses, the speedy recovery of drowned bodies is secured, and it would doubtless be the means of

saving many lives. Lost property, too may be found, and the impediments to excavation discovered, and their removal facilitated. The name of the inventor of this River Glass is William Leslie, of Lansinburg, originally from Massachusetts. For a short time past he has been employed in this city. He is well known in this vicinity for his mechanical ingenuity.

[*Troy Sentinel*.]

A very novel but interesting operation was last week exhibited in the Anatomical Theatre at Saint Thomas's Hospital. Mr. Jukes, a surgeon, who invented the apparatus for extracting poison from the stomach nearly two years ago, satisfactorily proved by experiments upon himself the efficacy of the practice, now attended, at the request of Sir Astley Cooper, to repeat the experiment of emptying the stomach by mechanical means. Mr. Jukes chose to be himself the subject of the experiment and was so sanguine of the success of the operation, that he would have swallowed a large quantity of laudanum, had not the entreaties of his friends induced him to substitute a solution of licorice instead. Having swallowed a portion of this solution, and drinking two pints of water, Mr. Jukes introduced a long flexible tube into his mouth and passed it down into the stomach. Mr. Scott, a surgeon, who had formerly performed a similar operation upon this gentleman, immediately fixed a large copper syringe to the extremity of the tube, and in the space of two minutes completely pumped up the whole of the liquid that had been drank into a wash-hand basin held by an assistant. Sir Astley Cooper expressed the highest satisfaction in witnessing the speedy and successful effect of the operation, and the Theatre, which was excessively crowded by professional spectators, rung loudly with shouts of approbation. This public demonstration of the practicability of emptying the stomach by mechanical means though the first made upon the human species, satisfactorily assures the medical profession of the easy application of the apparatus to cases of poisoning, and it is to be hoped, that by the timely use of this invaluable instrument, our public records of accidental and suicidal deaths from poison will happily now be but few.—*London paper*.

Art of Writing.—M. Le Roi has contrived a new and very simple method for teaching the art of writing. A thin and perfectly transparent plate of horn, of the usual size of a leaf of paper, has the polish removed from one of its sides. When laid upon the copy, the hand of a child easily traces the letters upon the unpolished side, which neither absorbs the ink nor allows it to spread. When the whole plate is written over, the ink is washed off with water, and is ready for a new exercise. Thus the same horn which is not liable to break, may serve indefinitely, and by this means produce a great economy of paper—a consideration not to be neglected. Several analogous methods have been adopted both in England and France. Oiled paper, glass, a machine for guiding the pupil's hand, &c. have been used, but it is evident that the method of M. Le Roi has none of their imperfections. The Minister of the interior, who has witnessed the success obtained by this invention, has rewarded the author; and

the societies of encouragement and of elementary instruction, as well as the writing academy, have expressed their approbation of this new process. Mothers may teach their children to write, in the absence of the master, or even dispense with his attendance by the adoption of the horn.—*Silliman's Journal of Science*.

Wild Geese.—When wild geese are tamed, they will join with a flock of domestic geese, but at the usual time of migration, are very apt to join any flock which approaches near them in their passage.—*William's Hist. Vt. p. 136*.

A number of years since, a farmer in Massachusetts shot at a flock of wild geese that was passing over to the south, and broke the wing of one of them. He kept and domesticated the goose, until it was apparently as tame as any one from our common flocks. The ensuing spring he neglected to clip her wings, and she flew away in a flock that was passing to the north, and he conceived her lost. The next autumn, however, when a very large flock was returning to the south, eleven detached themselves and alighted in the farmer's yard. They proved to be one old and ten young ones. The old one was the same that left him in the spring.

[*Hartford Mercury*.]

Vegetable Milk.—In addition to the vegetable bread, vegetable butter, and cabbage tree, which have been brought to light by recent travellers, we now learn by the *Gazette de Santa* of the 25th July last, that M. de Humboldt has discovered in that region a tree which abundantly affords a milky juice, similar in its properties to the milk of animals, and employed for the same purposes. This liquid, which was drank by Humboldt, is stated to be derived from the *palo de lech*, or *de vaca*, a tree which grows abundantly in the mountains above Periquito to the north-east of Maracay, a village to the west of Caracas. The milk possesses the same physical qualities as that of the cow, with this only difference, that it is a little viscous: it has the same taste also as cow's milk.—*Eve. Post*.

Cure for the Foot Rot in Sheep.—Pare the hoofs of the sheep thus affected, letting no hollow remain which may collect the dirt; if matter is formed be particularly careful to let it out. After which take some stale urine and wash their feet with it quite clean, and wipe them with a sponge. Put then the sheep into a house or shed, the floor of which has been previously covered about two inches thick with quick lime reduced to powder by means of a small quantity of water, the newer the lime the better. Let the sheep stand upon it for six or seven hours and the cure will be effected.

[*London Magazine*.]

We once heard of a traveller who told a story of an immense pie,—so large, indeed, that after the crust and meat were eaten, a dozen couples danced in the dish, and one of them lost a buckle in the gravy. Now we cannot boast that Sheffield, has ever produced such a pie, but one was exhibited and eaten at Mr. Turner's on Christmas Eve, of the following size—one yard and a half long, two feet wide, one foot deep, ten feet round. It was baked by Mr. Barlow, quite perfect; the crust consisting of six stope of rye meal.—*Sheffield Inq.*

HON. MR. WELLES ON GRASSES.

TO THE TRUSTEES OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

In the Agricultural Journal of January last I offered some observations on Grasses, and gave the result of an experiment shewing their loss by exsiccation or the process of drying, in the summer of 1822. This subject has been pursued during the past season, and still farther extended. The variation, in the comparison of the two years, is not, it is apprehended, greater, (except in one or two instances which will be explained) than will often occur from the nature of the soil, difference of season, closeness of vegetation, exposure to the sun, &c. &c. As far as a general principle may be established by experiment, it will, in some degree, go to fix the relative value of our natural grasses, as they prevail in our pastures, or of those artificial grasses which should be selected as fit objects of cultivation. In collecting these several species, I have found the natural grasses which generally prevail in this neighborhood, so few in number, that a short and yet sufficient description of them could be most properly first given with advantage.

The earliest grass we have is the *Avena Spicata* (Linn.) or spiked out grass. It is peculiarly indigenous to the United States, and grows, it is said, as far south as Georgia. This grass ripens so early that it mostly sheds its seed, and thus reproduces itself, and is widely propagated. For this reason, as well as from its short growth, it is undeserving of culture, yielding little to the scythe. But it is of great value for early feed in our natural pastures, in which it abounds. One hundred pounds cut on the 15th July last, gave fifty pounds of hay.

The next grass which we shall mention is the *Poa pratensis* (Linn.) with us falsely called Red top, a color it never has. This, both in Europe and America, is the common and prevailing grass of the pastures. It grows in almost every soil and situation, and is one of those materials which is used in Europe for the manufacture of bonnets. The color of its top, or panicle, is of a yellowish brown. The number of florets in the spike vary from three to five.—The seed is sometimes saved and sown; but these fine spired grasses have so minute a seed, that, either from exposure to dampness and fermentation, or some other causes, which it is difficult to prevent or discover, they too often fail of vegetating, by which great injury and disappointment occurs in the wished for crop. Though this grass is amongst those which lose the least in drying, yet, as it presents little to the scythe, it cannot be recommended for culture. It is excellent in our pastures, and comes in naturally as the artificial grasses go out of mowing lots. Indeed it has a preference with our farmers generally, for horned cattle, over every other grass. One hundred pounds cut July 17, gave forty-six pounds. It was past flowering.

The notice of our prevailing natural grasses might here be closed, but as the grasses which we shall next describe appear in our pastures, as well as our cultivated grass land, and are mentioned by several writers in answer to the question proposed by the Society, as to "what natural grasses prevail in this part of the country," we shall give their description here.

The grass here called Rhode Island, is the *Agrostis alba* (Linnaeus) the *Marsh Bent* grass of England, or the *Agrostis Stoloniifera*, Schrader, German. That excellent botanist, Mr. Nuttall, of Cambridge, to whom I exhibited a sample, pronounced it the famous Florin grass of Dr. Richardson and the Irish agriculturists, on the authority of Hooker, who describes "the panicle thereof as purple, and the branchlets patent." The color, at first, of the branchlets is of a deep red, and they adhere closely to the spike, but as they flower they become patent and change to a lighter purple. This grass has six to eight branchlets, and flowers more fully than the *Poa pratensis* though often confounded therewith. It is amongst those which lose least by evaporation, and would be a more favorable object of cultivation were it not liable to the same uncertainty as to its vegetating and producing a crop as the preceding grass, and from probably a like cause. In Ireland it is said to suit a wet soil, and to produce over six tons to the acre. In this country it does not flourish in such soil, nor does it give a great crop, especially compared with the Herds-grass. Still the hay is very excellent, and perhaps not exceeded by any other for its intrinsic value in nutriment. One hundred pounds in early flower, cut July 17th gave forty pounds.

The grass, in the answer given to the Society called Cambridge, Dog and Garden grass, is the *Triticum repens*. Dr. Elliot calls it the "hurtful blue or Dutch grass." In England it is called couch, knot, or dog grass. Every joint of its root produces a new plant, and it is said to be there, as it is found here, one of the worst weeds, and most difficult to extirpate. It resembles wheat, of which it is a species. The best mode to destroy it is to keep the lands longer under the plough, with a frequent use of the hoe, as where this is not done, two years ploughing only not merely multiplies, but occasions it to engross the whole soil. It has a hard woody fibre and is disliked by cattle. It flourishes mostly near cowyards, and gardens, and is called Cambridge from its abounding on the salt banks of the Charles river. One hundred lbs. cut July 22d, in late flower, gave forty-eight pounds.

The grasses above described are those which prevail in our uplands, and are indigenous here. They are, probably, most of them what Doctor Elliot, in his Field Husbandry, denominates English Spear grass, and speaks of as natural to the soil and more hardy. The term *English* has been applied to our upland hay ever since the settlement of the country. These, with the red and white clover, and the varieties which nature, in a course of culture, or otherwise, produces, are what give verdure and fertility to the face of the earth.

Of the cultivated grasses, the first in importance is the Herds or Timothy grass, *phleum pratense* (Linnaeus). Doctor Elliot says "it is a native and early discovered in this country by a man of the name of Heard in Piscataqua." It is doubtless admirably suited to our soil and climate, and not only flourishes in uplands, but may be sowed to advantage in low grounds, especially when drained or raised with gravel or loam. It often attains in height five feet and has been known to produce over four tons to the acre. It does not yield much till the second and third years. For which reason it is

sown with clover, which being biennial and shorter duration gives it space to succeed. This vicinity such is the preference given to that it sells at about one fourth more than any other hay. It lasts with one or two top dressings six to seven years. The answers to the enquiries of the Society as to the quantity seed sown, are two to six quarts. There should not be less seed than half a bushel to an acre which later experience establishes most decidedly. One hundred pounds cut 11th July last gave thirty-nine.

Red clover (*trifolium pratense*) is a valuable grass, when cut green, it affords an excellent nourishment for cattle in the soil process, as well as for swine. When made into hay, cattle are exceedingly fond of it. The flower and leaves are apt to separate from the stem, for which reason great care should be taken that it is not made brittle by too much exposure to the sun. It is best cured as far may be in cock, and should be carted after it dew begins to fall. When properly dried, it is used advantageously, as it may be hous with safety, more green than any other hay. This prevents fermentation and heating, and is kept in better order. Many in this vicinity not only salt their clover, but all other hay. Lord Somerville observes that "he uses half bushel of salt to a ton, and its benefit surpasses all belief producing the best possible effect color, flavor, and general result;" with damaged hay, he says, "it is a great restorative."

The benefit of salt in the culture of the sowing now so generally acknowledged and the use of it so necessary for cattle in the interior or remote from the sea coast, it is difficult to sign a reason why its use is not more prevalent. To land highly manured two to four pounds seed in this neighborhood is used. But in the interior some apply eight pounds and more. One hundred pounds cut July 6th, gave twenty-five pounds.

The white clover (*trifolium repens*), is an bidding grass, sending out roots from every joint forming a close mat on the ground and very excellent for pastures. But it is found to afford so little to the scythe as to discourage the culture thereof. One hundred pounds cut June 26th, gave twenty-seven pounds.

Of the grasses which grow in our meadows two only have been tried. The fowl meadow which Doctor Elliot supposed to have been brought to Dedham by birds said to be the *pennarialis* or marsh meadow grass of England.

It is an excellent grass, and deserving of culture. It is believed however to have extended itself more by its shedding its seed than by any artificial means. One hundred lbs. cut July 23, gave fifty three pounds.

The common grasses of our wet meadows is believed, are various kinds of *carex*. It in all its varieties is a poor grass, and where the land can be ditched and made to produce a better growth, the means should be taken. It is bad economy to flood lands with mere water for a long time to increase a nearly worthless bottom. The effect is to destroy all sweet native tender plants. One hundred pounds cut July, gave forty-four pounds.

The "Marine Fox Tail grass," which is the prevailing grass of our salt marshes we receive from nature without knowing how to aid in

crease. One hundred pounds cut July 18th, gave sixty pounds.

The Black grass (*Juncus Bulbosus*) grows principally where the water is freshened by seams from the uplands. It is the most valuable salt grass we have and but little inferior to stand grass, we know no means of artificial increase. One hundred pounds cut July 18th, gave 33 pounds.

We have too far trespassed on the time the readers to do more than allude to some of those grasses which have been introduced and proved unsuitable for our culture.

The Wild Oat grass (*Avena Elatior*) with the Ray or Durnel grass with which it is said to be confounded, are often seen in our pastures and meadows, but animals seldom touch them. They have a strong woody fibre, and afford little nutriment though well spoken of by us as well as in Europe.

The Burnet scarcely shews itself for a year and then disappears.

The Succory has been praised by Mr. Arthur Young, that distinguished agriculturist who sent to General Washington. It has been introduced here, is disliked by cattle, and has become one of the most troublesome intruders in our fields. These with the St. Foin and Lucerne and many others have passed away and seem to have ceased with us to excite expectation. Of the Orchard grass or cocks foot [*Dactylis Glomerata*] the trials I have witnessed do not enable me to speak so decisively as one of the Trustees, Mr. Prince, does who approves of it.

It may be considered as in a course of experiment.

My desire, Sir, in the preceding, has been to excite an attention to the best means of culture for our grass lands. The process of sowing grass seeds was far from universal with the recollection of many in this country and lamentably insufficient now. Its neglect has been complained of even in Europe. It has been contended that nature would furnish according to her own capacity the power of increase in this particular. Thus the soil was to be furnished with the means of promoting vegetation by labor and art. But here these were stopped and the stimulating principles were to evaporate and be wasted and one or two good crops lost in waiting for this slow process.

But the blindness of this doctrine is vanishing before the light and improvement of the present age. We learn from experience that the earth presents to industry and skill her ceaseless efforts, and never pauses but from our neglect.

Table showing the loss of weight in drying grasses.

	1822.	1823.
100 lbs. of Green white Clover,* gave—	17 1-2	27 1-2
100 lbs. of Red Clover, gave	27 1-2	25
100 lbs. of Herd's Grass, gave	40	39
100 lbs. of Fresh Meadow, gave	38	44
100 lbs. of Salt Grass,† gave	39	60
100 lbs. of 2d crop, or Eng. Rowan, gave	18 3-4	19

* The White Clover of 1822, was taken in the shade. † That in 1823, from a light warm soil exposed to the sun.

† The Red Clover in 1823, was taken in the first year of its product, in close growth and for that reason falls short of 1822.

‡ The Salt Grass of 1822, was, I have reason to suppose, a second growth which accounts for the difference of the two years.

If enabled, experiments will in these cases be hereafter given, so as to fix the result with sufficient accuracy.

	1822.	1823.
100 lbs. of Corn Stalks, gave	25	25
100 lbs. of Spiked Oat Grass, gave	50	50
100 lbs. of Red Top, gave	46	46
100 lbs. of Rhode Island, gave	40	40
100 lbs. of Couch Grass, gave	46	46
100 lbs. of Marine Black Grass, gave	24	24

I am, gentlemen, with high respect, yours,
J. WELLES.

TO THE EDITOR OF THE AMERICAN FARMER.

BUDDING.

Salem, (Ind.) Jan. 11, 1824.

DEAR SIR,—I have practised a mode of budding fruit trees, for some years past, which I do not recollect to have seen described in print; it has succeeded so far very well with me, and may prove new and useful, to some of your readers. It is, budding from cuttings, taken from bearing trees in February, and preserved in boxes of sand in a cellar, until wanted in the same manner as it intended for grafting. They will keep, in this manner, sound, until the middle of June, and perhaps longer, and which may thus be transported to any distance; while cuttings in July, (and buds are seldom mature enough for budding, before that time,) can with difficulty be preserved a few days. As soon as the sap rises freely in the spring, (say the middle of April,) you may commence budding with these winter cuttings, with as much success as at any other time of the year, which may be continued until June or July.—Budding is a neater and pleasanter operation than grafting, and this mode places them upon an equal footing with grafts in March; I continue the wrapping of coarse yarn on, seven or eight days, then head them down, and by the winter, the buds will have grown, (if the season proves favorable) two or three feet in length. I find it an injury to prune the bodies of standards too closely below the buds; the first season, the new bud cannot, (until it has attained the same size,) imbibe and assimilate to itself all the sap that rises, which must, if all the conducting limbs are pruned off, stagnate and disorder both body and roots; will sometimes destroy the stock altogether, or make the body eventually, less than the top or budded part; merely shortening or cutting out too luxuriant shoots. I conceive best, the first summer. In my nursery, I prefer budding on the leading top shoot at the height of four or five feet, as soon as it is three eighths of an inch in diameter; at that height, the juncture of the two growths being more complete in such, than in those of larger growth. One man may bud three hundred in a day, and with an assistant to tie after him, twice that number; in this manner, of those which I bud myself I do not lose five in the hundred.

Your obedient servant,

C. HARRISON.

N. B. I have only attempted budding apples and pears in this way, but have no doubt, it will succeed equally well, with stoned fruit.

ANCIENT AGRICULTURE.

From the earliest accounts of the eastern nations, we have reason to think, that agriculture has at all times been understood by them in considerable perfection; seeing they were always supplied not only with the necessaries, but the greatest luxuries of life.

As soon as the descendants of Abraham were settled in Palestine, they generally became husbandmen, from the chiefs of the tribe of Judah to the lowest branch of the family of Benjamin. High birth or rank at that time did not make any distinction, for agriculture was considered as the most honourable of all employments; witness the illustrious example of Gideon, Saul, and David.

The Chaldeans, who inhabited the country where agriculture doubtless had its birth, carried that art to a degree of excellence unknown in former times. They cultivated their lands with great assiduity, and seem to have found out some means of restoring fertility to an exhausted soil, by having plentiful harvests in succession; on which account they were not obliged as their predecessors had been, to change their situations in order to obtain a sufficiency for themselves and their numerous flocks and herds.

The Egyptians, who, from the natural fertility of their country, by the overflowing of the Nile, raised every year vast quantities of corn, were so sensible of the blessings resulting from agriculture, that they ascribed the invention of that art to Osiris, their chief God. They also regarded Isis, their second deity, as the discoverer of the use of wheat and barley, which before grew wild in the fields, and was not applied by the people to the purposes of food. Their superstitious gratitude was carried so far, as to worship those animals which were employed in tillage; and even to the produce of their lands, as Leeks, Onions, &c.

The divine honours paid to Bacchus in India were derived from the same source, he being considered in that country, as the inventor of planting vineyards, and the other arts attendant upon agriculture.

It is also recorded of the ancient Persians, on the most respectable authority, that their kings laid aside their grandeur once every month to eat with husbandmen. This is a striking instance of the high estimation in which they held agriculture; for at that time arts were practised among that people in great perfection, particularly those of weaving, needle work, embroidery. The precepts of the religion taught by their ancient magi, or priests, included the practise of agriculture: and it was a maxim of the Zendavesta, the oldest book now in the world except one, that he who sows the ground with care and diligence, acquires a greater degree of religious merit, than he could have gained by the repetition of ten thousand prayers.

[Connecticut Courant.

Antidote to Mice.—Mr. Macdonald of Scalpa, after sustaining considerable loss by the depredations committed by mice, thought of placing at the bottom, in the middle, and at the top of each heap of corn, some branches of wild Thyme, and since his stock has been untouched. He found the same success in preserving cheese and other provisions. It may be concluded from thence that it will be easy to drive mice from bake-houses and places where they do mischief, by sprinkling some drops of the oil of Thyme [peppermint] which produces a stronger smell than the plant itself.—*European Magazine.*

Durability of Cedar.—The Farmer's Journal asserts that the durability of cedar is established

by the well attested fact, that in the discovery of a temple of Apollo at Utica, near Carthage, cedar timber, which must have been two thousand years old, was found in perfect preservation. Although cedar trees are not among the natural growth of Great Britain, they are raised in great quantities by cultivation.

COMMUNICATION.

PRESERVATION OF BRIDGES.

An effectual method for preventing Bridges being swept away by extraordinary Freshets.

Let every wooden bridge, in an exposed situation, be loaded with what may be judged a sufficient weight of stones. It will be best to procure long rough stones, split out something like a foot square. Let these be placed against the side fences, where they will prove useful in guarding them from the encroachment of wheels. It will be proper however, that much the largest weight be placed on the side of the bridge exposed to the sweeping force of the current.

J. KENRICK.

NEW ENGLAND FARMER.

SATURDAY, MARCH 6, 1824.

EARLY POTATOES. It is quite an object with Farmers and Gardeners, especially those who reside near a city or other populous place, and calculate on increasing their incomes by carrying a part of their produce to market, to raise potatoes as early in the season as practicable, without too great expense. They thus obtain two or three times as much for the article as they would, had it been brought forward a few weeks later, and confer a benefit on the public, by supplying them in the fore part of summer with an excellent vegetable. Besides, very early potatoes are less liable to be destroyed by drought, insects, &c. and the land may be cleared of them in season for a second crop of some other useful product.

In our paper, volume ii. No. 15, page 117, we gave an account of a successful experiment of Ezekiel H. Derby, Esq. by which he obtained new potatoes of a large size, on the 20th of June, notwithstanding the tops had been cut off by frost on the 3d of May preceding. It is not necessary to repeat Mr. Derby's directions on this subject, as our subscribers have, or should have, the files of the present volume, and can turn to the article to which we allude. The cultivator in making any similar experiment will, of course, choose for his seed potatoes as early a variety as he can procure.

JUDGE BUEL'S REMARKS RELATIVE TO SALT AS A MANURE.

The Editor some time since wrote to Hon. Jesse Buel, of Albany, requesting his opinion as regards the use of salt as a manure. His reply is as follows:

"I have read so many contradictory opinions on the use of salt as a manure, as to leave me very much in doubt as to its value, and I have never had faith enough in its utility to make an experiment, except upon my asparagus bed, and I cannot believe it is likely to come into use on account of expense, even should its utility be established. I have often put to myself the questions, 'If salt be beneficial to soils, why do we not see its beneficial effects within the influence of the sea winds and fogs? Are not these impregnated with saline particles?' I have not been able to solve these questions."

We think however, that salt may be in many cases a useful application to soils, but for the reasons stated in

the first page of this day's paper, we do not believe it ought to be considered, strictly speaking, as a manure.

A Meeting of the Hartford County Agricultural Society, was held in the city of Hartford, on the 17th ult. We are compelled for want of room to defer notice of their proceedings to our next.

FOREIGN.

By a late arrival from Havre, Paris papers to the 15th of January, containing London dates to the 12th, have been received. The London Courier of the 12th states that an expedition of more than 20 vessels, 5 of them of the line, was fitting out at Brest. This assertion was copied into the Paris papers, without remarks. It was stated that the French Ministers had notified the British Ambassador that their sole destination was Martinico and Guadeloupe; but the Courier intimates that they are bound for the Gulph of Mexico.

The Political Constitution of Spain has been abolished, together with all the Provincial and Municipal Assemblies, and all the offices which were created under the Constitution: The Constitutional Militia have likewise been disbanded. The illness of the Marquis Yrujo delayed the organization of the new Government. Robberies and murders are said to be frequent in the interior of Spain.

A strong British expedition was preparing at Malta, to demand the restoration of a number of Greeks, forcibly taken from a British vessel by a Tunis cruiser.

Nothing new from the Greeks. The Turks were preparing for a fourth campaign.

About the last of November between ten and twenty persons were tried at Naples for belonging to a secret society. Of these three were sentenced to be hanged, and to pay a fine of 1500 ducats each; four to twenty years imprisonment in irons, 300 ducats fine, and ten years security for good behaviour, after the expiration of their sentences.

At the last date from Demarara, martial law continued in force, and the infliction of punishment, upon the criminals in the recent conspiracy had not terminated. Numbers were daily flogged, pursuant to their sentences. Some received one thousand lashes.

A Blind Traveller.—Mr. James Hoffman, a man who has been blind since he was twelve years of age, arrived at Irkutsk, in Siberia, on the 16th. He set out from England without any companions, and accomplished the almost, for him, inconceivable task of traveling to Siberia quite alone. What is more extraordinary is, that he speaks hardly any other language than English. He takes a guide from one town to another, and writes down every thing that he can learn, with a machine invented in England, and adopted in many schools.

DOMESTIC.

A letter from one of the Missionaries among the Osage Indians says:—"You have probably before this been informed of the murder of five or six white men by the Osages, who were hunting on their war-ground. I hope that our friends will not be alarmed for our safety on this account. This act has been publicly disavowed by the natives. They never manifested more affection to us or more loyalty towards our government in their previous life."

Extracting Poison from the Stomach.—A British Surgeon claims a valuable invention for extracting poison from the stomach by means of a pump, which elicits the contents of that organ without pain or danger to the person operated on. A writer in the N. Y. Statesman, with the signature "Surgico Medical," says that Dr. Physick, nearly, if not quite ten years since, first suggested this operation, and Dr. Borsey was the first who washed out the stomach, by attaching a catheter to the point of a syringe, in the case of a young man, who took laudanum for the purpose of committing suicide. Mr. Jukes (the supposed English inventor) is said to have known this two years only. I have myself, for more than five years, kept an instrument by me for the above mentioned purpose."

Laudable.—The Connecticut Mirror of the 1st inst., informs that Mr. Samuel S. Stebbins, of Simsbury, pro-

poses to establish an Agricultural School similar to that of Mr. Fellenberg, at Hofwyl, in Switzerland. "The object of the contemplated institution is to give to pupils a competent knowledge of such sciences as are taught in our highest schools as *practically* as possible. For instance, in surveying—the compass, the chain and other tools of science are to be used. A farm is to be attached to the institution, agriculture is to be taught as an art as well as a science, that our farmers may have no more reason to find fault with book-farming. The scholars are to be boarded on the spot, and the industry, their frugality, and their morals will also be practically attended to."

The New York Commercial Advertiser confirms a report which has been circulated but not generally believed relative to two very large ships now building at Quebec. And a London paper of recent date asserts "that a gentleman of Port Glasgow has devised a method of importing timber, which, if successful, will tend to effect very materially its price. The plan is to lay keel 300 feet in length, as for a ship of extraordinary dimensions; upon this base a superstructure of staves is to be reared and the external surface caulked and pitched over. Having prepared the lower part of the keel it is then to be launched; the building is then to be proceeded in a float, forming a solid mass of timber, with the exception of a space for the machinery of two very powerful steam-engines, by which it is intended to propel this huge raft. In this way it is calculated that a single importation may extend to 15,000 tons; a quantity of timber which would require thirty vessels of 500 tons burden to carry. This scheme, it is said, has been submitted to the Committee at Lloyds and received their approbation; and it is added, that the under writers have entered so far into the views of the projector, as to take the risk of the experimental cargo, now in preparation for the voyage from one of our ports in Canada, at the ordinary rate of premium."

Navigating of Connecticut River.—A number of citizens of Hartford, Conn. have associated and taken measures to improve the navigation of Connecticut River. They have chosen a Committee, consisting of David Porter and Eliphalet Averill to enquire into the obstructions of said navigation, who have reported that the decline of business on said river proceeds from sand and gravel bars, the construction of the boats, the falls at Enfield and Brattleborough, and the high rate of tolls paid at the Locks. They state certain methods for removing those impediments, and at the conclusion of their report observe that "the magnitude of the subject astonishes even its projectors, and of its practicability there remains no reasonable doubt."

River on fire.—The Salt Wells on Calf Killer river, in Tennessee, lately took fire. In boring for salt water, the miners struck a vein of sulphureous gas, which escaped through a rock in the bed of the River, and being ignited at the surface, rose in a flame to the height of 40 feet, presenting the singular spectacle of a river on fire.

Extract of a letter from Cincinnati, Ohio, Jan. 27.—"I was astonished on reaching this place to find how extremely cheap the markets are here. We have whiskey at 'three fips' per gallon; partridges at two cents each; chickens at 5; ducks at 6-1-4; geese 20 to 25; turkeys from 19 to 44; some of the latter price weigh 20 pounds; butter 10 to 12 cents; beef 2 to 4. Wood is now selling at from 75 to 87 1-2 cents per cord. The weather resembles that of spring, and we have scarcely felt the winter yet."

Fire.—On the 8th ult. the Woollen Factory, belonging to Buck and Bailey, at Fort Royal, Vir. with all its machinery, and a large quantity of cloth, was destroyed by fire. The loss is estimated at five thousand dollars. The second night after the factory, the dwelling house of Mrs. Buck, at the same place was burnt down.

Fatal Sleigh Ride.—A man named Ross has been committed to jail in Sullivan County, N. Y. charged with the murder of a young man by the name of Conklin. It appears that a party had been out in a sleigh, and that Ross, who was driving, had become intoxicated, and driven out of the road, when Conklin remonstrated with him, and attempted to seize the reins. This so exasperated Ross, that he threatened to kill

A knife was seen in his hand, and immediately Mr. Conklin sprang from the sleigh, exclaimed that was a dead man; he died in fifteen minutes after wound was inflicted.

On Tuesday last, the Supreme Judicial Court commenced their law term for Suffolk and Nantucket, when commission of the Hon. Levi Lincoln, appointing a Judge of said court, was read, and he received, reciprocated, the salutations of the Bench and Bar. Rev. Mr. Sharp offered prayers. At 1 o'clock, the Association attended at King's Chapel to hear an address from the Hon. William Sullivan, their President. This address contained much curious matter of history of the bar, in New England, particularly Massachusetts; a subject which has been but little noted by lawyers, or biographers and historians general.—We are happy that a gentleman of Mr. Sullivan's taste, talents, and research, has turned his mind to Politics, soldiers, and writers of every class, a niche in the temple of fame, while the accretion, and indefatigable lawyer, has scarcely remembered for twenty years after his death.—progress of law—we do not mean the increase of statute book—but of those rules of wisdom and ennobled practice, by which life, liberty, and property are secured, is the progress of intelligence and humaneness. We should say much more upon this admirable address, but it is unnecessary, as we expect to print. At 4 o'clock, the members of the Association sat down, to an excellent dinner, at the Exchange Coffee House provided by Col. Hamilton, in his style. We have been at bar dinners that were indeed—where the black-letter spirit seemed to be presiding genius of the feast, and each one pour-train his wice as a matter of course, but no aspiration came from it. This was otherwise—"soul, sentiment and song," flowed with pure and exhilarating influence, as they should do, when all are friends, and a mention of good feelings the object of the association.—*Boston Gazette.*

A large ox, raised by Mr. Manchester, in Tiverton, slaughtered by Mr. Penniman, in this town, as mentioned, weighed alive 2362 lbs. When dressed quarters weighed 334, 364, 338, 330—weight of 1, 416, hide 139, tallow, 211—total 1766.
[*New Bedford Mercury.*]

Boundary Line.—The American and British Commissioners for settling the boundary line from Lake Huron to the Lake of the Woods, under the 6th article of the Treaty of Ghent, are about as far as Albany. The American Commissioner is Peter B. Porter, the Agent Joseph Delaford, Esq. Barclay is the British Commissioner, and Col. Leighton.

The Government of Canada are taking measures to open a direct trade with India and China, and encouragement for raising Tobacco.

Accident.—On the 8th inst. a boat was upset on Niagara river, when Mrs Stevens, of Lewiston, and her son and daughter, were drowned.

Verdict.—A petit jury in Louisiana, lately tried a man to pay a fine of \$1000 for killing one slave. The Judge informed them that their duty was to decide on the guilt of the prisoners, and not to interfere with punishment which was fixed by law. Nothing, however, would induce them to return a verdict.—*N. Y. Eve. Post.*

Boat Accidents.—We learn from the Mobile Advertiser that the steam boat Osage, from St. Stephens, Ala., cargo of cotton, run upon a snag and sunk; also, the steam boat Columbus, bound down, with 1400 bales of cotton and fifty passengers had struck upon a snag and it was feared she could not get off again.

A steam boat Delaware, from Philadelphia to New York, was run down on Friday morning last, and immediately sunk—passengers and baggage saved.

The New York National Advocate mentions that a man now in confinement in the debtors' prison in New York, has paid for himself and four persons only, the whole amount of whose debts is \$214.

CONGRESSIONAL.

IN SENATE.—Friday, Feb. 20. A memorial from the Legislature of Kentucky, against the Federal Judicial System; and a list of the unproductive Post Routes in the United States were presented and referred.

A bill to authorize a Military road in Louisiana, and appropriate \$30,000 for that object passed. Yeas 23, Nays 8.

A bill on the subject of imprisonment for debt was made the order of the day for Monday.

The bill for the better security of public moneys in the hands of Marshalls, Attorneys, &c. was re-committed, after some discussion, in which Messrs. Mills, Holmes, and Van Dyke bore a part.

Monday, Feb. 23. Accounts from the Indian Department expenditures, and information of the quantity of domestic Hemp used in Cordage manufactures for the Navy were received from the Departments, and appropriately referred.

The bill to authorize the opening and laying out of certain roads in Florida, &c. passed.

The Judiciary Committee having reported unfavorably on the petition of Ebenezer Oliver, and others of Boston, relative to the Yazoo claim, the subject was debated in the House. Mr. Mills moved to reverse the report and spoke at considerable length in support of the claim. Messrs. Van Buren, Holmes, and Kelley supported the Report; but before any question was taken the Senate adjourned.

Tuesday, Feb. 24. A Message of considerable length, relative to the Massachusetts Claim, was received from the President, which concluded as follows: "I therefore consider it as my duty to recommend it to Congress to make provision for the settlement of the Claim of Massachusetts, for services rendered in the late war by the Militia of this State, in conformity with the rules which have governed in the settlement of the Claims for services rendered by the Militia of other States."

Wednesday, Feb. 25. The bill for granting a sum of money to the descendants of the late Col. Laurens was taken up, discussed, but not decided on.

Thursday, Feb. 26. Mr. Mills presented the petition of the legal representatives of the late Gen. Lincoln, and Col. Humphreys, stating that in the year 1789, they were appointed Commissioners to treat with the Indians—that goods intended as presents for the Indians were taken for other uses by the Government, but still stood charged, on the books of the Treasury, to the Commissioners—that orders had been given to commence suits for the amount of these goods, against the representatives of Gen. Lincoln and Col. Humphreys, whose estates have long since been settled. The petitioners pray the intervention of Congress for the equitable settlement of those accounts.—Referred to the Committee on Claims.

The Claim of the New England Mississippi Land Company was again discussed, and after discussion, disallowed.

HOUSE.—Friday, Feb. 20. The Committee on Elections reported that John Bailey, a member from Mass. was not entitled to a seat in the House. Laid on the table.

The resolution of Mr. Owen, for information respecting the operation of the Tariff bill, if passed into a law, on the financial concerns of the United States was taken up, and sustained by Messrs. Brent, Wickliffe, and Garnet, and opposed by Messrs. Mallary, Stewart, Trimble and Ingham. No decision was had on the question.

The House, in Committee, resumed the consideration of the bill for making appropriations for the Military Service of 1824, when the bill having been amended, was ordered to be engrossed. The contingencies were fixed at \$20,000; Armories \$360,000; Ordnance service \$42,000; Pensions to Revolutionary Pensioners \$1,291,716 39; for invalid and other Pensioners \$313,174.

Monday, Feb. 23. The resolution of Mr. Owen calling for information relative to the probable effect of the Tariff bill on the national finances was further discussed.

The Military Appropriation Bill for 1824, passed and was sent to the Senate.

Several Messages were received from the President. 1st. on the Massachusetts Claim; 2d. respecting

Scott's Army Regulations; 3d. respecting the boundary line of Arkansas; and 4th, relating to expenses, which would be incurred by transporting 200 of the troops now at the Council Bluffs, to the mouth of the Columbia or Oregon river.

Tuesday, Feb. 24. This day was occupied in discussing the Tariff bill, but no decision was obtained.

Wednesday, Feb. 25. A report on Lambert's Explanations of his Astronomical Observations, &c. for establishing the Longitude of the Capital was made and laid on the table.

On motion of Mr. Sibley, of Mass. the Committee on Agriculture was instructed to inquire if an increase of the duty now established by law on any article of foreign growth or manufacture will be for the interest of the agriculturist, and if there be any such article to name the same, together with the additional amount of duty which they deem beneficial to the agricultural interest.

Thursday, Feb. 26. This day was mostly occupied in discussion, relating to the Tariff.

NEW TOWN OFFICE.

JUST published by DORR & HOWLAND, A new Town Office, Containing the General Laws of Massachusetts relating to the Choice, Powers, and Duties of Town Officers arranged under their respective titles.—For sale at their Bookstore in Worcester, and by RICHARDSON & LORD, Boston. Worcester, March 1, 1824.

THE MANSION OF PEACE.

As I stood on the hill that o'erlooks the dear cot
Where my Kate and my little ones dwell,
I said, if the splendor of kings were my lot,
I'd prefer my own daisy grown dell.
Though humble my wicket, and shatter'd my latch,
And the winds my rude lattice have rent,
Though my mansion is low and all covered with thatch,
'Twas the mansion of peace and the home of content.

'Though twelve weary months have now wasted away,
Since my Kate and my cottage I left,
Though the hardships of fate I've encountered by day,
And of sleep I've at night been bereft;
Yes oh! if my Kate and my little ones live,
Should they smile with the blessing of health,
'The hardships of life I'll forever forgive,
For in them I've a world full of wealth.

As I spoke I beheld my love Kate at the door,
And my little ones played by her side,
Let the tempest come on, let the wind loudly roar,
In the moment of madness I cried;
No longer I paused in a transport so true,
For never seem'd mortals so blest,
To her dear open arms I instantly flew,
And let those who have hearts speak the rest.

At eve my dear little ones clang round my knees,
As I kissed them a thousand times o'er,
What rapture I cried can be equal to these!
'Tis heaven alone can give more—
Though humble my wicket and shatter'd my latch,
And the winds my rude lattice have rent,
I find in my mansion that's covered with thatch,
Still the mansion of peace and the home of content.

MISCELLANY.

Look not thou upon the liquor when it sparkles, when
it giveth its color in the cup, when it moveth itself
aright: at the last it biteth like a serpent, and stingeth
like an adder."—**SOLON.**

Would you learn how like a serpent drunkenness biteth and how like an adder it stingeth, then contemplate the disgusting figure and the deplorable circumstances of *Silenus*.—Behold this miserable wreck of a man!—He is not yet turned of forty, yet totters in his steps, like one of four score.—See him weakened in intellect, morose in temper, lost to all sense either of honour or shame, lost to all affection towards the wife of his bosom and the children of his own body.—Mark the stupidity of his countenance, the morose aspect of his blood shot eyes, his palsied hand, and the leprous tetter that covers his skin.—Turn now and behold his wife—there she sits in that corner, covered with a thin tattered robe and shivering over a handful of coals.—See her pale and emaciated—her eyes dim with weeping and her cheeks furrowed with tears.—Happy woman! who can but pity thee? who can but mingle his tears with thine?—Look next on those suffering children.—They receive nought but frowns and curses and blows from the man whom they had been taught to call by the endearing name of father; yet they have a friend whose bosom throbs with tenderness towards them; but her hand is too feeble to supply their needs.—They ask their mother for bread, but she has none to break for them.—The storm howls through the broken windows and they say, "we are cold?" she answers them only with sighs. Alas! she has none to bind up

her own bleeding heart.—And is this the once sensible and sprightly *Silenus*, fortune's child, who inherited a large patrimonial estate, whose pockets were lined with gold?—Is that too the once gay and beautiful *Philenia*, the delight of her parents, the joy and the life of the social circle?—Is this the pair that commenced the conjugal state with prospects the most flattering?—The same.—"How fallen, how lost!" And what has wrought this terrible reverse in their circumstances? What has turned this man into a brute? What has plunged this woman into the deepest distress, inasmuch that her tears are her meat? What has rendered these children miserable? What fiend has poisoned and destroyed the happiness of this whole family!—That cursed fiend is drunkenness.—Time was when *Silenus* was a kind husband and an affectionate father, when his company gladdened the heart of his wife, when his little prattlers used to meet him at the door and received his fond caresses.—Time was when every room in this mansion was gilded with domestic happiness, when he ranked in society as a useful member and an ornament, and when the eye that saw him, blessed him, and the ear that heard him was respectfully attentive.—But *Silenus* looked on the sparkling liquor, while giving its colour and temptingly moving itself in the cup—he tasted, he at length sipped daily; the habit became riveted—he plunged occasionally into intoxication, and from occasional intoxication, he at last became a downright sot.—His estate is consumed, and of all poor people, his family are among the most wretched.—"Dig they cannot," having never been taught to labor—"to beg they are ashamed!"—This is not a romance;—there are many families in our country, whose deplorable situation corresponds with this description.—*Con. Courant.*

A WOMAN CAN KEEP A SECRET.

The following anecdote will prove the fallacy of the remark, that "a Woman, cannot keep a secret."

Some years since, a lady called at a glover's shop in the outskirts of the town, and purchased a pair of gloves for her immediate wear; observing, at the same time, she was on her road to Burnet—that she had left her gloves at her friend's house, where she had called, and that she was apprehensive of being benighted if she went back for them. The glover fitted on the gloves; and the lady, after paying for them from a purse well stocked with bank notes, stepped into her post chaise, and proceeded on her journey. She had scarcely reached Finchley Common, when a highwayman stopped the chaise, and demanded her money. He intreated her not to be alarmed, as he had no intention upon her person—if she surrendered her property, it was all he wanted, declaring, that distress, and not his will urged him to this desperate act, and he was determined to remove his penury, or perish. The lady gave her purse, and the desperado rode off.

After he was gone, and the fright had subsided, the lady imagined, that, in the address of the highwayman, she recognized the voice of the glover she had just before dealt with. This conceit struck her so forcibly, that she ordered the post-boy to drive back to town—not choosing, she said, to venture further over the heath.—On her arrival at the glover's she knocked and gained admittance, the glover himself opening

the door. The lady desired to speak with him in private. The glover shewed her to a boudoir; when she exclaimed, "I am come my purse, of which you robbed me this even on Finchley Common!"—The glover was confounded; and the lady proceeded—"It is of use for you to deny it: I am convinced, your life is at my mercy. Return me my property, and trust to my humanity."—The glover overcome with guilt, shame and confusion, turned the purse, confessed the crime, pleaded his distress. The lady, after suitable admonition, gave him a ten pound note, by him mend his way of life, and keep his counsel; adding that she would never divulge his name or place of abode. She kept her word: and, though the robbery was stated in the public papers, the discovery was omitted and it was not until very recently, that a recital of this singular transaction was found among the papers of the lady alluded to: Even this private memorandum, the name and residence of the glover was omitted; and the scene in that particular, rests with the lady in grave.

After this tale, the truth of which may be relied on, who will say that a woman cannot keep a secret?

ADVICE TO YOUNG MEN.

There is no one thing that is so important to a young man that is just entering on the stage of life, as the choice of company; every thing a great measure depends upon that. The cunning rakes and dissipated fops may have the allurements, but above all things, young men beware of them. They entice but to ruin, and who is weak enough to be led into their snare may be sure of meeting with nothing but disappointment, chagrin and the loss of health and an empty purse.—Therefore, it is of the greatest consequence, to choose suitable company to associate with.

Many imagine that they shall not be considered gentlemen without they swear roundly, drink down their bottle of wine, and smooke their dose of segars at a sitting; but mistaken young men beware how you indulge yourselves in such vicious practices; for depend upon it, if you do on thus by degrees into vice, your fame and health, will pay dear for your idle revels, and noisy carousals, you make the moments of time appear to pass with swiftness, but recollect that every fleeting moment brings you nearer to that bourne whence no traveller returns. M.

Idleness.—Epaminondas, Prince of Thebes, had such hatred for idleness, that finding one of his captains asleep in the day time, he slew him. For which act, being reproved by his noble repel, "I left him as I found him;" thus sparing idle men to dead men.

REMARKS ON VEGETATION, &c.

TO PRODUCE SEEDS EARLY IN THE SEASON.—Those seeds, which are required to yield a forward crop, as the peas and beans of our gardens, may be sown before the commencement of winter, either in natural ground, as in the cultivation of heat, or in situations sheltered from the cold winds of winter. Or they may be sown very early in the spring, and very thick in hot-beds, or under hot bed frames, or under warm walls, and be transplanted, when they are one or two inches high, into the natural ground, at the distances, when the weather is milder, and the plants are become hardier.

When young plants of any kind are transplanted, the ground should be fresh dug, as their rapid growth depends so much on the atmospheric air being buried in the pores or interstices of the earth, by the production of carbonic and nitrous acids and ammonia, and heat. Dr. Darwin says that "the wheat produced on land has been much limed, is believed to be thinner skinned, and to produce more good meal than any other wheat, and to make better bread. On this account I suppose that one use of lime is to forward the ripening of seeds by inverting their mucilage sooner into starch oil; as according to the experiments of Mr. Rmentier, the goodness of bread depends much on the quantity of starch contained in it; no found that if the starch taken from eight pounds of raw potatoes, by grating them into cold water, was mixed with eight pounds of boiled potatoes, a good bread might be produced from wheat flour."

The same writer says, "it is well known to gardeners that transplanting garden-beans forwards them in respect to time, but shortens the height of the stem. Hence transplanted vegetables grow less in height, as transplanted beans; and less branchy, as transplanted melons; which is a great advantage.

"To generate the best kinds of seeds the most healthy plants must be chosen, and those which are most early in the season; these could be so insulated as to have no weak plants of the same species, or even genus in their vicinity, lest the fecundating dust of weaker plants should be blown by winds upon the stigma of the stronger and thus produce a less vigorous progeny.

"When new varieties are required, the malest of one good variety, as of the nonpareil apple, should be shed upon the stigmas of another good variety, as of the golden pippin; and it is probable that some new and excellent varieties might be thus obtained.

Mr. Knight has given a curious experiment of impreginating the stigmas of the pea-blossoms of one variety with the farina of another. He says, *Treatise of Apple and Pear*, p. 42. Blossoms of a small white garden pea, in which the males had previously been destroyed, were impregnated with the farina of a large colored kind with purple blossoms. The produce of the seeds thus obtained were of a dark grey color, but these having no fixed habits, were soon changed by cultivation into a nume-

rous variety of very large and extremely luxuriant white ones, which were not only much larger and more productive than the original white ones, but the number of seeds in each pod was increased from seven or eight, to eight or nine, and not unfrequently to ten. The newly made grey kinds I found were easily made white again by impregnating their blossoms with the farina of another white kind.* In this experiment the seeds, which grew toward the point of the pod, and were by position first exposed to the action of the male, would sometimes produce seeds like it in color, whilst those at the other end would follow the female.

In other instances the whole produce of the pod would take the color of one or other of the parents; and I had once an instance in which two peas at one end of the pod, produced white seeds like the male, two at the other end grey ones like the female, and the central seeds took the intermediate shade, a clay color. From some very imperfect experiments I have made, I am led to suspect that considerable advantages would be found to arise from the use of new or regenerated varieties of wheat, and these are easily obtained, as this plant readily sports in varieties, whenever kinds are sown together.

"The white and blue peas sown in fields as well as in gardens sometimes possess the property of becoming soft by boiling, at other times not. This circumstance is said to depend on the nature of the soil, but has not yet sufficiently been investigated; perhaps the greater or less maturity of the peas at the time of gathering them may have more or less contributed to fill their fibrous cells or divisions with mucilage or starch. The greater or less mealiness produced by boiling potatoes seems to be an analogous circumstance, and is thought by some to arise from the nature of the soil rather than from the species or variety of the planted root.

"The mealiness of some boiled potatoes, and the softness of some boiled peas, may be occasionally affected by the acidity of the spring water in which they are boiled, but is generally, I suppose, owing to the mucilage of some of them being more or less coagulable by heat than that of others. Something similar to which obtains in animal mucus, as the chrysaline humor of the eyes of fish, becomes hard and opaque by boiling; while the skins of ani-

* The Domestic Encyclopedia says that "the manner of obtaining the farina of plants for microscopical observation is this—gather the flowers in the midst of a dry sun-shiny day, when the dew is perfectly off, then gently shake off the farina, or lightly brush it off with a soft fair-pencil, upon a piece of white paper;—then take a single tale of isinglass between the nippers, and breathing on it apply it instantly to the farina, and the moisture of the breath will make that light powder stick to it. If too great a quantity is found adhering to the tale blow a little of it off, and if there is too little breathe upon it again and take up more. When this is done put the tale into the hole of a slider, and applying it to the microscope, see whether the little grains are laid as you desire, and if they are, cover them up with another tale, and fix the ring, but care must be taken that the talcs do not press upon the farina in such a manner as to alter the form."

mals, and the tendons of their feet, become a soft mucus or jelly by boiling, and some of the liquids, which are found in the cells or cavities of the body in dropsies, are observed to coagulate by heat, and others to become more fluid. The causes of this difference merit further enquiry.

To collect good seeds consists not in procuring seeds from distant places, as is generally supposed, but in selecting the best seeds and roots of your own. Mr. Cooper, of New Jersey, was led to this practice, which he began more than sixty years ago, by observing that vegetables of all kinds were very subject to change with respect to the time of coming to maturity, and other properties, but that the best seeds never failed to produce the best plants. Among a great number of experiments, he particularly mentions the following:

"About the year 1746, his father procured seeds of the long watery squash, and though they have been used on the farm ever since that time without any change, they are at this time better than they were at the first.

"His early peas were procured from London in the year 1756, and though they have been planted on the same place every season, they have been so far from degenerating, that they are preferable to what they were then.—The seeds of his asparagus he had from New York in 1752, and though they have been planted in the same manner, the plants are greatly improved.

"It is more particularly complained of, that potatoes degenerate when they are planted from the same roots in the same place. At this, Mr. Cooper says, he does not wonder when it is customary with farmers to sell or consume the best, and to plant from the refuse; whereas, having observed that some of his plants produced potatoes that were larger, better shaped, and in greater abundance than others, he took his roots from them only; and the next season he found that the produce was of a quality superior to any that he ever had before. This practice he still continues, and finds that he is abundantly rewarded for his trouble.

"Mr. Cooper is also careful to sow the plant from which he raises his seed at a considerable distance from any others. Thus, when his radishes are fit for use, he takes ten or twelve that he most approves, and plants them at least one hundred yards from others that blossom at the same time. In the same manner he treats all his other plants, varying the circumstances according to their nature.

"About the year 1772, a friend of his sent him a few grains of a small kind of Indian corn not larger than goose shot, which proceeded from eight to ten ears on a stalk. They were also small, and found that few of them ripened before the frost. Some of the largest and earliest he saved, and planted them between rows of a larger and earlier kind, and the produce was much improved. He then planted from those that had produced the greatest number of the largest ears, and that were the first ripe, and the next season the produce with respect to quality and quantity was preferable to any that he had ever planted before.

"Many years ago Mr. Cooper renewed all the seed of his winter grain from a single plant; which he had observed to be more productive, and of a better quality than the rest; which he is satisfied has been of great use.— And he is of opinion, that all kinds of garden vegetables may be improved by the methods described above, particular care being taken that different kinds of the same vegetables do not bloom at the same time near together;— since by this means they injure one another."

"2. As the varieties of plants are believed to be produced by different soils and climates, which varieties will afterward continue through many generations, even when the plants are removed to other soils and climates, it must be advantageous for the agriculturist to inspect other crops as well as his own; and thus, wherever he can find a superior vegetation, to collect seeds from it, which is more certain to improve his crops, than an indiscriminate change of seed."

"But where seed corn is purchased without a previous observation of its superior excellence, perhaps it would be more advantageous to take that from better kinds of soil, and from somewhat better climates; as the good habits acquired by such seeds may be continued long after their removal to inferior situations. And on the contrary, care should be taken not to collect a change of seeds from worse climates or inferior soils, unless the agriculturist is previously certain that they are of a superior kind."

(To be continued.)

ON GRAFTING FRUIT TREES, &c.

In our last paper, page 250, we published some remarks on this subject from Dr. Thacher's *Orchardist*; and the following observations may be considered as connected with, and form a continuation of that article.

"The proper tools and other materials for grafting, are: 1. A strong knife for cutting off the heads of large stocks, previous to the insertion of the graft; also a small hand saw, for occasional use, in cutting off the heads of large stocks; 2. A common grafting-knife, or strong sharp penknife, for cutting and shaping the grafts ready for insertion; also to slope and form the stocks ready for the reception of the scions; 3. A flat grafting chisel, and small mallet, for clefting large stocks in cleft-grafting; 4. A quantity of new bass strings, for bandages for securing the grafts, and promoting their speedy union with the stocks; and 5. A quantity of clay, for applying closely round the grafts after their insertion and binding, to defend the parts from the influence of the sun, winds and wet weather, or from being affected by cold. For this purpose, a kind of stiff loamy mortar may be prepared of strong fat loam, or any other tough clay may be substituted; to which may be added a fourth part of fresh horse dung, free from litter, and a small portion of cut hay, with a little water, well mixed: the whole should be properly beaten with a stick, and thus incorporated."

"This operation should be repeated, according to the nature of the clay, and performed several times during the first day; the composition being still moistened with water for six or seven days successively, at the end of which time it will be fit for use.* This composition should be

applied closely round the parts in form of a collar or ball, tapering at both ends, the upper end being applied to the graft and the under to the stock. A good substitute for the above is a composition of turpentine, bees wax and rosin melted together; if it prove too hard, it may be softened with a little hog's lard or tallow. This may be applied with a brush while warm but not too hot.* A writer for the Massachusetts Agricultural Repository, vol. v. page 126, says "the compost best suited to cover the wounds of all trees is a composition of tar, bees wax, and red ochre, boiled or simmered for half an hour or twenty minutes together. The proportions which I have used are a pint of tar into which I put a piece of bees wax as big as an English walnut; when these are incorporated, I scatter a small quantity of pulverized red ochre say half a gill, and stir them well together, while boiling hot or simmering. When this compost is cool it should be stiff enough to resist the heat of the sun sufficiently to prevent its running, yet soft enough to be applied to the wound with a small, flat smooth stick; it will last two years at least, without requiring to be renewed; it yields to the sap as it issues from under the band round the wound to cover it, while it continues to protect both the wood and the edge of the bark from water, and of course from decay."

Mr. Abner Landrum of South Carolina, says that turpentine, when mixed in the proportion recommended, is injurious as a composition to be used in grafting. He observes "whatever may be the innocence of a wax containing one third turpentine in a northern climate, I was so well convinced from my trials of its deleterious effects in Carolina as to reject it entirely. After many experiments to ascertain the best composition for a grafting wax, I prefer the following:—One measure of olive oil, or hog's lard 3 do. of melted bees wax; mix well while hot to be worked after it is cool, till sufficiently pliant."†

The following modes of grafting are the most common, and successful.

"1. *Whip-grafting, or tongue-grafting* is generally performed in nurseries, upon small stocks from a quarter of an inch to half, or a whole inch in diameter. The stock, and scions or grafts should always be near to the same size as possible. They are both to be sloped off a full inch or more, and then tied closely together. This method may be much improved by performing what gardeners call *tonguing or tipping*: that is by making an incision in the bare part of the stock, downwards, and a similar slit in the scion upwards; after which they are to be carefully joined together, so that the rinds of both may meet in every part, when a ligament or bandage of bass is to be tied round the scion to prevent it from being displaced; and the whole to be covered over with the composition."

Cleft-grafting or slit-grafting as gardeners differently term it, is performed upon stocks from one to two inches in diameter. The head of the stock being carefully cut off, in a sloping direction, a perpendicular cleft or slit is to be made, about two inches deep with a knife or chisel, towards the back of the slope, into which a wedge is to be driven, in order to keep it open for the admission of the scion: the latter must now be

cut in a perpendicular direction, and in the form of a wedge, so as to fit the incision in the stock. As soon as it is prepared it should be placed the cleft in such a manner that the inner bark of both the stock and the scions may meet exactly together. It is then to be tied with a ligature of bass, and clayed over, as is practised in whip-grafting, three or four eyes being left in the stock uncovered." Care should be taken in making the cleft in the stock, not to injure the pith; the scions being inserted in the sap wood of the stock. "Cleft-grafting says the Farmer's Assistant, "may be successfully performed on trees where the fibre of the outer bark runs round such as the peach, plum, cherry, &c. by cutting through that bark with a knife, at a place where the cleft is to be made, and in the same direction it is expected to run; when the rest of the operation may be as easily performed as in other trees."

Grafting in the rind, according to the same work, "is performed by cutting off the stock square; slitting down the bark a small distance and raising it up, so that the end of the scion may be inserted between it and the wood: The scion is made with a shoulder, cut in about half its thickness, and the other half is sloped off gradually, so as to give it the form of a wedge; the cut side being flat and the bark side untouched. This wedge or tongue is inserted under the bark with the shoulder fitted to the stock; the rind of the bark is then pruned close, and bound round with the composition applied. It is usual in this case to insert three or four scions in the same stock." This sort of grafting is called by old writers *crown-grafting* and is thus described Dr. Thacher. "The head of the stock or the branch is cut off horizontally; a perpendicular slit is made in the bark as in budding; a narrow ivory folder is thrust down between the wood and bark, in the places where the grafts are to be inserted. The graft is cut at the distance of an inch and an half from its extremity, circularly through the bark, not deeper than the bark on one side, but fully half way through or beyond the pith on the other. The grafts being pointed and a shoulder left to rest on the bark of the stock they are inserted into the openings, and either three or four grafts are employed, according to the size of the crown."

"*Side-grafting*," says the same author, "is sometimes employed for supplying vacancies in the lower parts of full-grown fruit trees. The bark and a little of the wood are sloped off to the space of an inch and an half, or two inches; a slit is then made downwards, and a graft is cut to fit the part, with a tongue for the slit; the parts being properly joined, are tied close and clayed over. When stocks cannot readily be procured, *root-grafting* may be successfully employed. A piece of the root of a tree of the same genus, well furnished with fibres, is selected, and a graft placed on it, tied and clayed in the ordinary way. Thus united, they are set with care in a trench in the ground, the joints being covered, but the top of the graft being left two inches above the ground."

(To be continued.)

CELLARS.

In Germany, vaults are so constructed that canal, or passage of communication, is opened from the cellar to the principal chimney of the house. A communication should be made be-

* Thacher's Orchardist.

† See New England Farmer, vol. i. page 145.

each cellar (where there are more than one) by means of an opening over or near the ceiling, and next the ceiling, three feet long and two feet deep. A circulation of air would thereby be effected, and for security parallel bars may be placed in the openings. By this means, the cellars may be continually vented, so as to expel the damp and noxious vapors, which are usually collected in them; the draught of the chimney is, in a considerable degree, promoted.

The dangers arising from the sudden, or frequent inhalation of such air as is often generated in close and damp cellars, have already been noticed; together with the most proper method of obviating its deleterious effects.

[Domestic Encyclopedia.]

TO THE EDITOR OF THE AMERICAN FARMER.

ON THE MANAGEMENT OF FRUIT TREES.

DEAR SIR,—Having seen, in your valuable paper, many useful remarks on the treatment of fruit trees, and as the season is at hand, when it is usual to trim them, wash, &c. I beg leave to add in my mite to the general stock, and to test against that too common practice of whitening the trees, as it is, in my opinion, attended with the worst consequences. It is done under the impression that the caustic quality of lime will destroy the insect—were it to end there, I would cordially approve of the application.—It will not only destroy the insects, but the trees also, by stopping up the pores of the bark, thereby preventing the absorption of the gases that are as essential to preserve, and promote vegetation; as it is necessary, in the human system, to keep open the pores of the body, to preserve health and vigor, how much would a man continue healthful, were his body to be incrustated with a thick paste? For many years, given considerable attention to the management of fruit trees, and am convinced, cleanliness is as important to them, as to the human family. This is to be produced by scraping off the moss and old bark, and washing with soft soap and water in which tobacco has been steeped, during a moist spell of weather, in the months of February, or March. The taking off the moss and bark serves to expose the insects and their eggs to the sharp frosts, that are usual at that period of the year.—The soap suds soften the bark, open the pores, assist in destroying the insects, and act as a stimulant. I have used all kinds of manures as a dressing to the trees, and have never found any to equal tobacco. It not only is active in its operation, but will effectually kill all insects and mice from the roots—other manures attract them.

I am unwilling to occupy your time by giving detail of my experiments—I will, however, mention to you one fact, in confirmation of my opinion of the utility of keeping open the pores of the bark.

Contiguous to my garden, I have a small orchard, and have had for several years past, the openings of the walls and the weeds from the trees thrown into a heap, between a row of apple trees, which served, when rotted, as a dressing for the small seeds sown in the open.—The trees nearest the heap far outstripped the others, and those limbs immediately over it, were of a much more luxuriant

growth; and, as if anxious to inhale every exhalation from the weeds, inclined towards and bent over them, instinctively impelled to seek for nourishment, which was received through every pore, and which could not have been imbibed, had the trees been covered with a thick crust of lime, by white washing.

A friend to Pomona, D. W. Jr.
Baltimore County, Feb. 25, 1821.

From the Connecticut Mirror.

The Columbian Coffee of Mr. Edmund Rogers, of New London, Connecticut, like every other great invention, was, at first, modestly vended on a humble scale, and patronized, only by his neighbors and friends. The Mayor and Alderman of his native town, and the British Consul, resident there, were its first patrons. The celebrated Dr. Mitchell, of New York, his Excellency Governor Wolcott, and his Excellency De Witt Clinton, afterwards tried, and vouched for its virtues. The seal of genuine recommendation is, at last placed upon it, by him of Monticello. The partiality of the proprietor, for his own country, prevents his applying to the Holy Alliance; and the friends of the Tariff, will, no doubt, exempt the exportation of this article, from any additional duty in return. The discoveries of Franklin, and the inventions of Fulton, were once in their infancy, and were brought into notice, by the patronage of the great. But pleasantry aside, it is gratifying to him and his friends, and must be satisfactory to the public, to find the Columbian Coffee spoken of as it is, in the following letter from Mr. Jefferson, which we copy from the original:

"Monticello, Feb. 14, 1821.

"Sir,—Your letter of November 20th, being in the box with the Columbian Coffee, did not come to hand 'till the 7th inst. I thank you for the specimens sent me; and as you have requested my opinion of it, duty to you, as well as to myself, requires, that it should be done with truth and candor.

"The coffee bean, from its mild and smooth bitter, its essential oil, and the Aroma that gives it, is become the favorite beverage of the civilized world. Many attempts have been made to find substitutes for it, trying, chiefly, vegetable substances. They have succeeded in furnishing a bitter, but never the peculiar flavor of the bean. As to the bitter, the chick pea is the best substitute I have ever tried. I have heard much said of the Succory root, but never tried it.

"I do not know what is the basis of your substitute: its bitter is well, and I should really prefer it to the green Coffee, so much the taste of this country; but there I must stop. The genuine, well ripened Coffee of the West Indies, that of Java, of Bourbon, of Moka, rise in different degrees of superiority over it; but I repeat, that it may, advantageously, enter into competition with the Green Coffee. Byran Edwards tells us that that is gathered from the plants which are so late, as that the cold season catches them before they are ripened: of consequence, their oil is still crude, and the fruit itself, like all other green fruit is sourish. It was formerly considered among the offal of their plantations; never offered at market, until they found that the Americans would give

something for it: its cheapness gave it vogue here, until habit fixed a taste for it, and has raised its price to that of the ripe bean. Cheapness ought, in like manner, to give a preference over that to the Columbian Coffee, and the rather, as it is entirely clear of the sourish tang of the green bean. Could it take the place of the green alone, it would become an important national economy.

"I have done with your specimens, what I thought best for your interest, by giving five of the six papers you sent me, to as many Grocers and Merchants of the neighboring village of Charlottesville, that they may open dealings with you in the article if they think proper.—One of these is from your state, a Mr. Huntington of the family of that name with you, and to whom you can address a letter if you think it worth while.

"Accept my respectful salutations.

"TH. JEFFERSON.

"Mr. Edmund Rogers, New-London, Conn."

From the London Farmer's Journal.

ANSWER TO THE QUERY ON TURNEPY BUTTER.

Shropshire, Dec. 17, 1823.

SIR,—Observing in your paper of Monday, the 15th inst. a letter from *A Small Farmer* wishing for information how to remove the unpleasant taste of turnepy butter, I send you the following recipe which I got from a friend, and which I have tried.

To every pail of milk immediately after it is taken from the cow, pour a quart of boiling water, and so in proportion to any smaller quantity, taking care to stir the milk with something for a few minutes, when the taste will evaporate. I should observe that this process rather weakens the flavor of the butter; the quantity of water, however, may be regulated according to circumstances.

Many friends of mine have failed by not seeing that the process is *exactly* followed, servants in general not being inclined to do more than they can help.

I am, Sir, your obedient servant,
OBSERVER.

Excellent Spruce Beer.—Pour eight gallons of cold water into a barrel, and then, boiling eight gallons more, put that in also; to this, add twelve pounds of molasses, with about half a pound of the essence of spruce; and on its getting a little cooler, half a pint of good ale yeast. The whole being well stirred, or rolled in the barrel, must be left with the bung out for two or three days, after which the liquor may be immediately bottled, well corked up, and packed in saw dust or sand, when it will be ripe and fit to drink in a fortnight. If spruce beer be made from the branches or cones they must be boiled for two hours, then strained into a barrel and the molasses and yeast added as to the essence.—*Eng. pub.*

A Wonderful Grain of Wheat.—One grain the first year produced a stem containing 11 ears, each ear averaging 87 grains; the second year produced half a bushel; the third year 20 bushels; the fourth year 768 bushels, or 26 quarters! This *marceau* is making, with great industry, the circuit of the papers.—A Mr. Labor, of Essex, the grower of the corn; and a Mr. Smith of Mark-Lane, the voucher of the fact.—*ibid.*

From the Massachusetts Agricultural Repository.

[The following communications were made by sundry gentlemen who were competitors for the premiums on Agricultural Productions, but did not obtain them, owing to the greater success of others. We thought it but a proper piece of respect to them to publish their communications.—By them the public will learn also that the zeal and skill of our farmers is extensively diffused.]

ON INDIAN CORN.

In July 1821, after mowing the piece of land containing about one and three quarters of an acre, I ploughed and planted the same with Virginia Corn for fodder, using about ten loads of yard manure in the hill, and hoeing it once, I commenced cutting and giving them to my cattle the first of October, at which time they began to tassel; after using them all, I again ploughed it. In the spring of 1822, twice ploughed the ground after spreading about twenty-five loads of green barn manure and putting a shovel full of manure in each hill, procured from the yarding of ten cows and five hogs together, drawn out of the yard into a heap the fall before, I planted with corn and pumpkin seed. I discovered in July that the corn was suffering great injury from the pumpkin vines, by their running up the corn and shading the ground by covering it in such a manner, that if there was no corn upon the ground, it would have been completely covered with pumpkin vines, it finally produced sixty bushels to the acre, of corn, and a few loads of pumpkins. After harvesting I again ploughed it, and in the spring of 1823, I ploughed it three times and harrowed it as often, previously spreading about twenty-five loads of green barn manure, then furrowing about three feet apart each way I planted with five kernels of yellow and red eight rowed corn, putting a shovel full of yard manure in each hill, produced from yarding the above mentioned stock, a sufficient quantity of loam being usually carted into the yard, as would increase the whole to about one hundred loads, all which was used upon that 1½ acres, and another containing one and a half acre, which is nearly if not quite as good as the acre which is represented, being cultivated with equal expence of manure and labor, finished planting all my corn prior to the tenth of May, to which cause I attribute solely the success which I have in the crop over former years, having been at less than half the expence in hoeing than when I planted in rows for the three last years, and having not using any greater quantity of manure in neither of which years did not finish planting corn until the last week in May, it being commonly said it would not do before the season was so far advanced as not to be liable to cold storm; by the first of July I had finished hoeing corn three times rather lightly, not making much hills nor ploughing among it but little, cut no suckers although very many, except a few hills which appeared any better for it, on the 27th of September I harvested forty hills (which I expected would make the hundredth part of the number of hills contained in an acre, which when measured produced four thousand and eighty hills in different places the first ten hills there was nine quarts, second ten hills twelve quarts, third ten hills ten quarts, fourth ten hills nine quarts, making in the whole forty quarts, which I spread

thin for drying, on the twenty-third of October again measured the same and found only thirty quarts. I then examined the corn in the field and harvested ten hills adjoining the second ten hills, where there was twelve quarts and there obtained nine and a half quarts. On the twenty-seventh of October the whole was harvested and measured one hundred and two bushels and seventeen quarts according to the certificate produced, to which adding twenty-eight pound and three quarters of corn, which was overlooked and found in cutting and carrying off the bottom stalks, would increase it to one hundred and two bushels and thirty quarts. If the whole had been harvested on the twenty-seventh September; at which time forty hills produced forty quarts, there being four thousand and eighty hills to the acre, the ratio must have then exceeded one hundred and twenty-seven bushels with as much certainty as when on the twenty-seventh of October—by reducing that estimation one fifth part (being the quantity shrunk by standing in the field, as appeared in the harvesting the ten hills and obtaining nine and a half quarts adjoining the ten hills which produced twelve quarts) gave one hundred and two bushels, the quantity found in harvesting; the expences of cultivating have not been kept, not contemplating exhibiting it for premium till about harvest time, but was at no additional expence in cultivating from what is usual and generally done except one additional ploughing and harrowing; the value of the whole labor and manure used I could not have obtained here more for it than twenty-five dollars to the acre. The cultivation of the land prior to the ploughing in 1821, was in being sown with herds grass and clover seed in the spring of 1812, and continued mowing without the use of any manure every season afterwards, until ploughed up in 1821, at which time the crop of hay had become very light. The soil a black loam.

FITCH WINCHESTER.

(To be continued.)

From the Connecticut Mirror.

HARTFORD CO. AGRICULTURAL SOCIETY.

The stated meeting, for the choice of officers, and for transacting the annual business of this Society, was held in this city, on Tuesday, the 17th ult. Notwithstanding the bad state of the roads, there was an unusual number of the members from the country present. The increasing interest for the prosperity of the Society, so evidently manifested, by this class of its members, is the best evidence of the utility of the Association; and, viewed in connection with the unanimity which prevailed at this meeting, furnishes a sure pledge of its stability. It is believed, that every citizen, who has had at heart, the wealth, appearance, or respectability of our country, has looked with some interest, upon the transactions of this Society.

It is known and acknowledged, by the friends of this institution that its influence has thus far been limited and that some of its regulations have been defective. Perhaps, too, in some instances, the premiums of the Society have not been awarded in exact proportion to merit. But, from the more recent transactions of the Society, it would seem, that the members are aiding wisdom by their experience; that just

views, in relation to the object of the association, and the manner of affecting it, are becoming more current; and that good ground is afforded for the belief, that its utility will be increased, and its beneficial influence extended.

Without disparagement to his predecessor the almost unanimous election of Mr. Perkins may be considered as an additional pledge of the permanency and usefulness of the Society.

It ought to be well known, that, for some years past, he has devoted his time and attention principally, to Agricultural pursuits; and that he is, in reality, a *practical Farmer*. His associates in office, are *practical men*; and it gratifying to observe, that there appears to be a fixed determination among them, to adhere to their proceedings to the principle which ought ever to be adopted—that of *encouraging, not what will conduce to our individual and national welfare.*

A stated meeting of the members of the H. A. S. was held at the State-House, in pursuance of public notice, on Tuesday, Feb. 17, 1824 and adjourned from that place to Morgan's Hall. The following persons were chosen officers of the Society for the ensuing year:

ENOCH PERKINS, *President*; MARTIN KELLON, *1st Vice President*; LUTHER LOOMIS, *2d Vice President*; JOHN L. COMSTOCK, *Corresponding Secretary*; DANIEL F. HOPKINS, *Recording Secretary*; SOLOMON PORTER, *Treasurer*; CYPRIAN NICHOLS, *Auditor*; SAMUEL S. STEBBINS, *Chairman Farm Com.*; JOSE PRATT, *Chairman Com. on Produce*; HORACE COWLE, *Chairman Com. of Inspection*; BARZILLAI HOBBS, *Chairman Com. on Manufactures*; JOSEPH SPENCE, *Chairman Com. on Ploughing*; HARVEY SEYMOUR, *Seedsman.*

VIEWING COMMITTEE.

Benjamin J. Boardman, Charles Wells, Amos Benson, Martin Ellsworth, Aaron Bissel, Winthrop Bu Joseph Porter, George Cheney.

COMMITTEE ON PRODUCE.

Joseph Morgan, Austin Hall, Linus North, Robert Francis.

COMMITTEE OF INSPECTION.

On *Bulls, Cows, and Hifers*.—Hurlchigh Haskin, Roger Wells, Moses Goodman, jr.
On *Working Oxen and Steers*.—George Wells, Sney Wadsworth, Jeffrey O. Phelps.
On *Horses*.—Roswell Riley, Jonathan Ramses Henry Phelps.

On *Sheep and Swine*.—Philips Gaylord, Asa Bov Samuel Whitman.

COMMITTEE ON MANUFACTURES.

Reuben Langdon, Josephus Granger, Backus Dirge, Jesse Goodrich, Thomas F. Fuller, William M. ther, jr. Timothy Cowles, Dan H. Arnold.

COMMITTEE ON PLOUGHING.

Jedediah W. Mills, Joseph Camp, Gad Lewis, O ver Tudor.

COMMITTEE OF PUBLICATIONS.

John L. Comstock, William H. Morgan.

TOWN COMMITTEES.

Hartford.—Frederick Oaks, Abigene Scarboroug Edward Marsh, Charles Babcock, Roderick Colto Aaron Goodman, E. W. Bull, Russel St. John, Hen W. Terry.

Berlin.—Seth J. North, David Whittlesee, Orr Beckley, Adna Stanley.

Bristol.—Joel Truesdale, George Mitchell, Thom F. Fuller, Joel Root, Philip Gaylord.

East Hartford.—Timothy Hall, Henry Phelps, Sol mon Olmsted, Joseph Goodwin, Joseph S. Spencer.

East Windsor.—Henry Watson, Samuel Tudor Wcott, Jacob Strong, Samuel Bartlett, jr. Henry Elmer Enfield.—Henry Terry, Lorrain T. Pease, Aust Pitkin.

Farmington.—Solomon Cowles, 2d, Samuel Demin John Belden.

Granby.—Erastus Holcomb, Hezekiah Goodrich George C. Owen.

Glensbury.—John Mosely, George Plummer, J. G. Talcott, David Hubbard.
Hartland.—Samuel Benjamin, Eli Wilder, Joel Ennis, Isaac J. Newton.
Suffield.—Martin Sheldon, Asabel Hathaway, Jr.
Simsbury.—John Bester, William Mather, jr. Jeffery Phelps.
Wethersfield.—Barzillai D. Buck, Jesse Goodrich, Roger Wells, Samuel Galpin.
Windsor.—David W. Grant, Roger Phelps, Oliver Hall, Henry Halsey, Horace H. Sill.
Manchester.—Sidney Olcott, Horace Pitkin.

to the Executive Committee of the Hartford County Agricultural Society the Committee of Produce respectfully report:—

That, pursuant to due notice, they met at Morgan's Coffee House, in Hartford, on the 1st inst. and attended to the duties of their appointment: and do award to Henry Ruick, of Windsor, who raised, on half an acre of land, the last season, three hundred and three pounds, and twelve ounces of well dressed flax; and one bushels, three pecks, and seven quarts, of well cleaned seed, from the same, Six dollars. To John Watson, Jr. of East-Windsor, who seeded, the last season, on one hundred and fifty-five rods of land, forty-six bushels of Barley weighing fifty pounds, and twelve ounces per bushel, ten dollars.

Description of the soil, manure, and manner of cultivation will be seen in the statements of the several applicants, accompanying this report.

Signed per order

JOEL FOOTE, *Chairman*
of Committee of Produce.

Hartford, Feb. 17, 1824.

to the Chairman of the Committee of produce, for the Hartford County Agricultural Society:—

Sir—The following is a statement of the treatment of one half of an acre of land, and the quantity of flax and seed produced from it in the season of 1823.

For many years the land had been used for mowing, and was a hard thatch sward. Two years previous, it had been planted to corn, and mowed in the hole. On the first of May last, it was well ploughed for this crop once only, and harrowed. On the fourth, it was sowed with twenty four quarts of seed, and that seed covered with a bush. The flax was pulled about the 20th of July, and dew rotted in October.

The produce of good, clean, and well dressed flax, was Three hundred and three pounds, twelve ounces, and nine bushels, three pecks, and seven quarts, of excellent, well cleaned seed, all of which has been weighed and measured previous to the 26th day of January, 1824, the above was raised in Windsor.

HENRY RUICK.

Dated at Windsor, January 26, 1824.

Joel Foote, Esq. *Chairman of Committee of Produce, of the Hartford County Agricultural Society:*—

Sir—The one acre of Connecticut River meadow land, on which I raised forty-eight bushels, and thirteen quarts of Barley, the season past, weighing 503 lbs. to the bushel was to over in 1821. In 1822 it was manured with thirty cart loads barn yard manure—ploughed, and planted to corn, and produced eighty-two bushels. First April, 1823, it was ploughed—

and the 12th sowed three bushels Barley, and harrowed it in. The Barley was soaked in water, and rolled in plaster.—Harvested the 14th July—the land ploughed the next day, sowed with Buckwheat, and produced (twenty-two) bushels. The Surveyors's certificate, (with others) of the measure of the land, and quantity and weight of the Barley, are inclosed.

I am, Sir, yours most respectfully.

JOHN WATSON, Jr.

East-Windsor, Feb. 16th, 1824.

ADVANTAGES OF SILK WAISTCOATS.

The power of electricity over the body, is well known in fact, we can never enjoy health nor comfort without a proper portion of it in the system. When this portion is deficient, we feel languid and heavy, and very foolishly pronounce a libel on the blood which is quite innocent while we never suspect the damp atmosphere of robbing us of our electricity.—Yet so it is.—In dry weather, whether it be warm, cold, or frosty, we feel light and spirited, because dry air, is a slow conductor of electricity, and leaves us to enjoy its luxuries. In moist or rainy weather we feel oppressed and drowsy, because all moisture greedily absorbs our electricity, which is the buoyant cordial of the body. To remedy this inconvenience, we have only to discover a good non-conductor of electricity to prevent its escape from the body; and this we have in silk, which is so excellent a non-conductor that the thunderbolt or the forked lightning itself, could not pass through the thinnest silk handkerchief provided always, that it be quite dry. Those therefore who are apt to become lowspirited and listless in damp weather, will find silk waistcoats, drawers, and stocking, the most powerful of all cordials. Flannel is also good, but nothing so powerful as silk. Wash leather is likewise a non-conductor of electricity, and may be used by those who prefer it. But silk is by far the best; and those who dislike to wear flannel next to the skin, will find equal benefit by substituting cotton shirts, drawers, and stockings, with silk ones over them; or where more heat is required, flannel ones between the cotton and the silk, for the silk should be always outermost. We like to give reasons for our advice and our readers may depend on the philosophy of these recommendations; we can answer for their being practically correct. Silk, indeed should be used in every possible way by the weak—in the linings of sleeves, in the stiffeners of neckcloths, and even in the entire backs of surtouts, cloaks, mantles, and in the coverlets of beds, &c. and where health is in question, it will in the end be found to be the most economical stuff that can be used, as it will save many an apothecary's bill. When it can be a principal means of preventing consumption, rheumatism, gout, inflammations, melancholy, madness, and even suicide itself, no expense ought to be spared.—*Freeman's Journal.*

LAMBS.

The first care of them is to see whether they can come at the teat; and if not, to clip away the wool of the ewes which hinders them, as also all tags of wool on the udders of the ewes, which the lambs are liable to take hold of instead of the teats.

If a ewe refuse to let her lamb suck, she and her lamb should be shut up together in a close

place, till she grow fond of him. For this purpose, some say that surprising a sheep with a dog will be effectual.

Care should be taken to feed the ewes plentifully after yeaning, and with some juicy kind of food, so that the lambs may not fail of having plenty of milk. The rams may be gelded at any time from one to three weeks old, if they appear to be well and strong.

They should not be weaned till they are six weeks, or two months old. At this age they should be taken from the ewes, and have the best of pasture during the first fortnight; by the end of which time they will be so naturalized to living wholly upon grass, that they may be turned into a poorer pasture.

The worst woolled lambs, and coloured ones, and those that are very small, should be destined to the knife, and not weaned. So great is the need of increasing the manufacture of woollen in this country, that I must earnestly recommend it to the farmers, not to kill, or sell for killing, any lamb, till it is near half a year old, or till the wool become to such fulness of growth, as to be valuable for spinning. To kill them earlier is so wasteful a practice as to be inexcusable.

Those ewe lambs which are kept for stock, should not come at the rams; For if they have lambs at a year old, it stints them in their growth; and they have so little milk, that their lambs commonly die for want of nourishment. Or if they chance to live, they will be apt to be always small. This practice is one reason why our breed of sheep in this country is so poor.

The largest lambs should be sheared at the time of the new moon in July. Their fleeces will yield as much the next year, and the wool will be better, and as cold storms rarely happen at that time of the year, the lambs will do better without their fleeces than with them.

Deane's N. E. Farmer.

IRON CARRIAGE WHEELS.

C. Hoxie, of the city of Hudson, has been engaged a number of years in making an improvement in carriage wheels; which consists in the rims and spokes being made of wrought iron. These wheels are so put together, that it is impossible for a spoke to get loose; of course they are strong and very durable, the weight about the same as those made of wood, and the centre part of 50 of those wheels may be completed in 15 minutes.

The inventor being desirous of having them generally introduced, invites the attention of furnace companies, manufacturers of iron, and such as may feel disposed to purchase a privilege for making those wheels. There can be no doubt but such an establishment would be lucrative to the owners, and beneficial to the public, as also an article of extensive exportation. It is believed that but a few years will roll away, before wooden wheels, for carriages of every description, will be rolled out of existence. All stages ought to be furnished with iron wheels, having the rims plated with steel, especially in the winter, on account of the safety of passengers.—*Northern Whig.*

Oil Gas.—At a meeting of the new Gas Company at Edinburgh, on Thursday se'night, Sir Walter Scott said, that he had now had three months' experience of oil-gas light in his

house at Abbotsford, and he could assure the meeting that nothing could be more useful, safe, and economical. He was sure the expense was not the twentieth part of what it had formerly cost him for oil and candles. The light itself was greatly superior, was extremely cleanly, saved much trouble to servants, and did not produce the least smell, or the least injury. Not only could it be used in kitchens and dining-rooms, but it was extremely useful in bedrooms, where a flame could be kept up during the whole night so minute as to be scarcely perceptible, which could be enlarged to a powerful light in an instant at any hour when wanted. It was also very safe, at least was much safer than common lights, for it was not carried from place to place as common lights were; and unless combustibles were brought to it, no danger could arise. The light was, indeed, so convenient, cheap, and delightful, that were it once introduced, he was convinced it would be used within two years in every private house in Edinburgh.—*Lon. Far. Jour.*

A CHEAP MODE OF MANUFACTURING BAROMETERS.

Take a common phial bottle, and cut off the rim and part of the neck. This may be done by a piece of string, or rather whip-cord twisted round it, and pulled strongly by two persons, in a sawing position, one of whom holds the bottle firmly in his left hand. Heated in a few minutes by the friction of the string, and then dipped suddenly in the cold water, the bottle will be de-capitated more easily than by any other means.

Let the phial be now nearly filled with pump-water, and, applying the finger to its mouth, turn it quickly upside down: on removing the finger, it will be found that only a few drops escape. Without cork or stopper of any kind, the water will be retained within the bottle by the pressure of the external air, the weight of air without the phial being so much greater than the small quantity within it.

Now let a bit of tape be tied round the middle of the bottle, to which the two ends of the string may be attached so as to form a loop to hang on a nail; let it be thus suspended in a perpendicular manner, with the mouth open, downwards, and this is the barometer.

When the weather is fair and inclined to be so, the water will be level with the section of the neck, or rather elevated above it, and forming a concave surface. When disposed to be wet, a drop will appear at the mouth, which will enlarge till it falls, and then another drop, while the humidity of the atmosphere continues.

To the truth of this experiment I can give my *probatum est*: but shall be glad if any of your scientific correspondents will explain more particularly the ratio of it.

Why will not the water remain in the bottle, unless the rim be cut off? which is the fact. Why should the water drop in moist weather, when (as I have tried) holding the bottle before the fire will not produce the same effect?

Calcutta Gazette.

(Translated for the Charleston Courier.)
FROM "L'HISTOIRE DES CHILINS CELLERES."

THE SPANIEL AND THE SCHOOLBOY.

We might fill a series of volumes if we were to relate the accounts of those valuable Dogs

that have saved their master's lives but to give authenticity to our collection, we insert only attested facts, from works of reputation.

In a Paris Journal, and other periodical publications of September 1778, we found the following story:—

A schoolboy, instead of going to join his class at the Mavarin College, played truant, and went to bathe in the Seine, with several of his school-fellows, and a Spaniel Dog. While the boy was swimming and crossing the river, he was seized with a violent cramp, so that he could no longer sustain himself, and sunk senseless to the bottom. His companions unable to swim, could afford him no assistance, and he was in imminent danger of perishing, when, happily his dog ran to his relief; he plunged eleven times successively to the bottom of the river, and seizing his young master, now by his clothes and then by his hair, he drew him by degrees near the shore, where his associates received and succoured him. Exhausted by this great fatigue, the poor Spaniel had not strength enough to escape from the abyss from which he had rescued his master—he was carried away by the current, and died for fidelity.

German Cement for mending Glass and China.

—Reduce, separately, to the finest powder, equal quantities of unslaked lime and flint glass, and as much litharge as both of them together; the proportions to be adjusted by measure, when reduced to powder. Mix them well together, and work them up into a thin paste with old drying oil. This cement, or paste, which is very durable, will even acquire a greater degree of hardness when immersed in water.—*Eng. publication.*

NEW ENGLAND FARMER.

SATURDAY, MARCH 13, 1834.

HORTICULTURE. A gentleman in Dorsetshire, having imagined that lime, from its causticity, would be deleterious to insects, and that the crevices in walls afforded a nidus for the eggs of that wonderful species of them which so much injure our fruit trees, determined on making an experiment on a peach tree, which was nearly destroyed by them, having had its young shoots, for several years, regularly curled by the aphid in the month of May; he therefore began by unnauling and matting the tree, and then had the wall white washed with a very thick solution of lime, and after it was quite dry the tree was again nailed: the result was, that every tree in the garden, except the one on the white washed wall was covered with the apides, that not having any aphid (or blight of any kind on it), except on the extremity of a branch that extended beyond the white washed wall, and the tree is in a most vigorous and healthy state. If a darker color is preferred, on account of its greater absorption of heat, soot may be added to the lime, and perhaps may contribute to the destruction of the insect. Care must be taken to fill up all crevices in the wall, and not to let the tree be touched by the white wash. Whether the lime destroys the eggs of the aphid, or is so destructive or disagreeable to the insect itself as to cause it to avoid the white washed wall is a question to be solved by naturalists.—*Bell's Weekly Messenger.*

REMARKS.—The insects above mentioned are sometimes, we believe, called *Puccions*, or *Vine Fretters*.—They are, likewise, known by the name of *Plant Lice*. Linnaus and Gmelin enumerate about seventy species of these tiny depredators. Rees' Cyclopaedia gives a long account of them, and says "they abound with a sweet and graceful moisture, and are therefore eagerly devoured by ants, the larva of coccinellæ, and many other creatures, or they would become, very probably,

more destructive to the whole vegetable creation than any other race of insects known." Mr. Curtis says "they are the principal cause of blights in plants, and the sole cause of the honey dew. Though no mode of destroying aphides will, perhaps, ever be devised on a large scale, in the open air by artificial means, it can be accomplished most effectually when they infest plants in stoves, green houses, and frames, or any situation in which they can be enveloped for a certain time in clouds of smoke. Powders or liquids, however fatal to apides, must ever be ineffectual, from the trouble and difficulty of applying them so that they may come in contact with the insects." Tobacco smoke is however adequate to their destruction in green houses, or confined situations. Deane's New England Farmer asserts that "the best remedy is the simplest. Soap suds, forcibly applied, will, after one or two applications effectually destroy them, without apparent injury to the plant."

FRUIT TREES. The following experiment will effectually protect fruit trees from the ravages of the Caterpillar:—A clod of earth moulded round the top of the trunk of the tree is the whole of the process.—From the hour that this operation is performed, the insects, even in the most remote branches, will begin to fall, and the tree will in a short time be wholly freed from this destructive incumbrance. It is true that the animal will attempt to renew his depredations, but as soon as he arrives at the ring of earth, which should be permitted to remain, he will hasten down the trunk, with morerapidity than he attempted the ascent.

London paper.

It would be well to ascertain by experiment whether the above mentioned mode of annoying Caterpillars would produce the result specified. We doubt its efficacy, but hope it will be tried.—*Editor.*

GROSEILLE RED WINE. A sample of wine, manufactured at Providence, by Dyer & Co. from currants of American growth has been presented to us by Mr. E. Copeland, Jr. of No. 65, Broad-Street, Boston. The wine is rightly denominated "SUPERIOR Groseille Red Wine," and we doubt whether the Falernian of Horace, or even the Nectar of Jupiter could hold a candle to it. To our homespun palate it is preferable to most imported wine; and surely every true patriot should drink such wine (if he drinks any wine) because it is a real, wholesome, genuine Columbian beverage.

COMMUNICATION.

REMARKABLE GAIN IN A Yoke OF OXEN.—Mr. Asa Rice, of Shrewsbury, owned and fattened a yoke of oxen, which were lately slaughtered by Messrs. Winchester. These cattle performed, unaided, all the work on the farm of Mr. Rice, consisting of one hundred acres, for the two last years. They hauled all his wood, on a hard road a mile and a half the last season. They ploughed ten acres of ground twice, and harrowed the same, moved about one hundred loads of manure, and in the time worked seven and an half days on other people's land. They were kept constantly at hard labor of one kind and another till the first of August last. In this month they were kept in good feed only. The months of September and October they were fed with stalks and small ears of corn.—The months of November and December they eat 35 bushels of potatoes, and ten bushels of cobish meal,* so called, together with good hay. They were sold at Brighton the last Monday in December. It was said for half a dollar per hundred more than had been given for any other cattle, for a number of months. Their weight was 2763 lbs. tallow 302.

* By "cobish meal," we believe our correspondent means the produce of Indian corn ground or broken with the cob, without shelling it before it was submitted to the operation of the mill.

FOREIGN.

London papers have been received in this place by the arrival of the packet ship Emerald, from Liverpool, the very short passage of fifteen days and fourteen hours, to the date of the 18th February.

On the 3d of February the British Parliament assembled and the King's Speech was read by the Lord Chancellor, in consequence of his Majesty's indisposition.—His speech is pacific, and congratulates Parliament on the prosperous condition of the country. In the course some debates relative to an Address in answer to the King's Speech, Mr. Canning adverted to "the intention of England to maintain itself in peace; to move fully like one of the heavenly bodies, within its own orbit, tracing its path not of obedience, but of independence; not to look too nicely at the courses of other bodies, which moved in the same system, only that it did not strike against us or break into our path." Mr. Canning likewise expressed the determination of Great Britain to remain neutral in the contest between the Greeks and Turks.

A London article dated Feb. 18, states that Parisiers of the 17th inform that a consultation of Physicians had declared the state of the health of the King of France to be dangerous, and that it was impossible should outlive the month of March.

A London article dated Feb. 15th states that "the Minister of yesterday officially announces that the King of Spain has signed a decree granting liberty of the trade with South America to all nations, on the footing of an equality of duties. The decree was obtained by the solicitation of France and announced by telegraph."

ORIENT, JAN. 6. The Greeks have made a successful descent on the Island of Mytilene, where 7500 of the Turks had hoisted the Cross; and it was expected the Turks would be compelled to abandon this extensive Island. The Turkish garrison of Patras have evacuated the place and retired to Lepanto.

ALGERIE, DEC. 2. The Algerian squadron cruising off Algiers has just been destroyed by a naval division of the Hydra.

Intelligence has been received at Valparaiso, on the 12th of October, that the Patriot army under Gen. Santa Cruz, 7000 strong, had been defeated and dispersed, and the loss of 4000 men, arms, baggage and stores of every kind, at the Disagadero, by the Vice Roy and General Valdez. The above intelligence, which we hope will prove unfounded, was brought by the whaling ship Frederick Augustus arrived at Newport.

DOMESTIC.

An attempt to rob the U. S. Mail was made on the morning of the 17th ult. between Augusta and Milwaukie. Three persons fired on the driver but without effect, and made their escape.

Mass.—On the 2d inst. the principal work shop of the United States' Arsenal, in Springfield, Mass. was completely destroyed by fire, together with a considerable number of tools, muskets, &c. Most of the property within the work shop was saved from the flames.

The house of a Mr. Allen, in Exeter, N. Y. was consumed by fire on the 12th ult. Two children who were on the second floor escaped by leaping from the window. They immediately opened the door, and gave the alarm to their parents. Mr. Allen escaped, but Mrs. Allen and her child were burnt to death.

Professor Griscom, of New York, has issued a proposal for a new periodical publication, to be entitled "The Mechanic's and Manufacturer's Magazine," to be published monthly, and to be devoted to the Arts and Trades of the United States.

Steam Boat Cause.—The Supreme Court of the U. S. has decided the important cause of Gibbons vs. Ogden, commonly called the Steam Boat Cause. By a decision it was determined that the Legislature of New York, cannot, according to the constitution, grant any exclusive right to navigate the waters of that State by vessels propelled by steam.

On Thursday night last, a barn belonging to Williams, of Dalton, was destroyed by

fire, together with 600 bushels of grain, 3 horses and 1 cow. It is supposed the barn was set on fire, by a boy belonging to the family.—*Greenfield Gazette.*

CONGRESSIONAL.

In SENATE.—Friday, Feb. 27. The Committee of Finance reported the Militia Appropriation bill from the House, without amendment, and the Senate proceeded to the consideration of it in Committee. Mr. Macon moved to strike out the appropriation of \$10,000 for the purpose of purchasing a farm in the vicinity of West Point Military Academy, upon which there is a tavern, and after some debate the further consideration of the bill was postponed till Monday.

Monday, March 1. This day was mostly spent in attending to private and local business. The death of the Hon. William Lee Ball, a Member of the House, having been announced, a resolve passed that the Senate would attend his funeral the next day, and wear crepe for 30 days. The Senate adjourned.

Wednesday, March 3. The Senate, in Committee, resumed the consideration of the bill relative to Military Appropriations. The motion of Mr. Macon to strike out the clause providing for the purchase of a farm, upon which is a tavern, in the vicinity of the Academy at West Point was again debated, and negatively. Yeas 16, Nays 20.

House.—Friday, Feb. 27. Mr. Webster, from the Committee on the Judiciary, made a report recommending the concurrence of the House with amendments of the Senate to the bill for repealing the act to lessen the compensation to Marshalls, Clerks and Attorneys, which report was agreed to.

The House, in Committee, resumed the consideration of the new Tariff. Mr. Barbour's motion to strike out the duty of 25 cents on wheat was supported by Messrs. Garnet, P. P. Barbour, and Webster; and opposed by Messrs. Taylor, Clay, Baylies, Todd, Wright, Tracy, Mallory, Marvin, Ross, Ingraham, Vance, Buchanan, and McLane; when the question was taken, and decided in the negative 113 to 71.

Saturday, Feb. 28. Mr. Webster, from the Judicial Committee, reported a bill "further to amend the Judicial system."

Mr. Fuller, of Mass. moved to strike out the duty of one dollar and twelve cts. per cwt. on imported iron, &c. and supported his motion by a speech of considerable length. He was followed by Mr. Buchanan, of Penn. who opposed the motion at some length. Mr. Mallory, of Vermont, opposed the motion in a speech of nearly three hours duration.

Monday, March 1. As soon as the House was in order, Mr. A. Stevenson, of Virginia, announced the death of his friend and colleague, William Lee Ball, and pronounced a short eulogy on his merits and virtues.

Resolutions then passed to attend the funeral, wear crepe, &c.

Neither House held a session on Tuesday, but attended to the funeral of the Hon. Mr. Ball.

Wednesday, March 3. The House, in Committee, resumed the consideration of the Tariff. The question on Mr. Fuller's motion to strike out the duty of \$1,12 per cwt. was negatively. Yeas 54, Nays 85.

BRISTOL CROWN GLASS.

150 BOXES Bristol Crown Window Glass, of superior quality, just received and for sale, wholesale and retail, at the very lowest prices, by ERIGHAM & DELANO, No. 30, Union-street, Boston, March 13, 1824.

NEW TOWN OFFICER.

JUST published by DORR & HOWLAND, A new Town Officer, Containing the General Laws of Massachusetts relating to the Choice, Powers, and Duties of Town Officers arranged under their respective titles.—For sale at their Bookstore in Worcester, and by RICHARDSON & LORD, Boston. Worcester, March 1, 1824.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of Mangel Wurtzel Seed, raised by John Prince, Esq., Roxbury. Feb. 21.

TO PRINTERS.

FOR sale at this Office BALL SKINS, at the usual prices.

VALUABLE STOCK FOR SALE BY THE SUBSCRIBER.

A VERY superior MALTESE JACK ASS, 7 years old, 14 hands high, remarkably well made, and so quiet in his temper, that a child can manage him, he was obtained of the Governor of Malta and imported by Capt. Robert B. Edes.

Also two BULLS 22 months old out of good native cows, they are well formed and give six feet each. Price \$100 each.

Also one BULL 23 months old, out of the famous, *Plenderney* cow, imported by John Hubbard, Esq. Price \$125.

Also the Bull VANKEY, 34 months old out of a very fine native cow owned by Mr. Francis Amory. *Vankey* received a premium at Brighton Show in October last. Price \$125.

The above Bulls are in fine condition and were all four sired by the noted improved Durham Short Horn Bull *Clebs*.

If the Bulls are not sold by the 20th of April next, they will be let on shares.

SAMUEL JAKUES, Jr.

Charlestown, Mass. March 13, 1824.

BY T. G. FESSENDEN.

"A soft answer turneth away wrath."

A gentle answer will assuage
The ruthless vehemence of ire,
But petulance opposed to rage
Is adding fuel to the fire.

He who is cautious, calm and cool,
When made the subject of attack,
May smile defiance on the fool,
Whose anger puts him on the rack.

If injury you must repel,
Hard words are not of any use,
The greatest energy as well
Is shown without, as with abuse.

If one should offer you offence,
By being angry with the elf,
Instead of gaining recompense
You are but punishing yourself.

But gentle answers will assuage
The headlong vehemence of ire,
While petulance opposed to rage,
Adds tenfold fuel to the fire.

MISCELLANY.

FOR THE NEW ENGLAND FARMER.

Capricious and affected nicety shows the want of good breeding as well as good sense; and those are generally most pleasing, who are most easily pleased.

Importance of Health.—No pains, expense, self-denial or restraint to which we subject ourselves for the sake of health is too much.—Whether it requires us to relinquish lucrative situations, to abstain from favorite indulgences, to control intemperate passions, or undergo tedious regimens; whatever difficulties it lays us under, a man who pursues his happiness rationally and resolutely will be content to submit to.

Indolence.—To act is far easier than to suffer; yet we every day see the progress of life retarded by mere repugnance to motion; and find multitudes repining at the want of those conveniences, or necessities, which nothing but mere indolence prevents their enjoying. The rewards of industry are within their reach, but the demon of idleness paralyzes their arm, and prevents their reaching those comforts and enjoyments which are the prize of exertion.

Gaming.—In gaming, Judge Blackstone says, the several parties engaged cast lots to determine upon whom the ruin shall at present fall, that the rest may be saved a little longer. Taken in any light, this is an offence of the most alarming nature, tending, by necessary consequence, to promote public idleness, theft, and debauchery, among those of a lower class; and, among persons of a superior rank, it hath frequently been attended with the sudden ruin and desolation of ancient and opulent families, and abandoned prostitution of every principle of honor and virtue, and too often hath ended in self-murder. To this passion every valuable consideration has been made a sacrifice; and it is a passion which has lamentably prevailed in our own country, and which we seem to have

derived from our ancestors the ancient Germans; who, according to the account given of them by Tacitus, were bewitched with the spirit of play to a most exorbitant degree. "They addict themselves," says he, "to dice (which is wonderful) when sober, and as a serious employment, with such a mad desire of winning or losing, that, when stripped of every thing else, they will stake at last their liberty, and their very selves. The loser goes into a voluntary slavery, and though, younger and stronger than his antagonist, suffers himself to be bound and sold. And this perseverance in so bad a cause they call the point of honor." "One would think (says Blackstone) that Tacitus was describing a modern Englishman. Against a spirit so frantic, laws can be of little avail, because the same false sense of honor that prompts a man to sacrifice himself, will deter him from appealing to a Magistrate. Yet it is proper that restricting and protecting laws should be enacted, and that they should be publicly announced and repeatedly inculcated, if possible to preserve the unwary, if not to reclaim those who are on the brink of ruin."

Father le Compte, in his travels in China, says, "Gaming is equally prohibited among the common people and the Mandarins; and yet this does not hinder their playing, and frequently losing all they have—their lands, houses, children and even their wives, which are all sometimes laid on a single card." Shakspeare says, "keep a gamester from his dice, and a good student from his book, and it is wonderful."—Lord Bacon says, "a gamester, the greater master he is in his art, the worse man he is."—And Addison says, "could we look into the mind of a common gamester, we should see it full of nothing but trumps and mathadores; his slumbers are haunted with Kings, Queens, and Knaves."—*London Farmers' Journal.*

Gallant Escape of twenty-two Greeks.—The *Oriental Spectator* of Smyrna, received last week contains the following highly interesting account of the escape of twenty-two Greeks from the Turks, who had taken them prisoners: SMYRNA, Oct. 17.—We spoke lately of 22 Greeks who were taken at sea, brought to Smyrna, and then sent in chains to Constantinople. When they arrived at Mualich, they were put on board a vessel with a crew of 17 Turks.—This vessel arrived at Constantinople during the night, and anchored under the walls of the Seraglio. Only three Turks remained on deck, and the others, who had left their arms there, had gone below to amuse themselves in the cabin. The Greeks were in the hold; their chains were taken off, and they were only bound with cords, that they might more easily be landed the following day. The principal of the Greeks immediately saw the advantage he might derive from the happy moment offered by fortune, in a situation which seemed desperate. He approached one of his countrymen, who succeeded in loosing the cords that bound him, with his teeth. As soon as his hands were free, he successively, and without noise, released all his companions.

The twenty-two Greeks having, by a bold and successful effort, made themselves masters of the vessel assumed the Turkish costume, in which they were aided by the length of their beards, which had been suffered to grow, set

sail and disappeared;—but a new danger threatened them at the Dardanelles—they are ordered to stop; they reply in Turkish, that the curra has taken them away—that they are going the fleet with orders from the Sultan; they suffered to pass, and soon reach the sea Castle, where they succeeded in the same manner. A much greater danger awaited them at Tenedos: it was broad day-light—a Turkish frigate sailed towards them—they had the presence of mind to show themselves on deck, and to retire under the very guns of the fort at Tenedos. This bold and ingenious manoeuvre succeeded: the frigate convinced that they were Turks, tacked about just as they were at the point of reaching them; they took the moment to sail again, the wind being favorable. But soon the nature of their dangers changed, they met a Spezziot vessel, which, taking them for Turks, fired at them. They succeeded in making themselves known, and all of them reached Ipsara in safety, after a voyage of three days.—We warrant the correctness of all these details, which are known even to the Turks who have taken the matter very coolly.—*Illustrations.*

Language of the Brute Creation.—The following singular fact is related by Father Bouge: "A sparrow finding a nest that a martin just built, standing very convenient for himself, possessed himself of it. The martin seeing usurper in her house, called for help to exterminate him. A thousand martins came full speed attacked the sparrow; but the latter being armed on every side, and presenting only a large beak at the entrance of the nest, was invulnerable, and made the boldest of them durst approach him repent their temerity. After a quarter of an hour's combat, all the martins disappeared. The sparrow seemed to think he had got the better, and the spectators judged that the martins had abandoned the undertaking. Not in the least. In a few seconds they returned to the charge, and each of them having procured a little of that tempered with which they make their nests, they all once fell upon the sparrow, and enclosed in the nest to perish there, since they could not drive him thence."

Can it be imagined that the martins could have been able to hatch and concert this design of them together, without some medium of communication equivalent to language?

Sagacity of the Fox.—A few years ago, a Barker, of Plymouth County, Mass. with three or four others and a fox-hound, went in pursuit of foxes. In proceeding to the Fox Cliff, so called, on the Scituate side of the Cape, they had not gone far when the dog detected a fox. The fox ran directly for the cliff, which at that place was between sixty and eighty feet high. Being stopped there by the men and closely pursued by the dog, he swung himself off the bank, and hung by his paws. The dog following ran off the cliff was dashed to pieces. As soon as Reynard perceived the fate of his pursuer, he passed down the cliff, took a new start, and made his escape.

No. 34.

REMARKS ON VEGETATION, &c.

[Continued from page 256.]

TO DETERMINE THE GOODNESS OF SEEDS. The weighing of a given measure of seeds may generally be esteemed a criterion; as it is known that when seeds are put into cold water those which are less perfect are liable to swim and the sound ones to sink.* It is a proper criterion of good seed wheate to cast it into salt water, just strong enough to float an egg; as the more salt there is dissolved in water the heavier it becomes; and thence none but quite pure grains of wheat will sink in this brine, and that which swims is properly rejected.

The weight of a given measure of grain will also, with considerable certainty discover the quantity of husk or bran contained in it, compared to the quantity of flour; as that grain which is cut too early or is not quite ripe, or opens in wet seasons, shrinks in the barn or barnyard, and becomes wrinkled, and has thus a larger proportion of skin or bran than that which has been perfectly ripened, and will therefore weigh lighter in proportion.

There is reason to believe that a progressive improvement of many seeds exists during the warmer days of winter in our granaries, which probably consists in the process of the conversion of mucilage into starch; in the same manner as the harsh juices of crab-apples and of green pears, are continually changing into sugar during the winter; both which processes are probably in part chemical like the slow, perpetual change of sugar into vinous spirit. This improvement of wheat, and of barley, and of oats is well known to the baker and the brewer, and the horse dealer; as bitter bread made from old wheat, and barley is better converted into malt in the vernal months; and these are believed to thrive better, and to possess more vigor, when they are fed with old than with new oats.

Mrs. B. G. Sage gives the following process to discover whether wheat has been injured by frost or the nutritive matter otherwise spoiled. Make a paste with flour and water, wash it with your hands under water, which will be frequently changed, till it no longer comes discolored. The substance remaining is the gluten; if the corn be good this is elastic, and will contract when drawn out; if the corn has begun to heat it will be brittle; if the corn has fermented, none of the gluten can be obtained.

These seeds of a perishable nature are to be sent to or brought from distant countries, and among them with sugar is the most certain salutary method of preserving them.---Dr. Heyd, of Belmont, in Staffordshire, England, having observed some seeds, which came originally among raisins, to grow readily, directed many seeds to be sent from the West Indies covered with raisins, and others in sugar, and that those immersed in sugar or cov-

ered with raisins, both looked well and grew readily, whereas many others would not vegetate.

Since the powder of fresh burnt charcoal is known powerfully to absorb all putrid vapors; it is probable that seeds mixed and covered with charcoal dust, which has recently been burnt, or not long exposed to the air, might be successfully employed for the preservation of seeds either in long voyages, or in domestic granaries.

When seeds brought originally from other climates are to be sown, attention is required to the circumstance of season and of soil.---Those which will ripen their seeds the same year are to be sowed early in the spring, and covered lightly with earth, and should be buried beneath the soil, soon after it has been ploughed or dug, as its interstices are then replete with atmospheric air; which may be necessary to stimulate the root. Those seeds, however, which will not perfect their vegetation in the same year must be sown in early autumn; and though all seeds vegetate better, when placed but a little beneath the surface of the soil, as one inch, because they then have a better supply of atmospheric air which may be necessary for their first growth, before they have acquired leaves above ground; yet as many foreign seeds may not be sufficiently hardy to bear our inclement winters, it may be necessary, as some believe, to bury them an inch and a half or two inches deep in the soil, to prevent the frosts from doing them injury. And the drill method, or sowing seeds in rows is the most convenient mode of sowing them at a determined depth, and also for the purpose of keeping the young plants clear from weeds by the more easy application of the hoe.

In gardens near large towns where the land is valuable and highly manured, gardeners sometimes sow two or three kinds of seeds on the same ground, for the purpose of economy.---Thus, Mr. Marshall observes that, on the same ground they sow radishes, lettuces and carrots; the radishes are drawn young for the table, the lettuces to plant out, and a sufficient crop of carrots is left; for carrots, if you wish them to be large should not grow very near to each other.

In defence of this mode of culture, it is said, if one crop fails, the others may do well, and there is no loss of ground or time; and if all succeed they do very well. Radishes and spinach are commonly sown together by the common gardeners, and many manœuvres of intercropping are made by them, in the sowing and planting between rows of vegetables that are wide asunder, or presently to come off, or in the alleys of things cultivated on beds.

Thus if a piece of horse radish be newly planted it may be top cropped with radishes or spinach, &c. or if a piece of potatoes be planted wide, a bean may be put between each set, in every or every other row; a thin crop of onions upon new asparagus beds is a common practice, drawing them young from about the plants.---*Introduction to Gardening*---*Rivington*. See likewise *New England Farmer*, vol. i. p. 351, and vol. ii. p. 135.

There are some seeds, as those of carrots, that are so difficult to be sown in uniform qualities, that it has been customary to mix them previously with sand or garden mould, for the purpose of giving them weight, or bulk, or to detach them from each other. And some even suffer them to begin to put forth their roots in such a mixture of moist sand or garden mould for the purpose of more regularly dispersing them.

In dry seasons, the soaking of seeds in water a day or two before committing them to the ground, will forward their growth, as well as by artificially watering the ground before or after sowing them; and the soaking of them in salt and water may have another advantage of giving an opportunity of rejecting the light seeds, which float, and perhaps of destroying some insects which may adhere to them; the sprinkling some kinds of seed with lime may also be of advantage for the purpose of destroying insects.

Mr. Chapel, according to the papers of the Bath Agricultural Society found great benefit in steeping barley in the black liquor which oozes from manure heaps for twenty four hours, and skimming off the light grains. On taking it out of the water he mixed wood ashes sifted with the grain to make it spread regularly. But the best agriculturists are of opinion that if ground is well prepared to receive the seed, is well manured and tolerably moist, steeps of any kind will generally prove injurious, by weakening the vegetative principle. The quantity of manure, or food for plants which is added to the seeds by steeping them in fertilizing mixtures must be trifling. But when seed is sown late, the soil dry, and injury is apprehended from insects' preying on the germ before or soon after it sprouts, steeping in some bitter or saline mixtures may be of service.

N. B. The foregoing observations are mostly extracted and abridged from the works of Dr. Darwin and other authors, whose authority is generally considered as paramount in relation to the subjects of which they treat.

ON GRAFTING FRUIT TREES, &c.

[Concluded from page 258.]

"Mr. William Fairman, of Kent County, England, has inserted in the 20th vol. of the *Trans. Soc. Arts*, London, an account of his mode of "extreme branch grafting," upon old decaying trees, which promises to be a very great acquisition to those who take pleasure in cultivating fruit. The process is as follows:

"Cut away all spray wood, and make the tree a perfect skeleton, leaving all the healthy limbs; then clean the branches, and cut the top of each off, where it would measure in circumference from the size of a shilling to about that of a crown piece. Some of the branches must of course be taken off where they are little larger, and some smaller, to preserve the canopy or head of the tree; and it will be necessary to take out the branches which cross others, and observe the arms are left to fork off, so that no considerable opening is to be per-

For more particular directions relative to trying the method of seed by this method see N. E. Farmer, page 293.

ceived when you stand under the tree, but that they may represent a uniform head. When preparing the tree, leave the branches sufficiently long to allow of two or three inches to be taken off by the saw, that all the splintered parts may be removed. The tree being thus prepared, put in one or two grafts at the extremity of each branch, and put on the cement or composition, and tie with bass or soft strings. Sever the shoots or suckers from the tree until the succeeding spring. To make good the deficiency in case some grafts do not succeed, additional grafts may be inserted in the sides of the branches, or where they are wanted to form the tree into a handsome shape."

Mr. Fairman objects to the mode of grafting at a short distance from the trunk or body of the tree, as the wounds are so large as to require several grafts which cannot firmly unite and clasp over the stumps, and consequently these wounds lay a foundation for after decay; or else they diminish the growth of the tree; whereas on his plan they will be larger in three or four years than before the operation.

BUDGING OR INOCULATING. This process answers the same end as grafting excepting that grafted trees commonly bear fruit sooner than budded trees. Mr. Miller says, "this is commonly practised upon all sorts of stone fruit in particular, such as peaches, nectarines, cherries, plums, &c. as also upon oranges and jasmynes, and is preferable to any sort of grafting. The method of performing it is as follows: You must be provided with a sharp penknife, having a flat half the use of which is to raise the bark of the stalk to admit the bud) and some sound bass mat, which should be soaked in water, to increase its strength, and make it more pliable; then having taken off the cuttings of the trees you are to propagate, you should choose a smooth part of the stock about five or six inches above the surface of the ground, if designed for dwarfs; but if for standards, they should be budded six feet above ground; then with your knife make a horizontal cut across the rind of the stock, and from the middle of that cut make a slit downwards about two inches in length, so that it may be in the form of T; but you must be careful not to cut too deep, lest you wound the stock. Then having cut off the leaf from the bud, leaving the foot stock remaining, you should make a cross cut about half an inch below the eye, and with your knife slit off the bud, with part of the wood to it. This done, you must with your knife pull off that part of the wood which was taken with the bud, observing whether the eye of the bud be left to it or not (for all those buds which lose their eyes in stripping should be thrown away, being good for nothing.) Then having gently raised the bark of the stock where the incision was made, with the flat half of your penknife, cleave the bark from the wood, and thrust the bud therein, observing to place it smooth between the rind and the wood of the stock, cutting off any part of the rind belonging to the bud, which may be too long for the slit made in the stock: And so having exactly fitted the bud to the stock, you must tie them closely round with bass mat, beginning at the under part of the slit, and so proceed to the top, taking care that you do not bind round the eye of the bud, which should be left open.

"When your buds have been inoculated three weeks or a month, you will see which of them have taken; those of them which appear shrivelled and black, being dead, but those which remain fresh and plump you may depend are joined. At this time you should loosen the bandage, which, if not done in time, will pinch the stock, and greatly injure, if not destroy, the bud.

"The March following" (perhaps April in this country) "you must cut off the stock close to the bud, sloping it that the wet may pass off, and not enter the stock. To this part of the stock, left above the bud, it is very proper to fasten the shoot which the bud makes in summer, to secure it from being blown out; but this part of the stock must continue on no longer than until the bud has acquired strength to support itself, after which it must be cut off close above the bud that the stock may be covered thereby.

"The time for inoculating is from the middle of June to the middle of September, according to the forwardness of the season, and the particular sorts of trees to be inoculated, which may be easily known by trying the buds, whether they will come off well from the wood. But the most general rule is, when you observe the buds formed at the extremity of the same year's shoots, which is a sign of their having finished their spring growth."—*Gardener's Dic*

The buds made use of in inoculating should be those which grow on the middle of a young shoot or scion, taken from the outside of a healthy fruitful tree, and one whose fruit is of the best quality. The shoots containing the buds should be gathered in a cloudy day, or an early or late hour should be chosen. Dr. Thatcher says "the buds should be used as soon after being gathered as possible, and the whole operation should be quickly performed. In taking of the bud from the twig, the knife is inserted about half an inch above it, and a thin slice of the bark, and wood along with it taken off, bringing out the knife about an inch and an half below the bud. This lower part is afterwards shortened and dressed, and the leaf is cut off, the stalk being left about half an inch long. Perhaps it is better to insert the knife about three quarters of an inch below the bud, and to cut upwards; at least this mode is practised in the Scottish nurseries. The portion of wood is then taken out by raising it from the bark, and pulling it downwards or upwards, according as the cut has been made from above or below. If the extraction of the wood occasion a hole at the bud, that bud is spoiled, and another must be prepared in its stead; as gardeners speak, the root of the bud has gone with the wood, instead of remaining with the bark."

AMHERST COLLEGIATE INSTITUTION, March 12. 1821. TO THE PUBLIC.

It having been objected, when a Petition was presented by the Founders and Guardians of this Institution for a College Charter, last Spring, that previous notice had not been given to the Public; and this objection having been at that time urged as a reason for postponing the subject to the Winter Session—to prevent the recurrence of the same objection and delay, the Trustees who have the care of the Institution think proper to give notice, that

a similar application will be made at the next Session of the General Court, and briefly to state some of the grounds, on which they hope and expect that their prayer will be granted.

The Trustees feel constrained to renew their petition, by a sense of duty to the interesting Seminary which Providence has put under their care, by a regard to the high trust reposed in them by its benevolent Founders, and from a conviction, that even the shortest delay would disappoint the reasonable wishes and expectations of thousands, in almost every part of the Commonwealth. They are, moreover, greatly encouraged to persevere, from the consideration that one branch of the Legislature was decidedly in their favor at the last Session, and that there was nearly an equal division in the other. Many, they are persuaded, have heretofore opposed the Institution, from honest, but mistaken views of its character and prospects, who will hereafter be found among its warmest friends; nor can they for a moment doubt, that a full understanding of facts, will secure the sanction of Government, and the general approbation of the public.

While the Trustees explicitly disclaim all intentional interference, with the rights and interests of other Colleges, and intend to res their application for a Charter, on the broad basis of the Constitution and the public good they respectfully ask the attention of a candid and enlightened Public to the following considerations.—

1st. Another College is wanted in Massachusetts. The interest and honor of the State demand it. This has long been felt by men whose numbers and intelligence entitle them to be heard on any subject; and that the now carry with them the public sentiment, more and more apparent every month. Massachusetts at this moment, furnishes nearly sufficient number of students for three Colleges; and the number is annually increasing. Of the 569, now furnished by the State, more than three hundred are actually in Colleges *other States and at Amherst*. Why is this, if we have Colleges enough in the State already? The fact that less than half our students, go to Cambridge and Williamstown is decisive.

2nd. It seems to be admitted on all hands that if another College is chartered, it should be located not far from Connecticut River and near the centre of "old Hampshire." Farther west it certainly should not go, and carry it much farther east, would place it near to Cambridge. If therefore, nothing has yet been done towards the establishment of a College in this section of the State, Amherst would present itself as a spot of most favorable location. As it respects other Colleges it is remarkably central—being about 90 miles from Harvard University, 90 from Brown University, R. I., 90 miles from Yale College, 95 from Union College, N. Y., 55 from Williams, and 100 from Dartmouth, N. H. Amherst, moreover, is situated about 52 miles from the western line of the State, (in the heart of the old county of Hampshire, which furnishes this year 130 College Students and is equally distant from New-Hampshire on the north, and Connecticut on the south. Add to this, the means of living

remarkably cheap,—from \$1 to \$1.25 per week in private families;—the climate is healthy; the surrounding country is delightful; the place is retired from the bustle of business and the incentives to idleness and dissipation, and yet there is ready communication with all parts of New-England. A mail stage passes through the centre of the town, on the northern and southern route every day in the week, (the Sabbath excepted;) and another mail stage passes, four times in a week, on the eastern and western line. Besides these, an accommodation Stage passes every day in the week, (the Sabbath excepted.)

3d. In every thing, both in law and in name, there is already a College at Amherst. The buildings and other accommodations for students are far more extensive, than any College in our Country could offer, at the time of incorporation, or during the first years of its existence as a College. Two excellent brick buildings, each 100 feet in length, and four stories high, together with a President's house of the same materials have already been erected. The Philosophical and Chemical Apparatus is very respectable; and a Library of nearly 1500 volumes has been procured.

4th. The funds of the Institution are believed to be far more ample, than belonged to any of our Colleges, for years after Charters were granted. The interest of these funds is such, as to enable the Trustees to give tuition at a room-rent to a large number of charity students, of different denominations; which, together with the Term Bills of others, will, it is hoped, support a competent number of teachers in the Seminary.

5th. The qualifications for admission, and the course of studies, are the same as at Yale College; and of course, far more elevated and extensive than they have been, in any New-England College, not merely at the time of its incorporation, but for many years after. The students, therefore, are likely to be worthy of college honors.

6th. The present number of students, in the several classes, is 128; which the Trustees have to be unexampled, considering the policy of the Institution, and that it is without the privileges of a Charter.

With all these things in view, and under a constitution which requires the Legislature to cherish the interests of literature and the sciences and all Seminaries of them, it can be doubted, that gentlemen of enlightened principles and liberal feelings, after a full understanding of facts, will extend to it the aid they prayed for; which will cost the Government nothing, but which will be of inestimable value to the Institution.

The foregoing is on a subject of public and general interest, the Editors of New-papers in distant parts of the Commonwealth, are respectfully requested to give it an insertion.

In behalf of the Trustees,

HEMAN HUMPHREY, President.

From the New York Evening Post.

THE QUEEN BEE.

On Saturday, the 22d of November, the Edinburgh Wernerian Society met for the first time this season, and we were happy to see a nume-

rous meeting. The first paper that was submitted to their notice, was on the conversion of the larvae of a working bee into a queen bee, by the Rev. Mr. Dunbar, of Applegarth.—Mr. Dunbar states, that he noticed the operations of a hive, on the loss of a queen: for the first day all was noise and confusion, when the loss was discovered. After this had a little subsided, in consequence of the loss being ascertained, the bees, to avoid a state of anarchy, laid the foundation of five royal cells, and of four more the next day, and placed the larvae of (what is supposed to be) the working bee in them. At the end of fourteen days, a new queen issued forth from one of the cells, and with an instinct equalling Turkish wisdom and policy proceeded immediately to tear open the other royal cells, no doubt with the determination of destroying what was likely to produce a rival to her power. The working bees rebelled against unconstitutional exercise of authority, and hauled her majesty away from her job.—They succeeded in protecting the junior branches of the royal family, and were rewarded for their loyalty by the birth of a princess. But it was of no avail; for the Czarina, who had, as it should seem, a preferable claim, in virtue of the priority of her birth, killed her fair and unfortunate rival.

Mr. Dunbar, in corroboration of the above fact, of the formation of an artificial Queen, narrates an instance of its having been done by an artificial swarm also. A number of bees (not an uncommon circumstance) depended in a large cluster at the door of the hive; he suddenly removed the hive from their sight, and placed another in its room, containing empty cells, having previously taken the precaution of putting into it about three inches square of pure honey comb containing larvae and honey, and the astonishment of the bees was very great when they entered the new hive and missed their rich stores and their beloved monarch, the fair and stately Queen; they bustled about in every direction; but the next day, finding that the royal family had removed, and had taken away the treasury, they began to lay the foundation of royal cells, and in the course of time made to themselves a new queen. Mr. Dunbar has repeated this latter experiment with great success.

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS SOCIETY FOR PROMOTING AGRICULTURE.

Letter from Hon. Col. PERKINS, with a cask of Flax Seed, dated 20th Feb. 1824.

When in Ireland last summer, I conversed with some of the venders of Flax seed, from whom I learnt that the growers of flax preferred the seed from Riga, to that of any other country, after that the seed from Holland, and last of all the seed from the United States, of this the seed from the State of New York had the preference. Upon enquiry I found the Dutch seed was preferred from being more clear of trash than ours, and that the inspection was more attended to in the State of New York, than in Massachusetts—the whole importation into Ireland was 51,666 casks, of which 41,351 came from the United States, 10,392 from Holland, 2000 from Riga—the Riga seed commands in ordinary seasons 20s. to 30s.

sterling more than the Dutch seed, and the latter 10s. to 15s. more than ours, an experiment had been made of sowing in the Autumn, in place of the spring as had been usual. On the 6th of July, I saw flax at Belfast which had been sown in October, four feet and an inch in length. This I understood was from Riga seed. Believing that it might be of some importance, to test the advantage of using the Riga seed, I requested the American Consul, Samuel Luke, Esq. to send me a cask of Riga seed, which has arrived at New York and is ordered here.—It is at the service of the Massachusetts Society for Promoting Agriculture.—I wish however a portion of it reserved for my friend Gen. Derby, who resides at Londonderry, where I understand flax is extensively cultivated, the remainder is at your service for distribution and I hope it may prove a useful experiment.

Respectfully, dear Sir,

your friend and servant,
T. H. PERKINS.

Hon. RICHARD SULLIVAN,
Cor. Sec'y of the Mass. Society for
promoting Agriculture.

At a meeting of the Board of the Massachusetts Society for Promoting Agriculture, held March 13, 1824—Voted, that the thanks of the Society be presented to the Hon. T. H. PERKINS, for his gift of a cask of Flax seed from Riga, and for his repeated attention to the Agricultural interest of his country.

Attest, BENJAMIN GUILD,
Assistant Recording Secretary.

Gentlemen desirous of making experiments with this seed will be supplied with it, by calling at the Assistant Recording Secretary's Office, 81, State Street, and if the Agricultural Societies, to whom a quantity of flax seed was some time since distributed, will report their success, they may also have the advantage of others' experience.

From the Salem Gazette.

HORSE LONGEVITY!!

MR. ANDREWS,—Please notice in your next paper an uncommon occurrence in the age of a Horse, which belonged to Mr. John Oldham, of this town. The Horse died a few days since at the advanced age of 34 years. He had been driven into Salem market, constantly, by the owner himself, for 31 years last past; and what is still more remarkable, his spirits were so great till near his end, that he was generally designated by those who knew him, as Oldman's Colt. Yours, &c. A SUBSCRIBER.

Danvers, Feb. 20th, 1824.

Vinegar.—The vinegar manufactured by all the great establishments in London is made from malt. Most of the Vinegar consumed in Paris, and indeed throughout France, is extracted either from wood or potatoes.

Molasses Beer.—Take four quarts of molasses, half a pint of yeast, and a spoonful of powdered race ginger: Put these ingredients into your vessel, and pour on them two gallons of scalding hot, soft clear water;—Shake it till it ferments; and add thirteen gallons of the same water to fill up the cask. Let the liquor ferment for about twelve hours, then bottle it off with a raisin or two in each bottle.

From the Massachusetts Agricultural Repository.

INDIAN CORN.

TO THE TRUSTEES OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

[Continued from page 260.]

I have the present year, caused the Indian corn, gathered from an acre and twenty-five rods of my corn field, to be measured, and it produced two hundred and twenty-six bushels of ears. A part of it only has been shelled, and two bushels of ears produced a little more than a bushel of shelled corn.

In July 1822, the land was mowed, and yielded about a ton of hay to the acre.

Early in September of the same year, it was ploughed. It remained in this situation, until April, 1823, when it was harrowed. A few days after harrowing, it was ploughed across the furrows about two inches deeper than the first ploughing in September, when it was first broke up. After remaining in this situation a week, it was harrowed thoroughly, until the principal part of the sods were displaced and pulverized. About the middle of May, it was furrowed with a horse plough, the furrows three and a half feet apart, for planting. It was planted about the 20th of May, in hills, three feet and a half apart one way, and one foot and a half the other way.

About eight cords of compost manure were put on this acre, and 25 rods. It was composed of barn yard manure, made in the summer of 1822, hog dung, and the clearing of ditches, in equal quantities. This part of the manure was carted into the field, and mixed in the autumn of 1822. In April 1823, it was shovelled over, and six casks of unsacked lime was equally mixed, and covered in the heaps, which contained about forty cords. After lying about two weeks in this situation, it was again shovelled over, and the lime was found to be stacked and pulverized, and the whole heap had become a fine body of compost manure. Every part appeared to be entirely dissolved and pulverized.

The corn was planted about the 20th of May, and as I before observed, about eight cords of manure taken from the before described heap were carted on this acre and twenty-five rods.—A common shovel full was put to each hill in the furrows which had been ploughed eighteen inches apart. The corn was then planted four kernels in a hill, five inches apart. It was ploughed with an horse plough twice, and twice hoed. After the second hoeing, the ground was left nearly level.

This acre and twenty-five rods was measured from a field of about six acres, the greatest part of which was planted in the same manner here described, which I consider, from several years experience, the best mode of planting Indian corn. On the remaining part of this field the residue of the heap of manure was carted, in about equal quantities to the acre, with the acre and twenty-five rods. Some part of the field was planted in hills three and a half feet apart each way, and some part in rows three and a half feet apart. The part first described yielded the greatest quantity of corn, although the quality of the land, and the quantity and quality of the manure, were the same.

It was my intention to have ploughed and hoed the whole field a third time, but the corn

had become so large, and spread to such a degree, that a horse could not travel through it without injury. There was, however, scarcely a weed or a spire of grass in the whole field. That part planted in rows yielded more than that planted in hills, three and a half feet each way, but not so much as that planted in the manner first described.

No more attention was paid to the acre and twenty-five rods, than to the other part of the field, and it was not done under any expectation of obtaining the society's premium for the largest quantity, or the best mode of cultivating this article. If however it merits any distinction, I shall be happy.

With great respect,

I am your most obedient servant,

WM. HULL.

(To be continued.)

From the Gentleman's Magazine.

UTILITY OF THE LARCH.

MR. URBAN,—Larch, by experiments made, is found to be full as durable for naval purposes as the oak, and is therefore the best succedaneum for it. As I live within sight of the Malvern hills, I cannot help lamenting that they are not planted with Larch, which would thrive well. The same may be said of many spots on the Cotswold hills on one side; and it may also of the Welch hills, on which oak would never grow to any size. How many hills in Surrey, Hampshire, Wiltshire, are too steep for the plough, and so dry in the summer as scarcely to afford a scanty bite to a few sheep, yet, planted with Larch, might become useful ornaments to this country! When passing from London to Portsmouth, the brims of the Devil's Punch-bowl strike the eye as a spot which, thus planted, might become as pleasant an object as it is now disagreeable or frightful in dark or cloudy weather. This idea strikes more particularly as being so near to the great naval repository.

The Larch is equally useful for many purposes in husbandry, and in domestic uses. For the latter it has one quality that renders it peculiarly desirable, viz. that it is the least susceptible of fire of any timber. Added to these useful purposes, it will not take up any grounds fit for the oak, for strong soils are the only ones on which it does not thrive.

These considerations, Mr. Urban, tempt me to send you an account of an easy and expeditious way of raising them, not founded on theory, but on the practice in which willows have been planted in some of the coldest situations in Scotland, where they are of a remarkably quick growth, and yet the wood is very fine grained. The planter has now many trees of his own planting, which are six feet in circumference at the height of three feet from the ground. The Duke of Athol has now Larches, planted in 1743, which are upwards of eight feet in circumference.

The method of getting these seeds out of the cones is, not to gather them till about Candlemas, when they begin to drop off the trees. At the end of April, or beginning of May, sooner or later, as the weather serves, prepare some beds in a nursery, to which the sun has free access, and lay the cones on that bed as thick as they lay clear of one another, and the sun will soon open them, and they will shed their seed. The

owner should, from time to time, examine what quantity of seed they have shed; and as soon as he finds that there is seed enough to fill the ground with plants, the cones should be carried off the ground, and set on them about a quarter of an inch thick of good mould. The cones may then be carried to another bed, and laid as before, and they will fill it with seed in good time to yield plants that season. If the cones are kept dry during the winter, more seed may, in the same manner, be procured next season.

When the plants are two years old, they may be planted in the autumn, or next spring; but the autumn is thought the best, particularly in dry soils; for, if the spring is dry, the ground will be so dry as to kill the plants. They are planted out with a narrow iron spade with which a cross-cut is made to receive the plant.

When the plants stand another year in the seed-bed, or have been a year in a nursery, they then push out to such a height, that it is necessary to dig small pits for them, which is the surest way. The young plants must be well fenced from cattle, especially sheep, which are very fond of them; and, when the head is cut off by any accident, it impairs the heart of the tree to the very root.

As they overtop almost every other tree, they are the more exposed to every high wind; but the quick-growing trees should, therefore, be planted among them; or they may be planted in clumps, so as to protect one another.

Another advantage might attend the planting the dry eminences; that, when the young trees have grown up, the earth is so much shaded that the dews and rain are not so soon exhale by the sun and winds as in open situations. This means the moisture penetrates deeper, it meets with a substance impervious to water, it then descends on that substance till it again reaches the surface and breaks out in spring.

Thus water may be procured in such dry situations, where it may be much wanted for forcing drink to cattle and sheep feeding on the plain grounds below. Some years ago mention was made, in the "Annals of Agriculture" of a method of making ponds in such dry situations, which must be of great advantage. The want of water in extensive plains often obliges the inhabitants to build their houses in the neighborhood of the nearest stream. This distance may create great expense, both in loss of time, and in the carriage of manure, and the articles of growth from such places. Farmers are not at all times sufficiently aware of the value of time thus lost; and, as it is the master's eye that makes the horse fat, so the master's eye may be much wanted in such important spots.

AGRICULTURE.

REMARKS.—The tree described in the above article is, we believe, found in great plenty in the northern parts of New England, as well as in Canada and Nova Scotia. It grows best in poor soils either wet or dry, and the wet lands, which will produce no other kind of useful vegetation are best fitted for this forest tree. In the Massachusetts Agricultural Repository for June 1822, is an account of this tree, written by John Lowell, Esq. Mr. Lowell says it is known by the names of Juniper and Hackmatack as well as that of Larch, and observes that Hackmatack grows more rapidly than the Juniper, commonly called the red Cedar, and

ore durable for posts, than that plant. It will grow on any soil, and rapidly on soils entirely different from those in which it is usually found. have them growing in pure sand, without the last apparent mixture of loam, and on a barren gravel—a gravel, which will scarcely support grass. I have large trees in such soils 18 to 24 inches in circumference and thirty feet high of sixteen years' growth."

Mr. Lowell asserts that the English Larch has been found by experience to be much superior to the American tree of the same genus, being a much quicker growth, and advises to import the English Larch, and some other varieties from Scotland.

Dr. Willich's Domestic Encyclopedia gives a pretty long and very favorable account of this tree, vol. ii. p. 435.

From the American Farmer.

SEEDS.

Albany, February 21, 1824.

Appreciating the importance of good seeds, both to the farmer and gardener, I send you, Mr. Farmer, some hints on this subject, suggested by experience and reading, which may be of interest to some of your readers.

1. To raise good seeds, care must be taken not only to select from the choicest plants, but also, to had or different kinds of the same family. I have not suffered to blossom in their vicinity, as the fecundating farina of the poorer sorts, which is carried by winds and by insects, will deteriorate the seed of the good. Hence, no two kinds of cabbage, turnips, beets, &c. should be sown in seed within ten or twenty rods of each other, and it will be better, if they are sown in different enclosures. And hence, if we would preserve from a fine variety of melons, it is necessary to plant them at a distance from other varieties. The brassica, (cabbage,) family not only mix among themselves, but are said to be affected by the pollen of the cauliflower, kale and turnip.

2. Seeds should be gathered as soon as they are ripe, both to prevent waste and damage.

3. They should be preserved in a dry and temperate place, accessible to air; and, where it is convenient, kept in their pods or husks till wanted for sowing. This may be done, with most kinds of annuals cultivated in the garden. It prevents injury from heat or moisture, and preserves them in a healthy condition. Miller made this experiment. He divided parcels of lettuce, parsley, onion, and other seeds, one portion of which he put into vials which he chemically sealed; the other portion into bags, and kept the whole one year—when planted, not one of the seeds grew, which had been kept in the vials, while all of those which had been kept in the bags grew well. An experienced gardener tells me, that the seeds of many annuals will, if preserved in the pods, &c. retain their vegetative power for two or three years, whereas, if taken out, they will seldom grow after the first year. My experience and observation of the habits of plants, confirm this remark.

4. When should seeds be sown? Repeated failures in the seeds of perennials and biennials, which vegetate, when sown in the spring, led me to consult the economy of nature, and to adopt her laws as my guide. I found that the maple,

beech, ash, and other forest trees—several shrubs, most of the bulbous flower roots, and a large portion of the biennial and perennial flowers, shed their seed upon the ground in autumn, and that the seed thus sown, if slightly covered, vegetated either immediately or in the following spring, and that if these seeds are thoroughly dried, as they must be by being wintered in the house, they either will not grow at all, or lay dormant in the earth for a year or more.

5. The pods of melons, cucumbers and pumpkins, improve by being kept till they are three or four years old. At that age they produce earlier, and more fruit, and run less to vines.—The benefit of age may be partially obtained, by washing the seeds well, when taken from the fruit, to cleanse them from mucilage, or by carrying them loose in the pocket, some days or weeks before they are planted.

6. Wheat is said to be improved, as seed, by being kept a year; and, what is an important benefit, will then produce a crop without smut: Nay, more—I am induced to believe, that the crop will escape from the injuries of the fly also. For I am almost a proselyte to the opinion, that the nit is deposited in the down of the kernel, before the grain is harvested, and that the same warmth which causes the seed to vegetate in the earth, hatches the insect there also. I am inclined to favor the hypothesis, and not without evidence, that the seed of both the smut and the fly, lose their reproductive power during the lapse of a twelvemonth. I will not venture to say, that liming seed is as efficacious against the fly, as it is against smut; but thus much I can say, that I always lime my seed wheat, and never have it injured by smut or fly, while many fields in my neighborhood are annually devastated by the one or materially injured by the other.

7. Seeds may be preserved in a healthy state according to the nature of their essential oil and the nature of the shell or covering, which envelopes the embryo plant. Miller says, "the seeds of cucumbers, melons and gourds, which have thick horny coverings, and the oil of this seed being of a cold nature, continue good eight or ten years; and radish, turnip, rape, &c. with other oily seeds, (whose coats, though they are not so hard and close, as the others,) yet abounding with oil, which is of a warmer nature, the seeds will keep good three or four years; whereas, the seeds of parsley, carrots, parsnips, and most other umbelliferous plants, whose seeds are, for the most part, of a warm nature, and have little oil in them, do lose their growing faculty often in one year, but seldom remain good longer than two years."

8. Steeps. The experiments of Duhamel and others, show that steeping seeds in any liquor, or mixture, with a view of invigorating the germ, is always without benefit, and often attended with injury—the seed containing the best nutriment, and all that is requisite, to extend the root, and unfold the seminal leaves. Steeps may be beneficially used to accelerate germination, to preserve the seed from grubs and other insects, and to destroy the seeds of insects, and parasitic plants, which may adhere to it. Corn soaked in a strong decoction of the roots of black hellebore (sometimes called itch weed,) and strongly saturated with nitre, has, with me, resisted the attacks of insects, birds and squirrels. A steep of tar water, will also protect seed in

the ground. Lime and alkalis are most efficacious in destroying the eggs of insects, &c.—The best method I know of to facilitate early vegetables, is to sprout the seeds, before planting, between two sods of earth, placed in the kitchen corner, and occasionally wet with warm water. The larger kinds may be laid in loose, the smaller wrapped in papers. They will sprout in from 24 to 48 hours. J. B.

TO THE EDITOR OF THE AMERICAN FARMER.

IMPROVED DURHAM SHORT HORNS.

DEAR SIR,—I have less hesitation in sending to you, the pedigree of my improved short horn stock, as you have in the 43d number of the Farmer, noticed the purchase I had made, of a calf begotten in England, by Mr. Champion's celebrated bull BLAIZE, and produced at Wye, by White Rose. You will perceive, that I could have no motive to seek better blood although I was glad, to avail myself, of the liberal intention, of my friend at Wye, to exhibit in Pennsylvania, a very beautiful calf, begotten by the bull, which Mr. Champion says, in his letter to you, of the 6th April, 1822, "is considered the most complete animal I ever bred for symmetry and quality," on a heifer, which he also says, excels for correctness of frame, neatness of bone, and uncommon appearance for milk.

I always considered White Rose, a fine animal; and you may recollect, I proposed to purchase her alone, at the time you offered to me, the bull Champion, and the other heifer at cost. I confess, I have a strong predilection, in favor of Wetherell's stock, not only as he was one of the purchasers of the Comet, and of some of the finest cows at Colling's sale, but as Mr. Williams' extraordinary bull Denton, was bred by him, and as all the heifers of his stock, which I have seen are good milkers. At your suggestion, I applied to Mr. Champion, and offered a price, much higher, than that which, he had received for the bull, you imported, or than he had asked for such an one, as he supposed, would satisfy me. He answered, "I regret it is not in my power to send you a bull, possessing the many qualifications you expect, the description you have given of Denton, it is impossible for me to equal." I proposed to pay to Mr. Champion more than he had demanded, as I did not suppose, that he would send to America his finest bulls, at sixty guineas, at the moment he was selling Brigade Major, and Blaize, at one hundred and one hundred and fifty, upon his farm. I have no doubt from the points, and shape of Wye Comet, and the pedigrees of some of his stock, that he possesses as fine cattle, as any man in England, although I confess, I was of a very different impression, until I had seen this calf by Blaize. If you have any doubt, of the valuable properties, of the "Improved Short Horns," as milkers, quick feeders, and small consumers—I should be glad, to convince you on my farm, that in the early maturity, and all these essential items, their excellence is determined, by the degree of affinity, to the pure blood.

I am, dear sir, most truly yours,

JOHN HARE POWELL.

Pozzilion, Philadelphia Co., Feb. 17, 1824.

We understand there are two men now in this town who sweep chimneys for a small compensation by means of brushes fastened to wires. [Portsmouth Journal.]

NEW ENGLAND FARMER.

SATURDAY, MARCH 20, 1874.

FARMER'S CALENDAR.

The time of year has now arrived in which the Master Cultivator and his *posse comitatus* should be as busy as bees, and as nimble as flying squirrels. But it is not proper that the Lord of the soil, and his phalanx of hired or household assistants should skip about like startled rabbits, without knowing what they are about. There should be method in every movement, and a reason for every step.

But some people spin round and round, like a top twirled by a truant, and attempt every thing without accomplishing anything. They are always in a hurry, though they never make haste, and form as many unnecessary tracks as a spaniel that is cutting capers to curry favor with his master.

Such busy bodies work hard, but not knowing how to set themselves properly to work they bring nothing to pass. They appear like animal machines intended to represent perpetual motion, but though always moving they no more go forward than a squirrel in a wheel, or a mouse in a tread mill. They undertake twenty things at once, but not being able to be in more than one place at a time—owning but one pair of hands, and having but one head apiece on their shoulders they fail to accomplish any one of their undertakings.

Such are the evils consequent to the lack of system in business. In order to avoid such calamities the farmer should have a plan of his work cut and dried before hand. He should do one thing at a time; finish one job before he commences another, and do that first, which first needs doing.

Finish cutting, splitting and piling your wood, drawn last winter. You should always keep at least one year's stock of fuel before hand. It is said by those who have calculated on the subject that dry wood will go twice as far as green wood, and we believe this is correct, at least so far as respects wood to be burnt in the summer for cooking. The Farmer's Assistant says, "In cutting wood short, after it is carted home a saw should be used; as this makes a great saving of the wood, and is at the same time equally expeditious." Some farmers in some parts of the country, make great use of dry white pine for fuel. "This is very difficult to cut with an axe; and two men with what is called a cross-cut saw, (or a saw with two handles,) will saw more of this wood than four men could cut with an axe in the same time. Small sticks however, especially if green are best cut with an axe.

As soon as the frost is so far out of the ground that you can drive a stake you will give your fences a thorough review, and substantial repairs. No man, who is possessed of a spark of sensibility, or a grain of forecast can sleep quietly, or realize any enjoyment during his waking hours, when he knows that his fences are in a low, weak and tottering condition, entirely incompetent to afford security to his crops. The careful farmer will therefore make "assurance doubly sure" by a few extra stakes, and supplementary rails rather than anticipate the shocking sounds of hogs in the corn! sheep in the mowing lot! cows in the cabbage yard! &c.

If you have new fences to build, and timber

and stones are scarce you may as well make post and rail fences. If the ground will admit of it, especially if it is so moist that it would be benefited by draining, you may proceed (as recommended in the Farmer's Assistant) to set your posts on a bank made of the earth of two small ditches thrown up together. If the posts are too small to have holes made through them, the rails may be flattened at the ends and fastened to the posts with spikes, or with wooden pins, well secured.

Mr. Preston, of Stockport, Pa. recommends setting posts with the top parts placed in the ground, and intimates that they will, in that position, last three or four times as long as when the butts are placed down. The same judicious and experienced agriculturist advises, in making fences, always to place the rails with the heart side up. The posts should be set at least two feet in the ground. If those parts of the posts which are to be placed in the ground are burnt in a hot fire till quite black they will last much longer than they would otherwise. Some farmers cut their posts so long, and mortise them in such a manner, that when the lower ends have become rotten they can turn them upside down, and it is said that they will last nearly as long again when managed in that manner.

Get your agricultural implements such as ploughs, harrows, carts, hoes, &c. in readiness for use. These you have doubtless kept under cover during the winter, and they will last longer if they are painted or covered with some suitable composition. "Dr. Lewis," says the Domestic Encyclopedia, "advises all wood that is exposed to the inclemency of the weather, to be coated with a preparation of pulverized pit coal* and melted tar, reduced to the consistence of paint, which he has found by experience to be very efficacious." Covering wood repeatedly with train oil, or other greasy substance will have a tendency to preserve it. Or if more convenient use some cheap sort of paint, such as Spanish brown or red ochre. Where machines are necessarily exposed in the field, a great part of the season, they require to be new painted at least every second year. This applies as well to the iron as wood, which should be kept coated with paint or oil as tar as practicable.

Particular attention should be paid to your cattle especially to cows which have lately calved, or are about to calve. If cows are lean when calving no management afterwards will bring them to yield, for that season, any thing like the quantity of milk they would have yielded had they been kept in good condition during the winter and early in the spring. The Germans in Philadelphia, who supply the market with milk regularly feed their cows at night with short feed during the winter. The disease called the hollow horn, or horn distemper is owing to scanty feed. Roots such as potatoes, mangel wurtzel, carrots, &c. should be given them during winter and early spring, with their dry food, and they will serve both for food and medicine. The quantity of roots allowed to each cow, ox, &c. should be varied according to circumstances, and the quantity and quality of the dry food consumed by them, and the apparent keenness of the appetite of the animals. Cattle, especially if fed with roots, should have a pro-

* Perhaps charcoal would do as well

per quantity of salt. Some advise to place salt under cover, and to let cattle, sheep, &c. always have access to it and eat as much as their appetites crave. Dr. Cooper, editor of the Philadelphia edition of the Domestic Encyclopedia says "A quarter of an ounce of salt per day to sheep and one ounce per day to cows and oxen, is an allowance ample enough."

RIGA FLAX SEED. The attention of Agriculturist will be directed to an article in our paper of this day page 267, respecting the introduction and diffusion of Flax Seed from Riga in the United States, by means of the valuable donation of the Hon. T. H. PERKINS to the Massachusetts Agricultural Society.

AMHERST INSTITUTION. In a preceding page of this day's paper we have given an article relative to the College proposed to be incorporated at Amherst, in this State. The question respecting the propriety of granting a Charter to that Institution we have never examined, knowing that we could never decide upon it. Both parties have a right to be heard, and make their wishes and feelings known to the public, and we have therefore published the piece alluded to, without meaning to express any opinion with regard to a matter, which as respects us is *coram non judice*, [beyond our jurisdiction] as lawyers phrase it.

Insurrection in the State Prison.—On the 12th inst. the convicts in the State Prison, in Charlestown rose in open and determined rebellion against their Officers and the Government of the State. They were not subdued till the appearance of a Company of the United States Marines had paraded in the Prison yard with fixed bayonets.

Prison Limits.—The Legislature of Mississippi has passed a law, declaring the limits of each county to be the prison bounds, and prohibiting the imprisonment of any white woman for debt.

The Greek Boy.—Capt. Partridge, of the Military School, at Norwich, Vermont, has generously offered to support and educate at his own expense, the Greek boy who arrived in this country last year, and whose parents and six brothers were murdered by the Turks at Scio. The lad is now in Baltimore, but will come to this city as soon as the means are raised. A few dollars of the Greek Fund may here be appropriated to send him to Vermont.—N. Y. Spec.

Manumoth Hog.—Mr. John Blair, near Cohocink, in the North Liberties, has fattened and killed a Hog weighing 215 lbs.—length from the nose to the tail 9 1-2 feet, girth 7 1-2 feet.—Amer. Sentinel.

Pure proof and Water proof Cement.—To half a pint of milk put an equal quantity of vinegar in order to curdle it, then separate the curd from the whey and mix it with the white of four or five eggs, beating the whole together; when it is well mixed, add a little quick lime passed through a sieve, until it has acquired the consistence of a thick paste. With this cement, broken vessels, and cracks of all kinds may be mended. It dries quickly and resists the action of fire and water.

FOREIGN.

No intelligence from Europe since our last. The following items are gleaned from the latest London papers which have come to our hands.

A thumb pottle of green grapes for making tarts was yesterday exposed for sale in Covent Garden for six strawberries in large pottles were also at market.

[N. W. Times, Feb. 7.]

The Season.—The continued mildness of the last month has produced a mesagey from the flower garden very seldom combined in this climate; stocks, wall-flowers, and primroses, now accompany the laurentia; lilacs are in full bud. Two or three frosty nights has been all that the month has afforded; the coldest air at eight in the morning within doors was at 34 deg.

the 14th and three following days, with the wind at the north, the air externally was ten degrees lower, than that day the air gradually became warmer, till on the 25th and 26th, the same thermometer rose to 50 at 4 o'clock, and continued fluctuating to 40 during the rest of the month; by Carey's Table we find that the greatest heat at noon was at 54 deg. on the 25th, and the greatest cold at 40 deg. on the 26th; were, during the month, 15 days of fair weather, 6 of rain, and 15 of cloudy. The passing comet being scarcely observable by the naked eye, but in its progress, though not sufficiently approaching Earth to produce any alarming expectation which the superstitious Astrologers are apt to declare! the increase of daylight is now most sensibly felt and acknowledged; and it is curious to observe how correct some of our ancient adages are; particularly relative to this increase of light after the shortest day.

Christmas tide a minute wide,
Twelfth tide a cock's stride,
Candlemas tide an hour wide.

The sun rises on the 21st Dec. the shortest day, at 4 minutes past eight, and sets at 52 minutes after 4 o'clock; making the length of that day only seven hours and four minutes.

Now on Christmas Day the Sun rises half a minute earlier than on the 21st of Dec. and sets half a minute later, which completes the first line.

On a Twelfth Day, 6th Jan. the Sun rises at two minutes after eight, which is six minutes earlier than on the shortest day; and sets 53 minutes after three, which is one minute later; here are twelve minutes gained, which may be compared to a cock's stride, if he be of growth and extend his toes to the extent of his stride; and at Candlemas Day, 24 Feb. the Sun rises 12 minutes after seven, and sets 34 minutes after four, with a fraction increase from the shortest day.

[*Idid.*]

Power of Industry.—It was a beautiful expression of Cæsar, that by time and industry a mulberry becomes a silk shawl; but if the following statement be correct, and I have no reason to doubt it, it affords a still more striking proof of what human industry can accomplish—such a one indeed as a mental philosopher would never have dreamt of. A manufacturer of steel an article may be raised from one halfpenny to 35,000 guineas! A pound of iron costs one halfpenny; it is converted into steel, that steel is made into watch-springs, every one of which is sold for half a guinea, and weighs one-tenth of a grain; after deducting for waste, there is a pound weight 7000 grains; it therefore affords for 70,000 watch-springs, the value of which, at half guinea each, is 35,000 guineas.—*Mechan. Mag.*

Curious Geological Fact.—A few days ago a large piece of coal completely covered with cockleshells was found in one of the coal pits of the late Mr. Thomas, in the neighborhood of Dewsbury, 150 feet below the surface of the earth.

CONGRESSIONAL.

SENATE.—Friday, March 5. On motion of Mr. Adams, of Mass. the President of the United States was requested to furnish such copies of the instructions given to our Minister to France, the correspondence with him, and other information, in reference to spoliation committed on American Commerce, by French vessels from the year 1800, and may be proper to communicate.

HOUSE.—To regulate the transportation of gold and silver coin, specie, and jewels, and carrying of passengers, and to prohibit the receipt of merchandise, in the vessels of the United States was taken up, and the debate postponed.

Monday, March 6. After passing several local bills, several amendments of the Constitution were called for, but no question taken.

Tuesday, March 9. The several resolutions on the subject of Amendments to the Constitution were called for. Mr. King, of N. Y. moved to postpone them indefinitely. On the suggestion of Mr. Hayne, that Benson, of Missouri, who moved one of the resolutions, is so far recovered that he expected in a day to resume his seat, the resolutions were laid on the table.

The bill to appropriate \$125,000 annually, for four years for the purchase of cannon, bombs, &c. and for fortifications was again discussed; and a motion to postpone it negatived 23 to 18, when it passed to be engrossed.

Wednesday, March 10. The bill for the supply of cannon, &c. for the Fortifications passed.

Thursday, March 11. Mr. Holmes offered a resolution for an inquiry into the expediency of providing by law, for an earlier commencement of the next session of Congress than the first Monday of December. Laid on the Table.

The Committee on the Judiciary reported two bills relative to the Judiciary System, which were read the first time.

Horse.—Friday, March 5. On motion of Mr. Tod the following proviso was added to the Tariff bill.—“Provided, that all window glass imported in plates not cut be added to the window glass duty.” Other motions were made and negatived, but nothing decided upon, except the duty of 25 per cent. ad valorem was stricken out.

Saturday, March 6. This day was principally occupied in discussions of the Tariff bill, but the Committee rose without taking the question.

Mr. Baileys presented a memorial from New Bedford, praying an increase of duty on tallow; and Mr. Webster memorials from the tallow chandlers and soap boilers of Boston, against an increase of the duty. Both petitions ordered to be printed.

Monday, March 8. On motion of Mr. Coxe, the Judicial Committee was instructed to report on the expediency of prohibiting by law the employment of any persons except citizens of the United States in any of the departments of Government;—and the Committee of Ways and Means to report on the expediency of reducing the number of Auditors or Accounting Officers of the Government.

The House, in Committee, resumed the consideration of the Tariff Bill. The motion of Mr. Forsyth to strike out the section which provides additional duties to counteract foreign bounties on imports, was, after a debate carried. Ayes 114. Nays 66.

Tuesday, March 9. No business of general interest was completed on this day or the two days next succeeding.

BELLFOUNDER.

The Wonderful Norfolk Trotter, imported July 1822, from England.

WILL STAND THIS SEASON, 1824.

At Twenty Dollars, and One Dollar the Groom. The money to be paid to the Groom at Covering.

This celebrated Horse is a bright bay, with black legs, standing 15 hands high; his superior blood, symmetry and action excel those of every other trotting Stallion. He is allowed by the best judges in Norfolk to be the fastest and best bred Horse ever sent out of that County. He has proved himself a sure foal getter, and his Stock for size and substance are not to be surpassed; they are selling at the highest prices of any Horses in Norfolk.

BELLFOUNDER was got by that well known, fast and highforned Trotter, OLD BELLFOUNDER, out of Velocity, which trotted on the Norwich road, in 1806, Sixteen miles in one hour, and though she broke fifteen times into a gallop, and as often turned round, won her match. In 1808 she trotted Twenty-eight miles in one hour and forty seven minutes, and has also done many other great performances against time.

BELLFOUNDER, at five years old, trotted Two miles in six minutes, and in the following year was matched for 200 guineas, to trot Nine miles in thirty minutes, and he won easily by thirty-two seconds. His owner shortly after challenged to perform with him Seventeen miles and a half in one hour, but it was not accepted. He has since never been saddled or matched.

OLD BELLFOUNDER was a true descendant from the original blood of the Fireways, which breed of Horses stand unrivalled, either in this or any other nation.

BELLFOUNDER is strongly recommended to the public by the subscriber, as combining more useful properties than any other Horse in America, and will stand, during the season, at his stable in Charlestown, where all inquiries, post paid, will be attended to.

SAMUEL JACQUES, Jr.

Charlestown, Mass. March 20, 1824.

Medical Talk of the Day.—We have been informed by a military officer, lately arrived at St. Christopher's, that apoplexy is so common there that the sentries frequently fall down in a fit on their posts. Major Edgeworth, of the 35th, was attacked at breakfast by the disease, and fell suddenly from his chair; but, by the prompt assistance of the regimental surgeon, Dr. Berkeley, he was restored. These men, officers and all, wear stiff leather stocks, and the above surgeon is of our opinion that they produce apoplexy. Our argument against cravats in our first number thus receives additional force.—*Medical Advertiser.*

Pirates.—By an arrival from Havana, at Baltimore, information has been received that sometime in January, a small schooner was captured by an open boat of pirates, from the Isle of Pines, which vessel would doubtless be employed as a piratical cruiser, they having understood that the American squadron was to be withdrawn from the West Indies.

NOTICE.

THE Trustees of the Massachusetts Agricultural Society give notice that JONATHAN WINSHIP, Esq. will officiate as Secretary at the Cattle Show and Exhibition of Manufactures at Brighton in October next;—and they are happy to avail themselves of this opportunity to repeat, thus publicly, their thanks to Mr. Winship for his valuable services in that capacity for several years. March 20.

"O splendentissima Cometa?"
 —*pro bella assai che'l sole.*"
 PETRARCA CANZONE, 12th MA.

Splendid stranger of the sky!

Thou unlook'd for didst appear;

Rapid round the pole dost fly;

Welcome art thou to our sphere.

Along the lofty vaulted way,

As thy majestic course I view,

Thy tresses with delight survey,

Where faint a star oft glimmers through.

Bright-hair'd stranger! in what skies,

What unknown system, distant far,

Does thy out-stretch'd orbit rise?

And whither tend, thou lovely star.

From where creation first begun,

Didst thou take thy distant flight!

To pay your homage to our sun,

And bathe your tresses in his light?

Or to count each sparkling star

That glitters in our hemisphere!

Or view the moon with silv'ry ear,

Her phases change in her career?

Or com'st thou to behold our globe?

Each diff'rent clime, and changing scene,

View her in winter's snowy robe?

In summer's flow'ry mantle green?

Or dost thou floods and earthquakes bring?

Or cam'st to wrap in flames the world?

As round thy lustrous hair doth fling,

In thy eccentric orbit hurl'd.

Splendid stranger! not for this,

Thou sought'st our planetary bound;

Not for mortal's wo or bliss,

Thou warr'st thy beamy locks around.

Not to bathe thy hair of gold

In the effulgent air of light;

Nor on the ear her moon behold;

Or count the stars that dock the night.

Not to view our little earth,

And see successive seasons change,

See nature die, renew her birth,

Dost thou here remotely range.

For he whose guiding hand restrains,

And to one sun our globe confin'd,

Each Comet in its orbit reigns,

By different laws to them assign'd.

No void:—creation all doth fill;

Systems round systems endless roll,

Harmonious to the sov'reign will

Of HIM who form'd, who rules the whole.

Scatter, ye winds, ye dun-rob'd cloud,

Gathering in many a misty fold,

That would the splendid stranger shroud,

With his radiant locks of gold.

Thou moon, full orb'd, withdraw thy rays,

Conceal them with a sombre veil;

For thy fix'd and ardent gaze

Makes the beautiful stranger pale.

Stately, stranger, is thy march!

Turn'd from sun thy long hair streams,

O'er night's blue-bespangled arch,

And girt with his resplendent beams.

FOR THE NEW ENGLAND FARMER.

APHORISMS.

Clashing Pleasures.—Those whose sole business is enjoyment, seldom find what they seek. The pleasures of eating and drinking destroy the pleasures of health and appetite, and the epicure is at last convinced that no pleasures are permanent excepting those which are pure.

Knowledge is not only Power but Virtue.—Whenever the understanding is well principled and well informed the passions will be tame and the heart well disposed. They therefore, who communicate true knowledge to their species, are true friends to the world, benefactors to society and deserve all encouragement from those who preside over the community, and the applause and good wishes of all honest men.

Honesty the best Policy.—Although it is sometimes difficult for integrity to get on, it is generally more difficult for knavery to get off; a knave found out is a rogue ruined, and the poorer a man is, the more necessary it is that he should have the reputation of being devoid of guile.

Praise sometimes Disgraceful.—The praise of a bad man is the severest satire which can be uttered.

Reward due to Merit.—He that rewards merit makes himself meritorious.

RAISING A CAPITAL.

About fifty years back, two young fellows, brothers, went to Jamaica; they were by trade blacksmiths. Finding soon after their arrival, that they could do nothing without a little money to begin with, but that with 60*l.* or 70*l.* they might be able to realize a fortune, they hit upon the following novel and ingenious expedient. One of them stripped the other naked, shaved him close and blacked him from head to foot. This ceremony being performed, he took him to one of the negro dealers, who was so well pleased with the appearance of the young fellow, that he advanced 30*l.* currency on the bill of sale; and he prided himself much upon the purchase, supposing him to be the finest negro on the island. The same evening, this manufactured negro made his escape to his brother, washed himself clean, and resumed his former appearance. Rewards were then in vain offered in handbills, pursuit was eluded, and discovery, by care and precaution, rendered it impracticable. The brothers with the money commenced business, and actually returned to England not many years since, with a fortune of 20,000*l.*—Previous however, to their departure from the Island, they waited upon the gentleman, from whom they had received the money, and recalling the circumstances of the negro to his recollection, paid him both principal and interest.

Reminiscences.—A writer in the Plymouth Memorial among other incidents of the revolutionary war and the troubles that preceded it, relates the following anecdotes.

Those gentlemen who were honored by the appointment of mandamus counsellors under the royal government soon found themselves subjected to all the obloquy of popular prejudice, and to the reproaches of friends and connexions. A very respectable gentleman in this town after

having accepted of the appointment, attended public worship on the Sabbath. Immediate on his appearing a number of the principal inhabitants left their seats and retired. So greatly did this incident affect the mind of this amiable man that on the next day he resigned his office. At Bridgewater a much respected gentleman, who was deacon of a parish, was also appointed a mandamus counsellor. During divine service on a Sabbath, where it was customary in singing for the deacons to read the hymn line by line, the minister read the first line, the choir followed in time as usual, but when deacon E. read the second line no voice was heard from the choir; he repeated the reading but all were silent, until another deacon officiated in his stead, when the choir immediately performed the singing service. Unable to brook this pointed rebuke, deacon E. the next day voluntarily exiled himself and never after visited his native town.

A Miss Crackham, from Palermo, was exhibited in Liverpool, England, lately, as a wonderful natural curiosity. She is 9 years of age, inches high, and weighs less than three pounds—is in perfect proportion, walks and talks, has the use of all her faculties.

VALUABLE STOCK FOR SALE BY THE SUBSCRIBER.

A VERY superior MALTESE JACK ASS, 7 years old, 14 hands high, remarkably well made, at quiet in his temper, that a child can manage him was obtained of the Governor of Malta and imported Capt. Robert B. Edes.

Also two BULLS 22 months old out of good cows, they are well formed and gilt six feet in Price \$100 each.

Also one BULL 23 months old, out of the famous *deney* cow, imported by John Hubbard, Esq.

Also the Bull YANKEE, 34 months old out of a fine native cow owned by Mr. Francis Amory. I received a premium at Brighton Show in October Price \$125.

The above Bulls are in fine condition and were four sired by the noted Improved Durham Short Bull *Calebs*.

If the Bulls are not sold by the 20th of April they will be let on shares.

SAMUEL JAKUES,
 Charlestown, Mass. March 13, 1824.

BRISTOL CROWN GLASS.
 150 BOXES Bristol Crown Window Glass, of superior quality, just received and for wholesale and retail, at the very lowest prices, by BRIGHAM & DELANO, No. 30, Union-street, Boston, March 13, 1824.

PUBLISHED BY WILLIAM NICHOLS, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. II. BOSTON, SATURDAY, MARCH 27, 1824.

No. 35.

ADDRESS

delivered before the Albany County Agricultural Society, at their Fifth Anniversary, October 15, 1823. By DR. CHESTER.

These as they change. Almighty Father, these are but the varied God. The rolling year is full of thee. Forth in the pleasing spring thy beauty walks. Thy tenderness and love—Vide tush the fields; the softening air is balm; Echo the mountains round; the forest smiles, and every sense and every heart is joy. Then comes thy glory in the summer months—thy bounty shines in autumn unconfined and spreads a common feast to all that lives. A winter, awful thou—

"Thou bidst the world adore." THOMPSON.

"Non Dominus, sed colonus." SENECA.

The march of improvement, in this highly ordered land—in all the departments of person, comfort, domestic economy, and national attainment, is the wonder and admiration of the world. As a country, the United States has placed herself high upon the catalogue of nations, and by her immense physical resources, her spirited enterprise—her intellectual cultivation—by her arts her commerce and her arms—has deserved and secured the respect of mankind.

ere liberty dwells, and sheds its propitious influence upon our character and prospects as a man. Moral and physical causes combine to render our country one of the most favored that the sight of heaven visits. Every citizen who appreciates his blessings—every christian who is warmed with gratitude will exclaim with the shepherd King,—"Truly the lines have fallen in pleasant places, and we have a goodly heritage."

rising to this society on this joyous anniversary, I feel unusual diffidence. I do not forget that this place has been occupied by eminent and respectable men in our community, who had every claim to your attention and purity of character, dignity of station and extensive abilities and learning. I have not forgotten that I am called to labor in a spiritual field, to cultivate plants of righteousness, to reap the harvest for the garner of God;—to urbane those who have adorned the bench, and the hall of legislation, and given character to the bar, have devoted themselves to promote the honor and usefulness of this society, have been encouraged to follow them, at a humble distance, to endeavor to unite the blessings of religion, with the influence of science and the progress of improvement.

We are generally insensible of our common blessings. Their frequency and profusion, lessen their value in our esteem. The light of day, its bounteous air—the springs, the rivers—sleep, appetite, and health—the fullness of all necessary things, food and raiment—shelter and friends—those we may all enjoy—they are so much things of course—so common—abundant—so incapable of being monopolized, so free to all, that we seldom value them as they deserve. While we forget to appreciate, or to be grateful for them, we live in the poisonous pursuit of imaginary good, in seek-

ing luxuries and hurtful gratifications. We loath the cup which nature has filled, and turn from the table which her hand has spread for every living thing. In meeting such a society as this, at the season when our garners are full, when our paths drop marrow and fatness, and the year is crowned with the goodness of the Lord, our obligations to be grateful, our motives to be contented, are so obvious and pressing, that we cannot fail to urge all its members to heartfelt praise, while we contemplate for a few moments, some of those topics which appear appropriate to the speaker and the occasion.

In considering the present state and prospects of our country, we are naturally led to remember our history. It is but a few years, since our whole country was one vast wilderness, in which civilization and culture were unknown—fewer still since the struggle for our national existence and liberty. Since the period of our independence, the progress of improvement has been greater, than among any people that ever lived. Here enterprise and industry have supplied the place of capital and experience; ingenuity and economy have furnished that which learning and wealth have secured to their possessors in older countries.

Our commerce has been wonderfully extensive and successful. From the smallest beginnings, it rose to distinction. The navy was its first born, and now our maritime power is every where respected, and can be rendered formidable whenever the nation shall require it for protection, or conquest.

Domestic manufactures, the monument of the wise policy of a free and virtuous people, have been followed by extensive establishments equally honorable and beneficial. When they shall enjoy the patronage of government as extensively as they deserve, they will compete with the old world, and enjoy their reputation and profit, without the train of evils, which surrounds and corrupts the work shops of Europe.

The mechanic arts have advanced with a celerity and triumph, unparalleled in their previous history. The principles of science have been successfully applied to all useful instruments, to all labor-saving machines—to the most common and simple operation, and at this moment ingenuity and learning are combining their efforts for the good of mankind. We can sustain unmoved the unjust taunts of our enemies abroad, while we enjoy at home the labors of *Fulton, Whitney and Perkins*, and enroll their names among our patriots and benefactors.

A new monument has recently been erected to the wisdom and enterprize of this state, and while it records our honor will distinguish our age. The project which has interested the attention of the civilized world is complete, and more than three hundred miles of artificial navigation is in successful operation, bearing on the bosom of its waters, the products of our skill and the fruits of our fields. Industry, is stimulated by prompt and ample reward, and improvement and success are simultaneous.

In improvements like these we are all interested. The patriot, because he beholds the wealth and power of his country increasing—the citizen, for he sees the means of subsistence multiplying—the true interests of refinement, of learning and public happiness advancing—the christian, for he sees in all new facilities of intercourse—in all accumulations of wealth—in all advances in intelligence, the certain indications of that day in which "the ploughman shall overtake the reaper, and the wilderness shall blossom like the rose." Yes! the christian beholds in all these improvements the preparations for the introduction of that period when the desert shall bloom as Eden, when every valley shall be exalted, and every hill shall be brought low, and a highway shall be prepared for our God.

Among the most important institutions of the age, agricultural societies are to be ranked with honor, by every sound statesman and every wise man. They are exerting a most beneficial influence, exciting public attention to the most important subject, and directing the public energies and industry to the most successful results. They are founded in public want, with the approbation of public discernment and wisdom. They embrace the most useful and important class of our fellow citizens.

Agriculture is the basis of national strength, prosperity and happiness. The well informed farmer is the benefactor of his country—the source of its power—the maker and administrator of its laws—the patron of its learning, the fountain of its wealth, its defender and its glory.

I address such on this occasion with true respect, and solicit their attention while I attempt to point out some of their privileges and duties, as the free and independent yeomanry of our country.

Your privileges growing out of your occupation, are inexpressibly great. The employment itself is dignified. Some of the best men of history have followed the example of our first parent, and in the sweat of their faces, tilled the ground. The employment was assigned by God himself to man, even in his innocence, and it is continued to us in mercy in our fallen state, not only to supply the wants of the human family, but to promote the truest honor and felicity of its members. It is conceded that it is laborious, but man must have occupation or be miserable. Toil is the price of sleep and appetite, of health and enjoyment. The very necessity which overcomes our natural sloth is a blessing. The world does not contain a bribe or a thorn that divine mercy could have spared. We are the happier with the sterility which we can overcome by industry, than we could have been with spontaneous plenty, and unbounded profusion. The body and the mind are improved by the very toil that fatigues them, and that toil is a thousand times rewarded by the pleasures which it bestows. Its enjoyments are peculiar, no wealth can purchase them, no honor can win them, no indolence can taste them.—They only flow from the exertion which they ever repay.

"These are thy blessings, industry? rough power!
Whom labor still attends, and toil and pain;
Yet the kind source of every gentle art,
And all the soft civility of life."

Agricultural pursuits are eminently friendly to intellectual attainment, to learning and science. The state itself is favorable for the cultivation of letters. No improvement of the mind has ever been found where the cultivation of the earth is neglected. Poetry and the arts have ever been connected with pastoral life, and always begins to flourish in rural scenes.—A savage state where subsistence depends upon the precarious supply which the water or the hunting ground furnish, is absolutely hostile to intellectual culture, to the arts and sciences.—The elegance of the mind—commerce, literature, and even liberty itself, are the fruits of agricultural skill, industry and success. They are supported by them and depend upon them. When they cease, the others are destroyed.—When more is raised than the cultivator consumes, the surplus supports the merchant, the manufacturer, the artist: and those engaged in professional pursuits. The farmer, alone, is truly independent, and if he is wise, he will by his own industry and economy, preserve in his own hands the very elements of liberty, and have no wants that his own farm cannot supply.

The progress of luxury will benefit him, if he does not suffer it to invade his own precincts. In proportion to the real or artificial wants of others, the value of his labor rises. It is only when he himself becomes the victim of *fashion and style*, that he loses his dignified independence in idle wants and preposterous ambition. If he emulates the extravagance of the city in his dwelling, his equipage and his dress; if he assumes the style of the effeminate victims of pleasure, he will enjoy the ridicule of the wise and sink to utter insignificance and unpitied ruin. And why should you not be content with the abundant blessings which a most beneficent father has given you. You have within yourselves every thing really necessary, every thing comfortable, every thing that can promote the most dignified enjoyment of a rational being.—Look around you, you have the most favorable opportunity to enjoy liberty, to gain information and happiness. The means of support are ample, and many luxuries are within your reach. You have a most favorable location—the soil is sufficiently fertile—you are near market—you can with great ease exchange all your surplus produce into money.

It appears to me to be a mistake to consider this county as inferior, in point of situation and soil, to the best agricultural districts in this state. With proper culture, almost the whole of it may be changed into a garden; some parts of it are peculiarly beautiful and fertile. The farms on the Norman's kill, on the Black creek—very many at the foot of the beautiful mountain which ornaments the county, many upon it and over it—those that stretch along the Hudson, north of this city, may compare with any for richness, fertility and profit. Those, not distinguished as grain farms, are uncommonly fine for grazing and the dairy, and nothing is wanting but skilful industry, to find a rich reward in any portion of this favored region.

In contemplating the recent valuable improvements in this county, since the organization of this society, we may confidently anticipate great

er and increasing benefits. Farmers and domestic manufacturers enjoy many advantages in this county. No other society is able to offer so many valuable premiums. The truly noble appropriation of the President,* at once the evidence of the wisdom and benevolence which he has ever devoted to the service of improvement and humanity, together with the bounty of the state and the contribution of the members, make the motives to a generous emulation to excel, peculiarly attractive.

While there is much to praise, and much to excite hope, it is not to be disguised that there is still a want of attention to some of the interesting parts of good husbandry. So much has been well said on former occasions, so much has been written to which all have access, that I will not venture into details which have been amply discussed and appreciated. I would rather confine myself to those things which relate more particularly to your personal honor and comfort, and the convenience and enjoyment of those who depend upon your skill and industry, or if I may use the expression to the "*Morality of Agriculture.*"

It is not to be concealed that there is too much neglect of domestic manufactures and good gardening.

It is true economy and independence to make as many of the fabrics you use, as possible.—This is the peculiar province of the women, to which they will do honor, if you will encourage them. It requires no law of Congress to aid household industry. You can make *your own laces* by your own *fire sides*, and your wives and daughters will discuss all the questions connected with the subject, with good sense, and with a *brevity* worthy of imitation. Solomon has given us the description of a woman, that agricultural societies would do well to honor.—Many such may be found in our county. The last chapter in Proverbs, contains her full picture. I can only exhibit a small part of it on this occasion. "The heart of her husband doth safely trust in her. She will do him good and not evil all the days of her life. She seeketh wool and flax and worketh diligently with her hands. She layeth her hands to the spindle, and her hands hold the distaff. She stretcheth forth her hands to the poor. She is not afraid of snow for her household are clothed.—Her husband is known in the gates. She maketh fine linen. She openeth her mouth with wisdom, and in her tongue is the law of kindness. She looketh well to the ways of her household and eateth not the bread of idleness. Favor is deceitful and beauty vain, but a woman that feareth the Lord she shall be praised."

There is nothing more conducive to the health and comfort of a family, than a good garden well stocked with fruit and vegetables. Unhappily, many respectable farmers have considered the subject unworthy their attention, as of too little importance to occupy their care or employ their labor. They have undoubtedly mistaken the true economy as well as the true enjoyment.

With little pains or expense, every farm house might be surrounded with cherries, peaches, pears, plums and grapes in all their varieties and perfection. The whole season might be filled with the best of fruit, and health would be promoted and established by its free

* Hon. Stephen Van Rensselaer.

use, and the appetite innocently gratified. I side if fruit were more abundant, the use of dent spirits, which are worse to a farm than "mildew" and the "east wind," would be lessened, the fashionable dyspepsia would be confined to the cities, and the curse of intemperance would be driven from the land. No city would be more profitable, for nothing is so eagerly purchased, at a price far above its intrinsic value, as fruit. This county, in many parts is favorable to the growth of peaches. During the past season, one farmer from a single orchard, has sold more than two hundred and fifty bushels, at a clear profit of \$300. Our people orchards might be rendered much more productive and valuable, by attention to the selection and in grafting the fruit. Every boy of years of age, should perfectly understand the simple art of engrafting, if this state is not associated with early habit, it will never be sufficiently powerful to produce vigorous exertion in maturer life.

This subject is worthy of the attention of young farmer. If you begin to plant fruit in early life, you will soon enjoy their benefits. You may shelter your old age under their branches, and behold your children reaping the comfort of your providence and care.

The attention to horticulture is important to health, convenience and comfort. The subject is too extensive for minute discussion and mention it rather to excite attention, than give advice—but if every farmer would do justice to his garden, be careful in the selection of his seeds, and raise all the varieties which the climate would produce, his table might be the envy of an epicure, though it contained nothing that was not gathered by his own hand. His granary, cellar, orchard and garden, would supply a daily feast which no foreign market could rival. The tropics cannot yield either fruit, or vegetables that will on the whole, compare with ours. I have sometimes thought we were more anxious to imitate the garden of Eden, we might enjoy more of its innocence.

It is not unworthy of the farmer to pay attention to the cultivation of flowers. Nature has made them "beauty to the eye," and loaded them with fragrance for our pleasure. From these the busy bee, "patroness of industry," collects her richest sweets, and labors your gratification and support. Let not the farmer grudge a little spot to his daughter, for their culture. A taste for them springs from nature, and is wise and grateful; when it is properly regulated, it is generally attended with thrifty neatness, almost allied to virtue, when attended with such a knowledge of botany, as may easily be obtained, it is highly beneficial to rural economy. A nosegay is the appropriate ornament of the female of the farm, and is much more becoming than lace and jewels. The rose tree may well supplant the idle thorn, and romantic plants displace the unsightly myrtle. No man is poorer for an ornamented country. Simple beauties have a tendency to refine, and absolutely contribute to thrift and enjoyment. Human happiness depends upon little things, far as outward circumstances are concerned, wise and dutiful to diminish all we can of evil, increase all we can of good, the more we cultivate of innocent taste the more we may enjoy—

For not a beauty blows
And not an opening blossom breathes in vain.

The cultivator then if he be frugal, industrious and contented, enjoys all that the bounty of providence has to bestow upon his mere animal nature, but this is the smallest portion of his blessings—his situation is peculiarly favorable for patriotism—he may enjoy in its greatest perfection true liberty—he is its earliest advocate and its latest defender—he is not exposed to the litigious corrupt ambition, which leads some to stray.—When the cultivators of the soil are with the best friends to freedom, its temple and altar will perish in the land.

Your situation is not only favorable for domestic, social and public happiness, but for the cultivation of morality, and the attainments of intellectual riches. Upon this subject, you ought not only to feel your importance, but to be diligent in the discharge of your duties. You can neglect nothing with so much danger as the education of your children—with instruction to their instruction, their minds will embellish the field of the sluggard, they will be filled with weeds. That inspiration of the Almighty, which gave man understanding, has made the mind capable of the highest attainments.—It is like a rich soil, it will produce in abundant abundance, and if the good seed is not sown and carefully nurtured, it will be filled with noxious weeds. Its native strength and fertility, is the reason why it should be most assiduously cultivated. No farmer expects to see a golden harvest waving over the finest soil that is uncultivated and neglected: there he spends his greatest labor; he guards it from invasion, and is continually exterminating all that is evil. The mind is the intellectual soil, it must be educated. Here you must plant the good and root out the evil.

Common schools, of a much higher order than are generally found, ought to be patronized and supported. The wise munificence of our state authorities, when connected with the intrinsic importance of the subject, should persuade you to make a general and vigorous effort to promote common schools, and establish higher and more liberal ones. The means of instruction must be furnished; men of character and erudition must be employed, and the mind of the scholar must be cultivated with faithful diligence and skill. Rely upon it, in this age, information is both exact and extensive, is necessary to the successful prosecution of agriculture. It is essential to retain your sons at home, and to exact from them severe labor during their minority, and then dismiss them to a new wilderness to seek their support, ignorant and unfurnished.—There are many portions of the year when you may enjoy leisure to gain knowledge; the long winter evenings may be devoted to the pursuit of science. If you have accomplished teachers and good social libraries, which every town ought to possess—well selected books will embellish their time to the greatest advantage and fill them with much higher pleasures than the riot and dissipation which are too often substituted for them. It is a false opinion that science is not important to professional pursuits; it has the direct application to all you do, and domestic economy might be greatly promoted by its cultivation. Besides, the pursuit of knowledge, if there are general among our rural friends, would produce many useful associations, would promote good neighborhood and refine and exalt the community.

For happiness and true philosophy
Are of the social, still, and smiling kind.
This is the life, which those who fret in guilt
And guilty cities never know, the life
Led by primeval ages uncorrupt,
When Angels dwelt, and God himself, with man.

If you connect with the advance of true learning, THE KNOWLEDGE of God and the hope and practice of pure and undefiled RELIGION you will complete the sum of your duties and enjoyments in this state of trial and discipline. Your situation is peculiarly favorable for the cultivation of piety. You are not exposed to the temptations which often seduce and destroy others. You above all men, are called to behold the wisdom and faithfulness of God. Seed-time and harvest continually recur, and the dew and the sunshine, the early and the latter rain are forever given. In every plant you see an exhibition of Almighty power. The wood—the field—the loaded trees—the ripened harvest, all proclaim the goodness of him who openeth his hand and satisfies the wants of every living thing. Oh should you not praise and serve him, is there not a most solemn demand upon you to reform your neglect of your Divine Benefactor.—In so fertile a region, blessed with plenty, health and security; ought not the temple dedicated to his service to be more frequently seen; ought not the silence of the Sabbath morn in which man and beast rest from their labors to be more frequently interrupted by the sound of the “church going bell,” inviting the peaceful inhabitants to the House of Prayer—the service of the sanctuary, and the praises of the Lord.

My friends, let us remember that the pursuits that now interest and occupy us will soon terminate. We are hastening to a state of immortal existence. Are we prepared for it? When the angels are sent to gather the great harvest for God, shall we be among the tares or the wheat? Let us be wise and improve this precious season, and live for heaven.—If we do not, we shall at last be left to lament in language which you perfectly understand—“The harvest is past! the summer is ended! and we are not saved.”

NEW WHEAT.

Extract of a letter from Jonas Seely, Esq. a member of the Legislature, to an agricultural gentleman in Albany county.

ALBANY, Feb. 6, 1824.

“SIR,—In answer to your request on the subject of a new kind of wheat, lately cultivated in Seneca county, I really consider it a great acquisition to our country. It resembles in colour the bearded thorn wheat, the berry rather smaller than the white or red chaffed wheat, and weighs from 62 to 64 lbs. a bushel. I have made experiments, and have given it a fair trial on different soils, from clay loam to a black rich soil. It possesses two very important properties which our common wheat does not. It resists frost much better, and is absolutely invulnerable to the attack of the Hessian fly; this was abundantly proved the last season. On this account it is alone invaluable, as I had fields of wheat nearly destroyed by the fly, while this new wheat side by side was untouched.

The common wheat when not injured by fly or frost will produce some more per acre. The new wheat grows thick on the ground, the colour of the straw is lighter and softer and does not grow as tall as common wheat, the heads

are shorter, but fill well, the chaff is light. The flour is equal to the common red berried wheat I sold 70 bushels of it to Col. Mynderse, at the Seneca Falls, last December, his miller pronounced it the finest lot of wheat he had purchased since harvest, it was sowed the 17th Sept. 1822. It was first introduced into Seneca county 5 or 6 years ago, and is called beaver dam wheat, under an idea it was first brought from a beaver dam near Utica, whereas, Col. Mynderse informed me that it was imported from Spain by Elkanah Watson, Esq. of Albany, and was one of the various samples of wheat he distributed over the country 6 or 7 years ago.”

Albany Daily Advertiser.

Upland Rice.—We noticed some months ago the introduction into France of the rice of Cochinchina. It appears from a letter of Mr. Jefferson, recently published, that he procured a cask of this rice more than thirty years ago, and that it succeeded well in Virginia, Georgia, and Kentucky. We trust that some of our enterprising citizens will introduce this invaluable article of food into Massachusetts. Lt. White, of the U. S. navy, who visited Cochinchina in 1819, says there are six kinds of rice cultivated in that country, two sorts of which are upland or mountain rice, from which a most beautiful, fine, snowy, white flour is made, and used in cakes and various kinds of confectionary. These latter species produce but one crop in a year; some of the others produce two crops in a year [Hampshire Gazette.

Something Valuable.—“We have seen within these two or three days, a machine invented by Mr. Joseph Harmer, the great value of which consists in the facility by which all different articles of food requiring culinary preparations, may be rapidly, almost instantaneously prepared in the course of a minute or two. The mechanism is simple, yet philosophical; a few drops of spirits or of alcohol—scarcely a cent of expense, is sufficient to put the whole in operation, and beef steaks, mutton chops, veal cutlets, eggs, ham and venison may be got up adapted to the most epicurean appetites.”—Richmond Phenix.

Water Proof Cloth.—A chemist of Glasgow has discovered a simple and efficacious method of rendering woollen, silk, or cotton cloth completely water proof. The method adopted is to dissolve caoutchouc in coal tar oil, produced in abundance at the gas works; by a brush to put five or six coatings of this mixture on the side of the cloth or silk on which another piece is laid, and the whole passed between two rollers. The adhesion is most complete, so much so, that it is easier to tear the cloth than to separate it from the caoutchouc.

Caution.—It is stated, in a Providence paper that brown cotton sheetings and shirtings of fine thread, but poor stock are frequently imported, which are bleached in this country, and stamped with the names of American bleachers, to pass them as American fabrics. The difference between the true and spurious cloth is, that the former are always stamped with the names of the maker, as well as bleacher. The latter with that of the bleacher only.

Greenland, N. H., March 12, 1824.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

SIR,—It has not been in my power to send you the following plan and description of my Harrow before the present time.

This Harrow combines the following good properties. It is strong. It is less liable to be choked with sods or stones, than any other Harrow, which cuts the ground as finely and is in use in this country, or is described in any agricultural books, which have come to my knowledge. It is easily cleared, when choked. It is so well balanced, that it needs no additional weight to keep any part of it to the work; and it cuts all the ground, over which it passes, at equal distances. It cuts deeper into the ground, than harrows, whose teeth are placed nearer each other. It is an improvement on one, which I invented in 1818; and has been used by me, and many other persons in this and several other towns, since the spring of 1820. As its excellence arises from form, it is important, that this should be carefully preserved. Some persons have adopted a mutilated form of it; and, by shortening the inner beams, and inserting more teeth in the outer ones, have destroyed the proper balance of their harrows; and rendered them much more liable to be choked, than those are, which are made agreeably to the plan.

Joists $3\frac{1}{2}$ inches square, or $3\frac{1}{2}$ by 4 of oak, or 4 inches square of elm, will be sufficiently large for the beams of a common field harrow to be drawn by two horses. A harrow made on this plan, having its teeth sufficiently near, and having suitable handles answers an excellent purpose for harrowing between the rows of corn, potatoes, and other vegetables.

To form this harrow let the outer beams be butted together at *A* so, as to form with each other an angle of an equilateral triangle; or in other words so, that the teeth at *b* and *d* may be at the same distance from each other, that they are from the tooth at *a*. The distances between the teeth in the several beams must be equal; but may be greater or less at pleasure. The

distance between the teeth in a field harrow may be a foot. But six or seven inches, is sufficient for the distance between the teeth in a harrow, designed to be used between the rows of corn and other vegetables. The spaces between the traces, cut in the ground by the teeth, will be only one quarter as great, as the distance between the teeth in the beams. The hindmost teeth in the harrow, that is used between the rows of corn should be made so, as to be fastened by a screw and nut at top so, that they may be taken out, if necessary, to accommodate the harrow to narrower spaces in the latter stages of cultivation.—The inner beams should each be parallel to one of the outer ones, and tenoned into the other at *c*, so, that the line, in which the teeth are inserted into them, may intersect the line of the teeth in the outer beams exactly in the midst, between the second and third teeth from the foremost one. Let the inner beams be halved together at *g*, where they intersect each other. From the point *c*, where the line, in which the teeth are inserted in the inner beams, intersects the line of the teeth in the outer ones, set off on one of the inner beams, at the distance of the teeth in the outer beams, as many places for teeth, as there are teeth in either of the outer ones; and on the other one mark the same spaces; but do not insert teeth in the two forward places. Let a bar *o o*, of suitable width and an inch or more in thickness, be passed through all the beams immediately before the hindmost teeth in the outer beams, and behind the third place of the teeth in the inner beams. If it be of suitable width and properly inserted, it will not interfere with the places designed for the teeth. Let a similar bar be passed through the inner beams, between the two hindmost teeth, at *d d*. Fasten the two outer beams, where they are butted together by a trennel at *e*, and at a little distance behind the trennel insert an iron bolt at *h* to receive the hook of the chain, by which the harrow is to be drawn. Let the tenons and the bars be suitably pinned; and let the teeth be inserted in the places designed for them. For scarifying ground not ploughed, teeth made flat and sharp like the coulter of a plough and inserted so, that their sharp edge may be drawn directly forwards are better, than the square teeth, which are commonly used.—It must be obvious to every one, who considers the principles, on which this harrow is constructed, that it may be made larger or smaller, and with a greater or less number of teeth according as the object, for which it is designed may require.

Your obedient servant,

EPIKRAIM ABEOT.

From the Massachusetts Agricultural Repository.

Newbury, Nov. 15, 1823.

TO THE COMMITTEE ON INDIAN CORN.

[Continued from page 260.]

GENTLEMEN,—The following is a statement of the cultivation and production of an acre of Indian corn raised by the subscriber in Byfield the present year. The soil is a dark loam and very fertile, perfectly free from stones, and quite level. In 1822 it was planted with corn and produced equal to one hundred and eighteen bushels. In April, 1823, there was about seven exact loads of barnyard manure spread upon the acre and ploughed in. The first of May it was

again ploughed and holed three and a half feet apart, and eight loads of compost manure from the hog yard were put into the holes. The depth of ploughing both times was about six inches; five grains of corn were placed in each hill on the manure and covered with a hoe. The corn was of the eight rowed kind, and weighed when gathered fifty-nine and a half pounds to the bushel. It was hoed three different times, the plough was used the first and second time hoeing; the third time the hoe only was used. It may be proper here to observe, that at the second hoeing the number of stalks in each hill was reduced to four, and in consequence of some high winds it was observed at the time of topping the stalks, that the average number of stalks remaining would not exceed three and a half. The stalks were topped about the middle of September, and I consider the value to be equal to two tons of English hay. It was harvested the middle of October, and there were one hundred and ninety nine bushels of ears, which made by estimation one hundred and thirteen and a half bushels of shelled corn. The expense of cultivation, estimating labor at seventy cents per day, will be as follows, viz.:

April 20,	15 loads manure at \$1 per load	\$15 00
May 6,	Ploughing	1 4
May 6,	Cross Ploughing	1 4
" 8,	Putting manure into holes & planting	2 1
June 3,	Hoeing first time	1 0
" 12,	Hoeing second time	1 0
" 20,	Hoeing third time	7 0
July 10,	Destroying weeds	3 0
Sept. 9,	Topping stalks	2 11
Oct. 14 and 15,	Harvesting, measuring, &c.	5 6
		\$30 61

Yours respectfully, JOHN LEES.

Newbury, Nov. 26, 1823.

TO THE TRUSTEES OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

GENTLEMEN,—The following is a statement of the cultivation and production of a lot of Indian corn raised by the subscribers in Newbury. The soil as to quality is similar over the lot, of a clay loam, and had been mowed three years. In November, 1822, there was drawn on to one half of the lot twelve ox cart loads of yard manure, spread on the grass stubble, and then ploughed; the other part was not ploughed until May, 1823. The part that was ploughed in the fall was then cross ploughed, then harrowed; the whole lot which contained about two acres was then holed about three and a half feet apart.—There was ten cord of compost manure put in the holes on the whole lot, and was planted between the 15th and 25th of May, with five grains in each hole on the manure and covered with a hoe; the corn was the eight rowed yellow kind, selected the fall before from the most fruitful stalks. It was hoed four times: the stalks were topped about the 20th of September. The suckers were taken out at the same time. About the 20th of October there was one acre staked off by a surveyor, which acre was gathered, husked and measured; and there was two hundred and thirty bushels of ears, and a fraction over. Six bushels of ears were shelled, and it produced three bushels of shelled corn, from which there was one hundred and fifteen bushels and one quart of sound corn from one acre of land. The other part of the lot which was not ploughed till spring and no ma-

ploughed in, but managed otherwise alike, gathered soon after the other, and produced about one hundred bushels to the acre. The work of cultivating and harvesting the above was about twenty days work to the acre. The part that was ploughed in the fall and cross ploughed in the spring worked as much lighter through the summer as to repay the extra ploughing. The weight of the corn was fifty-eight pounds to the bushel. The stalk and straw we estimate equal to one ton and a half of good hay from one acre.

Your respectful servants,
TRISTRAM LITTLE.
HENRY LITTLE.
(To be continued.)

MR. ADLUM'S VINEYARD.

My friend and myself, before the meeting of the Association this morning, rode to the Vineyard of Mr. Adlum at Georgetown, three or four miles from this city, for the purpose of obtaining a full view of slips to be forwarded to the N. York Horticultural Society, and by them disposed of as may be deemed proper. Unfortunately my horse was defeated to-day by the accidental negligence of the proprietor. We however had the pleasure of surveying Mr. Adlum's grounds, and of observing his mode of cultivating the vine. His vineyard is in a sequestered and rocky situation, surrounded by hills and woods, a few banks of Rock Creek, a small branch of the Potomack. It is planted on a steep declivity looking to the south, and covering several acres. The soil is a light loam, stony and dry, but the growth about it being chiefly white mulberry. At the lower verge, passes a small brook shaded with willows, from which a black vine-grower was very busy in plucking twigs, to be used in tying up the tendrils, instead of strings, which check the circulation and impede the growth. The vine is planted in rows, ranged above another along the slope, so as to catch all the moisture that falls, and the better to obtain the artificial irrigation. Between the rows, which are at about twice the distance of the corn, there is sufficient space for using the plough, to keep the ground light and free from weeds. The soil is also enriched by manure from barn-yard manure.

There are several distinct departments in the vineyard, set apart for the cultivation of numerous varieties of the vine. Mr. Adlum has in all about thirty or thirty different kinds, among which are the following: Hulin's Orwigsburg grape, Hulin's Madeira; Clifton's Constantia; Tokay; Earlykill Muscadell; Worthington grape; Carthagen purple Muscadine; Red juice; large fox grape; Malmsay; purple Frontinac; Royal Muscadine; black Hamburgh; black cluster; Claret; Clapiers; Miller Bergundy, and white seed water.

Mr. Adlum received us with much politeness, and treated us with a glass of two kinds of his wine of an excellent quality. It is found on the tables of the Secretaries, and other gentlemen of Washington, not less on account of its intrinsic excellence, than from a wish to encourage the growth of the vine, and the cause of domestic manufactures.

On our return home, we passed by the race track, and the field of Eclipse's fame. It is a fine scene. A few dilapidated shanties mark the

spot, where once the sports of the turf ran high; where revelry and riot resounded; and where so many contests of pith and moment have been decided. The mention of horse racing reminds me of a very curious document which I saw yesterday, in the hand writing of Mr. Randolph. It is entitled "*The Stud of Roanoke*," containing the number, name, description, and genealogy of all the horses which Mr. Randolph has at present upon his plantation.—The whole number is fifty-eight. Most of them are of the first breeds in the country. The oldest is marked 1801, making him twenty three years of age. Several of them were purchased of English noblemen—"atavis editis regibus." The list was in the hands of the Clerk, to be copied for the benefit of a southern member.—*N. Y. Statesman.*

From the American Farmer.

DEAR SIR,—Herewith I have the honor to send you a Recipe to prepare a wash for your Fruit Trees, which, when you use it, never be afraid of letting it run down in great plenty about the roots, as it is a most powerful manure, and will force the fruit on your trees; after your trees are in full bloom or leaved out, it is best not to wash the buds in it, as it is too powerful for them to stand such a shock. I beg you to accept the use of it.

I make use of many other ways to bring fruit and trees to great perfection, all found out myself. I am, Dear Sir, in haste,

Respectfully yours, &c.

J. WILLIS.

Take strong soap suds made of soft soap, put it into a tub or cask, with one head out, let it stand in the air where the rain will not fall into it, and put as much strong tobacco, or tobacco stocks, as will when well soaked, turn it of a reddish color and in a few days will turn quite offensive; then to every five or six quarts of the suds, put in one quart of strong beef brine, stir it well, and wash the trunks of your fruit trees and large limbs with it, such as apricots, plums, and peaches, &c. you will find it of great utility against frosts and insects; this is my own discovery, and I use it on some trees three times from the 15th February to the 6th April, with great success.

Having regard to the extraordinary and well known excellence of his fruit, we consider every hint from Mr. W. as a treasure to the young farmer. It is in this way that we flatter ourselves, we often give the value of the subscription in the promulgation of a single recipe—the result of many years of skillful attention and laborious care.—*Ed. Am. Farmer.*

From the New-Bedford Mercury.

LIGHT! MORE LIGHT!

MR. PRINTER,—I am persuaded from the little observation I have made, that the prejudice existing against an oil light, arises almost entirely from the ignorance of the person who trims the lamps. To produce a good light from oil, the inside of the lamps should be perfectly clean, and the vent hole at top always open and free from dirt. The oil ought to be clear of sediment. If the tube for the wick runs down into the bulb of the lamp, it will heat the oil and cause it to burn freer than it otherwise

would. In fixing the wick, care should be taken that it be only large enough to sustain itself in the tube: if it is too large, the oil will not ascend the wick quick enough to supply the flame freely. The black crust should be cut off from the wick every day, and it should not then be raised too high, as it will smoke, or spread out as I have often seen done, as that will cause it to crust very soon, and the flame will soon grow dim.

LAMP LIGHTER.

From the Revue Medicale, Juin.

New treatment of the Croup by Professor Reclamier.

This gentleman has lately informed the Academie Royale de Medicine of Paris, that he has recently succeeded in curing three cases of Croup which threatened suffocation, by means of the injection of milk and water, by the mouth and nose, at the same time, so as to excite violent convulsions of the throat and muscles of the larynx. In all the three cases, portions of false membrane were expelled. One of the children, however, died; but the death is accounted for by the presence of a dissolution of the stomach. We have no account in the Revue Medicale at what period of the disease this extraordinary mode of treatment was adopted; it must of course have been used after the complaint had existed for some time.

Patent Bedsteads.—Mr. Adams, a Cabinet Maker in Orange-street, has obtained a patent for an improved mode of constructing Bedsteads, and has for exhibition and sale some of the bedsteads of the improved construction. The improvement consists in the mode of straining the *sacking* in such manner as to dispense with the use of screws, and as to make the bedstead more firm, and the sacking much more tight, than it is possible to make it in the common mode of construction. It is also less likely to get out of repair, than those in common use, and is so simple, that it may be taken down and put up, and strained to its greatest tension, in a very few moments. We saw one of them taken entirely to pieces, put up again and perfectly strained by two persons in less than two minutes. It is easily taken down or put up by a single person.

[Boston D. Adv.]

Experimental Chemistry.—M. Fouelle the most eminent French Chemist, was not the most cautious of operators, he observed to his auditors, "Gentlemen, you see this cauldron upon this brasier; well, if I were to cease stirring a single moment an explosion would ensue, that would blow us all into the air!" The company had hardly time to reflect on this uncomfortable piece of intelligence before he did forget to stir; and his prediction was accomplished! All the windows of the laboratory were smashed to pieces, and two hundred spectators whirled away into the garden. Fortunately no serious injury was received by any one, the greatest violence of the explosion having been in the direction of the chimney. The demonstrator was quiet with the loss of his wig only.

As proofs of the mildness of the season, a bird's nest was taken by a boy at Wetherby on the 5th ult. of the hedge sparrow kind, with two eggs in it; and we understand that Mr. F. Pickersgill, carrier, of Ainderbury House, Leeminglane, has green peas in his garden, and also has a quantity of lambs. [*Leeds pa. Feb. 1824*]

NEW ENGLAND FARMER.

SATURDAY, MARCH 27, 1824.

FARMER'S CALENDAR.

BEES. When we consider the various uses to which honey and wax are applied as well in medicine as the arts, we shall be led to conclude that these insects would be highly worthy of the attention of the rural economist, even should the requisite care be accompanied with considerable labor and expense. But the cost of keeping bees is very trifling, after the beehouse and hives are made, and the care will prove merely an amusement to any one who has a mind fitted for philosophical inquiry and experiments.

It is sometimes worth the while to feed bees during the winter, and early in the spring. The quantity of provisions, the bees may have in store is to be known by the weight of the hive, and its contents. The weight of the swarm, and of the hive or box containing them should always be known, and marked; and then, after reasonable deduction, for the weight of the comb, the remainder of the whole weight must be honey and bee-bread. The swarm should weigh from four to six pounds. To ascertain their weight, that of the empty hive should be first known, and marked on it; and then the addition to that will be the weight of the bees when put into it.

If, however, the weight of the hive or box and of the swarm have not been ascertained in proper season, and there is no way to inspect the inside of the hive, the bee-keeper may perhaps form some conjecture by the apparent weight of the hive, when poised in his hands, whether the bees are deficient in provisions.

The best method of supplying bees with food, is by small canes or troughs, conveyed into their hives. "There are two seasons in which the feeding of bees become necessary, and these are in winter and spring; at these seasons, the hives should be carefully watched, and when found light, an immediate supply be given them. It is the opinion of our author, that it is best not to feed profusely, by giving a great quantity at a time, but gently, say about two pounds a month, and that the feeding should be in the morning early before the bees leave the hive, and always in pleasant weather, and that the entrance of the hive should be closed immediately after feeding to prevent robbery from other hives. Or, it may be considered most prudent and safe to administer food at evening, after sunset, when the entrance of the hive need not be closed; but the vessel containing the honey must be removed before the next morning, to prevent robbery as before. Care should be taken not to delay feeding your bees till the old store is all exhausted, for they will then become feeble and if you preserve your bees, you will lose much of their labors the next season. Sugar is sometimes administered as food for bees, as well as clear honey; Mr. Huish considers the first as improper food and often exposing the bees to the dysentery; and adds, "Wherever honey is given it should be mixed with some good old white wine; in the proportion of six pounds of honey to one of wine; it should then be placed on a slow fire, and stirred until the honey is all dissolved, then poured out into a jar or other

vessel for use, "Dissolve one pound of sugar in a quart of good old ale; boil and skim it until it is clear, when cooled it will have the consistence of honey, and may be given your bees. A little salt added to the food is both safe and useful, especially when they are threatened with dysentery. Molasses and water boiled, with little salt, may be a good substitute, together with a little treacle."—*Farmer's Assistant.*

Dr. Anderson observes in substance that during the frequent mild days of winter, and the warm mornings of spring, which are suddenly succeeded by a nipping frost, or sleety rain, bees are awakened from their torpid state, and consume their food. They are likewise often allured by unseasonable warmth to leave their hives, and are chilled before their return so as not to be able to fly. To prevent these evils he advises to place the hives in an ice house to be kept till the spring is so far advanced that the bees may be safely trusted abroad. We do not know whether this hint has ever been acted on, but it may be well to try the experiment.

EWES AND LAMBS. Deane's New England Farmer says, "if sheep are fed with a little Indian corn, about half a gill a day to each, it will keep them in good heart, prevent the wool from falling off, and enable the ewes to rear their young much better." Potatoes are better food for breeding ewes than turnips, which it is said are apt to injure the lambs. The *Farmer's Manual* tells us that the best nursing for feeble lambs is to keep the ewes well, and recommends not only potatoes and carrots but white beans in small quantities, so as not to excite fever. If your lambs are feeble they will require to be nursed with warm milk, given frequently in small quantities. Ewes milk is best, and if a ewe does not give milk enough for her lamb there is little probability that the lamb will live. Therefore as before intimated you must doctor the mother for the sake of her offspring.

If your sheep have colds and discharge mucus from the nose feed them well, and occasionally give them pine boughs or spread tar on a board, and strew a little fine salt over the tar, and the sheep will lick the tar, and get well immediately.

GOOD BEER. The season of the year has now arrived in which beer of the superlative degree will be quite a luxury, and almost one of the necessities of life. We have seen many recipes for making beer, but none which we think quite equal to the following: taking into consideration cheapness, and simplicity in making, and excellence of the beverage when produced. It was furnished by a friend, who can have no other motive in the communication than what arises from a laudable wish to benefit his fellow creatures.

A Recipe for making Beer.

Boil 10 ounces Hops in 3½ pails of water one hour, or until the leaves settle at the bottom of the kettle. Then strain it into a 20 gallon cask in which must first be put 6 quarts and one pint of good thick molasses. Fill it up with cold water. Add one pint brewer's yeast. Roll it over and shake it well. Let it remain in the cellar 24 hours with the bung out, after which it must be bunged tight, and in one week it will be fit for use. If bottled it will very much improve.

MR. ABBOT'S HARROW. The drawing and description of the newly invented harrow, which we have published, page 276 of this day's paper will, we believe be found an acquisition to the agriculturist. We have carefully perused the descriptions, and drawings of English implements of the sort, as well as compared Mr. Abbot's with those now in use in American husbandry and so far as we are able to judge, Mr. Abbot's is decidedly superior to any of them; its cheapness and the simplicity of its construction are not among the least of its merits, it is so broad and as it were fortified by the position of its timbers, that it cannot fail to be very strong and durable. It will be observed that the teeth are so placed that not any two of them move in one tract, and that the tracts are at equal distances from each other, which are desirable things in the construction of harrows. Sir John Sinclair says that "teeth of harrows should either be round, or perhaps with a sharp edge, bent forward, like so many coulters, as they make themselves cleaner than when they are square, or of any other shape, and worse after the horses." We should believe, however, if the teeth were square, and set diagonally, so that on corner of each might go forward in the line of motion that the harrow would be as easily drawn and perform as good work, in ordinary cases, as in any shape which could be given them. If the ground be rough the teeth of the harrow should be set standing a little backwards, so that they may not be so liable to catch or hang by roots, stones, &c. But when the ground is smooth, the teeth should slant a little forwards. The best way to fasten harrow teeth according to Dr. Deane is with shoulders under the harrow, and nuts screw on above. A friend, however, has suggested that a better and cheaper way is to place strong slips of timber over the beams of the harrow so as to press on the head of the teeth and confine those slips in that position by spikes, or iron pins, with screws.

Harrows of the construction abovementioned are for sale at the Agricultural Establishment, No. 20, Merchants' Row, Boston.

Fires.—On the 14th inst. an extensive Saw-mill establishment, and a Ship-house in New York, with new Steam-boat, building to ply between that city and New Haven, two brigs, and a large quantity of timber lumber, &c. including the entire timber for a new ship were destroyed by fire together with one of the City Engines, deserted in consequence of the rapid spread of the flames. A stable in Newton, N. Y. together with its contents, and three valuable horses were destroyed by fire on the 6th inst.—A large three story brick house, belonging to Jacob Ridgway, Esq. of Philadelphia, was destroyed by fire on the 12th inst.

Intoxication.—A man named Armstrong, who lives in a small cabin and alone, on Scotia Brush Creek, Ohio, was lately burnt to death, while in a state of intoxication. He had lain down by the fire, in the course of the night, which communicated to one of his hands, and entirely burnt off the flesh—burnt out his eyes, and so far burnt the skin from his head as to show the bone.—He lived but a day after this unhappy circumstance, utterly deprived of reason.

The sum of one thousand and four dollars was subscribed in the town of Newark for the benefit of the Greys.

Dr Geo. F. Klinge of the Northern Liberties, announces the death of a lad aged 14 years, from inhaling ether. It is hoped his fate will prove a warning to others. He suffered excruciating pain from Monday the 1st, to Saturday the 6th, on which day he died.

[U. S. Gazette.]

Dr. Percival, who has made himself eminent for his poetical effusions, has been appointed by the President and Senate an Assistant Surgeon in the Army to be stationed at West Point. The duties of Lecturer on Chemistry are assigned to that station.

Schuylkill Coal.—A writer in the New York Statesman recommends the Schuylkill or Susquehanna Coal as a substitute for the Liverpool Coal. He says, in substance, that two tons of the Liverpool coal are required to produce as much heat as is afforded by one ton of the Schuylkill coal; and that the latter can be ordered at about half the price of the former. Three dollars, according to this writer will go as far in purchasing fuel, if laid out in Schuylkill coal, as eight dollars applied to the purchase of Liverpool coal. We do not pretend to vouch for the accuracy of this writer's calculations, but the subject is worth the attention of the economist.

FOREIGN.

Discovery Ships.—His Majesty's discovery ships *Arctica* and *Fury* were recommissioned at Deptford, by Captains Parry and Hopper, destined for the new expedition to the Polar seas.—Captain Lyon, at the same time, commissioned his Majesty's ship *Grip*, which ship is destined for Repulse Bay, whence Captain Lyon proceeds over land to the back of that bay to survey the coast, thence to "Cape Turnagain," and then to the coast of the Gulf of St. Lawrence. Captain Franklin's recent discoveries. Captain Franklin proceeds by the way of York to Fort Enterprise.

France.—Paris papers have been received to the 22d inst., but no news of much interest is contained in them. The choice of a new Chamber of Deputies engages the attention of the people, and the Journals are filled with speculations thereon.

We learn nothing new from Greece or Turkey. The peace appears settling on her, less, and the population quiet if not contented.

CONGRESSIONAL.

SENATE.—Friday, March 12. A bill to abolish imprisonment for debt, as taken into a new draft, was introduced and made the order of the day for Monday next.

A bill "to amend the ordinance of the State of Alabama in relation to the navigable waters of the State" was discussed in Committee of the whole; and after debate was ordered to lie on the table.

Saturday, March 13. The Senate had no session on Monday.

Sunday, March 15. The bill, more effectually to provide for the National Defence, by establishing a Uniform Militia, and providing for the discipline thereof, was considered in Committee of the whole.

Mr. Chandler explained the objects of the bill; and some debate on its details, (to which Mr. Mills objected to the section providing for the training of the militia as transcending the power vested by the Constitution in Congress) it was laid on the table.

Tuesday, March 16. The bill to abolish imprisonment for debt was again considered, and debated at considerable length, but no decision obtained.

Wednesday, March 17. A bill further regulating the jurisdiction of the Supreme Court was reported and read twice.

The bill to abolish imprisonment for debt was resumed, further discussed, and made the order of the day for Friday next.

Thursday, March 18. A bill to enable the President to carry into effect the Treaty of Ghent excluding foreigners from trade and intercourse with Indian tribes, to preserve the fur trade within the limits of the United States, to American citizens was reported and read to a second reading.

Friday, Saturday, March 13. The Appropriation bill, as reported by the Committee of the whole, with amendments was considered. Many of the amendments were agreed to; but one to appropriate \$26,000 for completing the North Portico of the President's House was disagreed to—Ayes 66. Noes 114. An appropriation of \$5,000 for completing the walks in front of the public property was agreed to—Ayes 94. Noes 4.

Also an appropriation of \$16,000 for carrying into effect the 1st and 7th articles of the Treaty of Ghent.

Sunday, March 15. The House, in Committee of the Whole, resumed the consideration of the Tariff. Mr. Baines, of Mass. moved to amend the bill by increasing the minimum cost of Leghorn hats, &c. to five dollars each, and to be charged with duty accordingly. In support of this motion he gave a succinct history of this branch of manufacture in this

country, from its earliest origin, till it had grown to the annual amount of a million and a half of dollars; and stated the manner in which it had been ruined by importation of Leghorn bonnets, to the amount last year of \$300,000. The motion was opposed by Messrs. Cambreleng, Sharpe, Marvin and Floyd, and lost.

Tuesday, March 16. A Message was received from the President, informing the House that he had caused the necessary inquiry to be made respecting the execution of the resolution of Congress, of 1777, directing a monument to be erected to the memory of Brig. Gen. DAVID WOOSTER, and finds by the report of the Register of the Treasury that no monument has been erected to the Memory of that patriotic and gallant officer, nor has any money been paid to the Executive of Connecticut on that account. Referred to the Committee of Ways and Means.

Wednesday, March 17. On motion of Mr. Newton, 2000 additional copies of the communication from the Treasury containing a digest of the Commerce of the United States were ordered to be printed.

Thursday, March 18. The House took up the report of the Committee that Mr. Bailey is not entitled to a seat, &c. which after debate was decided against Mr. Bailey's admission. This question was decided against Mr. Bailey on the ground that he was not an inhabitant of Norfolk, Mass. but was an inhabitant of Washington at the time of his election.

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has just received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seeds, which added to his former collection makes the greatest assortment in New England—among them are 50 bushels early and Late Peas, of various sorts; 150 lbs. Turnip, 100 lbs. RUTA BAGA, 200 lbs. Carrot, 100 lbs. Beet, 100 lbs. MANGEL WURTZEL, 50 lbs. Cabbages of sorts, Cauliflowers, 100 lbs. Radish of sorts, Lettuce of sorts, Endive, Kail, Celery, SALSAPILLA, SCORZENERA, Onion, Leek, Sweet Marjoram, Thyme, Sage, summer and winter Savory, Lavender, sweet Basil, Chervil, Fennel, Burnet, Grass Seeds, viz:—Herds, red and white Clover, Fowl Meadow, Red Top—with a large collection of ORNAMENTAL SEEDS.

Garden Tools, viz:—Pruning and Budding Knives, Pruning Saws, Pruning Shears, Garden Reels and Lices, transplanting Trowels, Rakes, Dutch or Pushing Hoes, Edging Irons.

Gooseberry and Currant Bushes, Honeysuckles, Garden Roses, &c. 1200 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety, constantly for sale, such as Roses, Myrtles, Geraniums, Agapanthus, Orange Trees in fruit and blossom, Rosa Multiflora or Garland Rose, Mountain Daisies, Lantanas, &c. 50,000 THORNS or QUICKS for live fences.

ENGLISH CHEESE, and fine **ENGLISH SPLIT PEAS**. March 27.

NEW GHRDEN SEEDS.

JUST received by the London Packet, and for sale by GEO. MURDOCK, No. 14, Market-square, an assortment of GARDEN SEED, of the last year's growth, among which are, Early and Late Cauliflower, Early and Late Cabbage, Early and Late Peas, Sweet Marjoram and Thyme, ARMACK, MANGEL WURTZEL, RUTA BAGA, &c. *Likewise*—a few cases of MARASCHINO and CURACOA, a Cordial much celebrated in Europe—French Anisette in baskets of 2 bottles each—Welch's No. 1 Chocolate, Cocoa and Shells—green Madeira Citron, with other Groceries as usual.

Likewise—a few Hampers of Rich Cheshire and Loaf Cheese—London Brown Stout, in whole and half Bottles—English and French Mustard, in kegs and jugs. March 27. 6w

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

March 27. LINCOLN FEARING & CO.

FRUIT & ORNAMENTAL TREES

FOR sale, as usual, at the **KENRICK PLACE**, near Brighton. The nurseries have been much enlarged, and contain a variety of Pears, Apples, Cherries, Plums, Apricots, &c.—Also, the finest Nursery of budded Peach-Trees known in America; consisting of a choice collection of about 30 of the most approved kinds in our best gardens, or seen in the markets. The trees are from 5 to 6 feet high, and sold at the Nursery at the moderate price of 3/1-3 cents each.

Of good sized ornamental trees, the Flowering Horse-Chestnut; Flowering Catalpa; European Mountain-Ash; Weeping Willow; the evergreen Silver Fir, and the Larch. English Walnuts and Butternuts, both of which are justly admired for their fruit. The latter is a hardy, handsome tree, and its bark valuable in dyes and medicine.

Currant bushes of the large prolific red kind, of all sizes, by the dozen, hundred, or thousand, on moderate terms: Also the Black, White, and Champaigne do. Red and White Roses; Lilacs; English Grapes; Gooseberries, &c. &c.

Orders addressed to *John, or William Kenrick*, and sent to the Brighton Post-Office, or the Office of Mr. Samuel Dana, Broker, in State-street, Boston, will be duly attended to.

N. B. Trees will be packed in clay and mats, for shipping, and conveyed to Boston when ordered; but gentlemen at a distance should employ some agent to receive and pay for them. March 27.

BY T. G. FESSENDEN.

"A man that flattereth his neighbour spreadeth a net for his feet."

'Tis better to listen while enemies rail,

Take warning from scoffers, with malice replete,

Than lend a pleaser's ear to the Flatterer's tale,

Who is artfully spreading a net for your feet.

The lips of the Flatterer not only bring

To ruin the simple and credulous maid,

But men of all stations from pauper to king

The parasite's prattle has often betray'd.

The vilest of vicious and villainous men

Will play you the friend or the lover in style,

And be most excessively complainant when

Intending like Joab to stab with a smile.

But he who your foibles and faults will disclose,

With mildness of manner, and motive sincere,

Is the friend, whom you ought to hold nearer than those

Whom ties of fraternity serve to endear.*

We often a monitor find in a foe,

Impell'd to abuse by malignity's thrall,

Whose coarsest revilings a favor bestow,

As virtue is found in rattlesnake's gall.

Let reptiles of malice go on to backbite,

And envy's heart burnings burst forth in a blaze;

A man becomes cautious as well as upright

Who knows that such censors are watching his ways.

Then listen and learn while your enemies rail,

Be warned by the scoffer with malice replete,

But turn a deaf ear to the Flatterer's tale,

Who is artfully spreading a net for your feet.

* There is a friend that sticketh closer than a brother.
PROVERBS.

MISCELLANY.

BRIEF HINTS TO PARENTS.

Industry and Economy.—Idleness is an inlet to most other vices; while, by industry, the powers of the mind are turned to good account.—Usefulness of character depends much on diligence. Early to accustom children to industry, application and perseverance, is a necessary part of education. If indulged in idleness when young, application to business will afterwards be irksome. They should early be made sensible of the value of time; they should be made to understand that no economy is so essential as the economy of time; and that as by squandering pence, we are very soon deprived of pounds; so, by wasting minutes, we shall lose not only hours, but days and months. We must endeavour to inspire children with the spirit inculcated in the following precept: "Whatever thy hand findeth to do, do it with thy might."

For a young woman to have been properly instructed in the management of the family, is far more essential to her than all the elegant arts on which so much time and expense are by some bestowed. If she has been made acquainted with every particular circumstance of a servant's duty, takes an active part in family concerns, combines frugality with plenty, retrenches superfluous cost and decoration, and thus is fitted to meet adverse as well as prosperous circumstances, she will be useful and respectable in her father's family, and particularly so in a married state. When domestic economy is

viewed in this light, is there a woman that would disdain to rank it among her accomplishments? Or a sensible man who would not prize it in his wife?

Whatever may be our occupation in life, there is an industrious, upright, liberal and benevolent mind, an inherent dignity, that will meet with esteem from all whose opinion deserves to be regarded.

And as frugality and industry are by no means necessarily connected with an avaricious disposition, the most opulent parent ought not to be ashamed to adopt, in the economical education of his children, the excellent motto, "waste not, want not." Early habits of care, and an early aversion and contempt of waste, are interesting lessons for children to learn. The most industrious and frugal are frequently the most liberal and benevolent. And it is upon this principle, that children should be taught not only to save, but that they are responsible for making a right use of what they save, or possess.

While encouraging children in industrious habits, let us not forget or neglect to encourage industry at their books, and to afford them opportunities of mental improvement, to qualify them rightly to enjoy the necessary intercourse with mankind.

LONGEVITY IN LINCOLNSHIRE.

When the famous Turketul, who had been Chancellor of England, and one of the greatest warriors and statesmen of his time, retired from the world, and became Abbot of Croyland, he found five very aged monks in a monastery, to whom he paid particular attention. Father Clarendon, the oldest of these monks, died A. D. 973, after he had completed the 168th year of his age. The second, who was named Swarling, died the same year, at the age of 142. The third, who was called Father Turgar, died the year after, in the 115th year of his age. The two other monks, Brune and Aso, died about the same time, whose ages are not exactly known, though they must have been very old, as they both remembered the old Abbey of Croyland, which had been destroyed by the Danes, in the year 870. These facts are related with much confidence by Ingulphus, who was Abbot of Croyland, and wrote from the historical Register of that Abbey. When we recollect also, the very recent instance of longevity in Elizabeth Shaw's case, who died at Keel Cotes aged 117, we think the Lincolnshire fens, are not so unhealthy as generally reported. [*Bell's Wky. Mes.*]

Anecdote of General Lincoln.—At Puryburg, on the Savannah river, a soldier named Ficklin, having made frequent attempts to desert, was tried and sentenced to be hanged. General Lincoln ordered the execution. The rope broke; a second was procured, which broke also; the case was reported to the General for directions. "Let him run," said the General, "I thought he looked like a scape gallow."

A writer in a New-York paper, speaking of the insufficient manner in which the street lamps were lighted, says, "Five-and-twenty full grown lightning-bugs would have stared them all out of countenance."

When we see a wretched people with depressed minds and indolent habits, we do not as-

cribe their poverty to those who govern the but no one, that sees a mangy, half-starved flock of sheep ever doubts that it is the fault of the farmer, to whom it belongs.

BELLFOUNDER,

The Wonderful Norfolk Trotter, imported July 18 from England,

WILL STAND THIS SEASON, 1824.

At Twenty Dollars, and One Dollar the Groom. 7 money to be paid to the Groom at Coving.

THIS celebrated Horse is a bright bay, with black legs, standing 15 hands high; his superior blo symmetry and action excel those of every other trot Stallion. He is allowed by the best judges in Norfolk to be the fastest and best bred Horse ever sent out that County. He has proved himself a sure foot and his Stock for size and substance are not to be passed; they are selling at the highest prices of Horses in Norfolk.

BELLFOUNDER was got by that well known, and highfomed Trotter, OLD BELLFOUNDER, out Velocity, which trotted on the Norwich road, in 18 Sixteen miles in one hour, and though she broke five times into a gallop, and as often turned round, won the match. In 1808 she trotted Twenty-eight miles in one hour and forty seven minutes, and has also done many other great performances against time.

BELLFOUNDER, at five years old, trotted 2 miles in six minutes, and in the following year matched for 200 guineas, to trot Nine miles in the minutes, and he won easily by thirty-two seconds, and owner shortly after challenged to perform with him a centennials and a half in one hour, but it was not completed. He has since never been saddled or matched.

OLD BELLFOUNDER was a true descendant from original blood of the Firewings, which breed of Horses stand unrivalled, either in this or any other nation.

BELLFOUNDER is strongly recommended to public by the subscriber, as combining more use properties than any other Horse in America, and stand, during the season, at his stable in Charlestown where all inquiries, post paid, will be attended to.

SAMUEL JAKUES, Jr.
Charlestown, Mass. March 20, 1824.

VALUABLE STOCK FOR SALE BY THE SUBSCRIBER.

A VERY superior MALTESE JACK ASS, 7 years old, 14 hands high, remarkably well made, and quiet in his temper, that a child can manage him, was obtained of the Governor of Malta and imported Capt. Robert B. Edes.

Also two BULLS 22 months old out of good native cows, they are well formed and girt six feet each. Price \$100 each.

Also one BULL 23 months old, out of the famous, derby cow, imported by John Hubbard, Esq. Price \$125.

Also the Bull YANKEE, 34 months old out of a very fine native cow owned by Mr. Francis Amory. Yank received a premium at Brighton Show in October last. Price \$150.

The above Bulls are in fine condition and were sired by the noted Improved Durham Short Horn Bull, Cribbs.

If the Bulls are not sold by the 20th of April they will be let on shares.

SAMUEL JAKUES, Jr.
Charlestown, Mass. March 13, 1824.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of Mang Wurtzel Seed, raised by John Kenrick, Esq., New York, Feb. 21.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but the who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

FOR THE NEW ENGLAND FARMER.

MARLE.

Consists of calcareous matter, clay and sand, some two of these earths, (of which lime or alkali is always one) in various proportions. The blue clay marle is free from sand. Clay marle is also sometimes of a yellowish white, flowish grey, or a brown or red cast. The all marle seldom contains clay. In schistus or one marle, sometimes sand and sometimes clay, preponderates, generally the former. The sand marle, whether shell or schistus, should be applied to clays; and clay marles to sands. In both cases they correct the defects of the soil; by rendering it, in the first, less adhesive;—and, the latter, less open and porous.

The earths are not the food of plants. They constitute the stomach, analogous to the stomach of animals, in which vegetable and animal matter is received, digested, and, with the aid of the leaves [lungs] assimilated to vegetable chyle and blood. The best soil for this digestive process is that in which the three above named earths are suitably blended.

A sandy or gravel soil is called hungry, because it digests rapidly, and dissipates the matter committed to its bosom. Hence green crops, or frequent manurings, are necessary to continue it healthy and productive. Such soils are defective in clay and calcareous matter. Their texture may therefore be improved, and their fertility increased, by the application of clay marle; or, what is the same, by clay and lime separately; though these materials are not most pure, and best blended in the substance of marle. The quantity should be proportioned to the natural deficiency of these materials in the soil. From eight to one hundred loads per acre have been applied, in one or two seasons; and their beneficial effects have been known to continue thirty years. All the sand hills of Norfolk, England, have been marled (layered). Calcareous matter, combined with sulphuric acid [oil of vitriol] is usefully applied to soils in the form of gypsum, or plaster of Paris; as is also powdered lime-stone and chalk, with calcareous. I am induced to believe that either wheat nor sainfoin grass will thrive in soil destitute of calcareous matter, which is a condition with most of our sands.

A stiff moist clay is called cold, and is unyielding to the finer grasses, as well as grains. Its texture is too compact to permit the roots to extend freely, and its temperature too cold, to hurry on the digestive process sufficiently rapidly the plants which grow upon its surface. Sand and lime, or silicious marle, loosen its texture, render it permeable to heat, &c. and powerfully assist to concoct the food of vegetables.

Marle may be known by the most ordinary experiment. The application of a mineral acid, and even of good vinegar, will cause an effervescence. This is the operation of the acid upon the lime, its silicious and argillaceous properties may be ascertained by the sight and feeling, by the aid of water, or of glass. Sand subsides or settles

quicker than clay in a liquid; and will scratch glass, which clay will not.

It is a remarkable fact in the economy of nature, that the indigenous plants of every country, are precisely those which are best adapted to furnish the proper sustenance to its animal population, and to satisfy its medicinal wants. So in regard to our soils,—every district generally affords the means of producing fertility. Hence the clay marles generally underlay sands; and shell and sand marles most abound in the neighborhood of clays. And in addition to the variety of fossil substances which are calculated to increase fertility, every thing that grows upon the earth, every particle of animal and vegetable matter, is reduced to air and water, by the chemical operations of nature, and these forms become the food of new plants, to nourish animals. It is a truth calculated to teach humility, that the animal, the vegetable, and the putrid mass of dung, are found on chemical analysis, to be very nearly alike, and that in the natural order of things, they constantly nourish, feed, and produce each other. "Nothing is nourishment for a vegetable but what enters into the permanent composition of a vegetable. Nothing is nourishment for an animal but what was originally a vegetable." Man is enjoined to earn his bread by the sweat of his brow. He finds the most noble incitements to duty scattered around him, and he is seldom disappointed in obtaining the rewards, competence and health, which industry promises to her votaries. But I have another remark to make as to the food of vegetables. How scrupulously careful is the farmer of his grain, hay and roots, which are destined to nourish and fatten his animals; and yet how thoughtless and inattentive as to the food of his plants! Vegetable and animal substances are suffered to waste in his fields and yards, unmindful of the havoc which the rains, winds and sun are daily making upon them; while a moiety of his fertilizing materials, the urine of his stock is altogether lost. He will not suffer the flocks of his neighbors to rob his own of their food; yet he sees with but feeble efforts to prevent it, his plants plundered by pestiferous weeds, of the food which is essential to their health and vigor.

PEACH TREES.

I beg leave to add, to the prescriptions which you published in a late Farmer,* for destroying the worms at the roots of peach trees, the two following. The *modus operandi* of both will be readily understood.

1. Hot water, turned from the nose of a tea kettle, upon the trunk, a little above the ground will destroy them without injuring the tree. It may be done in June and October. I think this has been recommended by Judge Peters.

2. Put a peck of old slacked, or effete lime about each tree in August.†

* Vol. ii. pages 241, 242.

† NOTES BY THE EDITOR. THE HON. JOHN LOWELL has recommended the same remedy against the Canker-Worm. Mr. Lowell says "I had understood that Mr. Josiah Knapp, of Boston, was induced to try the effect of air-slacked lime. He put it round one of his

I am surprised that neither correspondent nor editor, in the article alluded to, have enjoined the propriety of cultivating *only* the good, that is, the early peaches: for in our northern latitude the name is nearly synonymous. We seldom have heat enough in the latter part of September and October to mature this fruit should it escape frost, however fine the variety may be in a warmer climate. One tree of an early kind, is worth a hundred of late ones. This fruit is very much like Jeremiah's figs.

I think the peach worm is not the apple worm, nor do I think it a borer. The first never penetrates the wood but burrows and feeds on the inner bark of the trunk and roots. The borer penetrates and lives upon the wood. I have found it in the apple, quince, plum, sugar maple, horse chestnut, and particularly in the locust [robinia] but always in the wood, when in a full grown state.* When the leaf bud of

trees in the spring of 1814, and I have been assured, not only by him, but by another respectable friend who examined it, that it was fully successful. The tree was in a small garden in Boston, surrounded with other trees, which were filled with the worms, and this one wholly escaped, except that a few appeared to have attacked its extremities, where they were interlocked with other trees. I mentioned this fact to a Rhode Island gentleman, who informed me that, in that State, they used to collect the rubbish collected from the breaking of flax, and it had effectually prevented the rise of the insect. I resolved to make the experiment on mine on an extensive scale. As the insects rise in the fall, I determined to put the lime on in autumn. For this purpose I had the turf dug in around sixty apple-trees, and the earth laid smooth. I then took three hog-heads of effete or air-slacked lime, and strewed it an inch thick round my trees, to the extent of about two or three feet from the roots, so that the whole diameter of the opening was from four to six feet. I tarred these trees as well as the others, and although I had worms or grubs on most that were not limed, I did not catch a single grub on those that were limed. I do not speak with confidence; I am, however, strongly encouraged to believe the remedy perfect."—*Massachusetts Agricultural Repository*. See likewise *Thacher's Orchardist*, page 92.

It is a fortunate circumstance that, although the insects which prey not only on our fruit trees, but so often blast the hopes of the farmer in every department of husbandry differ so much in their varieties—their genera, species, &c. &c. that the most scientific entomologist can scarcely describe them, nor trace nor identify them through their different forms and modes of existence, yet the same or similar remedies will destroy any or all of them. Lime, root, wood ashes, tobacco juice, leaves, or decoction of elder, soap suds, salt, salt petre, &c. are all antidotes against all kinds of insects which infest every kind of vegetation. A knowledge of the different kinds of those devourers, their habits and metamorphoses is useful by teaching us how, and when to apply our specifics. Some insects are best assailed in the egg, or in the larva, worm, or caterpillar, some in the pupa, or chrysalis, and some in the perfect insect. But, generally speaking, we believe any of the above applications will prove fatal to any of the tribes in any stage of their existence. The difficulty consists in coming at the enemy; and to obviate that a knowledge of entomology is useful and in many cases indispensable.

* The insect, however, which it is thought to have proved most fatal to the locust tree, in New England, we believe, is not the same with the borer, which destroys apple trees, and is described by Mr. Prince, as a small, white, ringed worm, about three quarters of an inch long, with a dark colored head." The locust-tree

the locust is bursting, it may be found of diminutive size in the bark, and I have picked out hundreds with a knife. But fourteen days after I have had to search for them in the wood, where it is difficult to destroy them, even with a flexible wire probe, as their course is rapid, and seldom but a few inches in one direction. I am not entomologist enough to know, whether these are all of one species. The warts or excrescences on the plum-tree, are caused by an insect different from either of the above, a description of which you will find in the Agricultural Repository.* That disease of the plum-tree is occa-

insed, according to a writer in the Mass. Ag. Rep. Vol. v. No. 1, page 67, are true Caterpillars. "The general color of the larva is red," approaching that of the cherry, paler towards the sides," &c. The locust tree may, however, be infested with a "borer" of the same species with that which Mr. Prince and others have found in apple trees, &c. in addition to the Caterpillar or Cossus Robinia, the technical name of the locust tree insect, which is the principal destroyer of that tree.

* Our correspondent has not directed to the particular part of the Agricultural Repository, which gives a description of this insect. Perhaps he may have alluded to an article, bearing the signature of the late Professor Peck, published in volume v. page 307, from which the following is extracted.

"The plum-trees, *prunus domestica*, have for a number of years been disfigured with irregular swellings on the younger branches. The seat of this disease is in the bark. The sap is diverted from its regular course, and is absorbed entirely by the bark which is very much increased in thickness, the cuticle bursts, the swelling becomes irregular, and is formed into black tumors, with a cracked, uneven, granulated surface.—The wood, besides being deprived of its nutriment, is very much compressed, and the branch above the tumor perishes. The cherry tree is affected in a similar manner.

"When the Board of Trustees met at the seat of John Lowell, Esq. in Roxbury, on the 27th of June last, Mr. Pomeroy took from a cherry-tree in Mr. Lowell's garden, a small branch diseased as above mentioned of the plum tree. On taking off a thin slice of the tumor, I found it was inhabited by living larvae; and flattered myself that the disease of both trees arose from the same insect. I brought the branch home with me, and placed it in a large glass phial. On the 6th of July I perceived that the larva had left the tumor, and were uneasy in the bottom of the phial. A vessel of earth was immediately prepared, as mentioned above in the account of the pruner; the larvae when turned into it buried themselves instantly. On the 30th of the same month, or twenty-four days from their leaving the bark, the perfect insects began to rise. They proved to be insects which I had long known to occasion the fall of peaches, apricots, and plums, by the larva eating into the kernel of those fruits long before they had acquired half their growth.

"This insect belongs to the same genus with the rhynchenus strobil or white pine weevil, described in the Massachusetts Agricultural Journal for January 1817, to a plate in which I would refer for a representation of the parts of the mouth. In that, the rostrum or snout is nearly straight; in the present species it is curved, so as to form the segment of a circle. All the thighs have two small obtuse points on the under side. In color it is variegated with white and red hairs; the ground color of the shelly coat on which they are placed is dark brown. The thorax is contracted behind the head; its surface is irregular, much pitted, and has a raised longitudinal line in the middle, with three small tubercles on each side of it, placed in a triangular form. The elytra were marked with longitudinal ridges, and on these are placed oblong tubercles, of which there are ten or twelve; four of these in the middle of the elytra are largest, smooth, and of a brown black color. On the under side the body is pitted, or marked, with large impressed points, like the top of a thimble. The first pair of feet is rather the largest; the second the smallest, and all sprinkled

sioned by a puncture in the tender branch, thro' which a nit is deposited. The effect is similar to that produced on some species of the oak, by a similar insect, and to which we are indebted for nut-galls. Some of our dwarf oaks produce balls, enveloping the maggot, of appearance similar to the nut-gall. It has been said, and my experience seems to verify its truth, that a large sod of grass, placed downwards, in the crotch of the tree, will prevent this malady, by interposing an obstacle to the ascent of the insect, which it is inferred is unable to fly.

The peach with me is a precarious bearer, in consequence of the frequent destruction of the blossom buds, by frost in winter or spring, before the petals unfold, but when the buds are swelled, by the propulsion of the sap to the extremities, which is often the case in winter. It has been said, that by retarding the flow of the sap, until after the season of severe frosts, fruitfulness is ensured. In confirmation of this fact, I can state, that in travelling sixty miles upon the banks of the Hudson in April last, I found the blossoms of the peach destroyed in all the warm soils and sheltered situations; and uninjured in only three situations, all of which were elevated and bleak, and two of them upon clay soils. Admitting the position to be correct, that we can ensure a crop, by retarding the circulation of the sap till near the first of May, how can this circulation be kept back? Can it be done by keeping the ground frozen about the roots? This may be done by covering the earth about the trunk with straw or manure, after the earth is hard frozen, or by planting the trees on the north side of a close fence or wall. We know that nature, in her economy lays up in the branches and buds of deciduous trees, in the autumn, a stock of food, sufficient to unfold the embryo leaves and blossoms of spring. Can the young progeny of buds derive nourishment and growth from this food, without the consent and aid of the trunk and roots? And can the latter afford aid while bound in a torpid state by the frost? A solution of these questions might very much aid our endeavors to obtain this valuable fruit with some degree of certainty.

Albany, March 10, 1821.

with white and bright rust-colored hairs. The points of the claws on all the feet are double. Figure 5, shows the natural size of the insect, and figure 6 magnified.

"Mr. Pomeroy was so obliging as to bring me three tumours cut from his plum-trees, later in the season, but the larva had left them. Being, therefore, uncertain whether the disease of the plum-tree is to be attributed to this insect or to another species of the same genus, I would call it the cherry weevil. It may be distinguished by the specific name of *rhynchenus (cerasi) femoribus dentatis; fulvo albique variegatus, elytris tuberculis pluribus carinatis, quatuor in medio majoribus nigris*."

In the Massachusetts Agricultural Repository, vol. v. p. 191, is an article, communicated by Justin Ely, Esq. in which Mr. Ely asserts that "Mr. Yates, a respectable farmer of Petersham, in Worcester county, informed me, that the insects which cause black bunches on plum trees, are prevented by digging around the roots in the spring, and putting in half a bushel of ashes and covering them with earth."

FOR THE NEW ENGLAND FARMER

FRUIT TREES.

The season for setting out fruit trees is near, and it highly becomes every one who possesses so much as half an acre of ground, immediate-

ly to attend to this business, if he has heretofore neglected it.

Almost every man who owns any land, may with suitable exertion and care, raise a sufficient quantity of various kinds of good fruit for his own use.

An apple tree taken from the nursery and set in rich ground and properly managed, will frequently bear plentifully in eight or ten years.

The pear tree is as easily cultivated as the apple tree, and will produce fruit in about the same time.

The peach tree will bear in four or five years from the stone, and has been known to bear the third year. But notwithstanding good fruit may be so easily raised it is lamentably true that a large proportion of the people are destitute of it, merely for the want of a little attention and care. It is remarkable that these folks are generally very fond of good fruit and always eager to obtain it if it can be had at the expense of the toil and labor of others.

Such people are the worst kind of beggars and ought to be frowned upon and sent away empty by their more wise and industrious neighbors,—for why should one be dependent on another, year after year, for those luxuries which are as easily to be raised by himself as by his neighbor.

To the Editor of the New England Farmer,

SIR,—I wish that you or some of your correspondents would give some information through your paper relative to preparing lime to be used as a manure for wheat—whether it is to be taken from the cask and pounded fine and sown unslacked, or whether it is to be slacked with water and then sown, and how much slacked or unslacked would be necessary to be sown on an acre.

BY THE EDITOR. In conformity to the request of our correspondent we will give some directions relative to the use of lime, as manure, mostly taken from writers of established reputation. We should be happy to receive communications from others who have derived knowledge on this subject from experience.

Sir John Sinclair says, "In general it may be observed, that strong loams and stubborn clays require a full dose of lime to bring them into action, as such soils are capable of absorbing a great quantity of calcareous matter. Lighter soils require less lime to stimulate them; and may be injured, by administering a quantity of lime, recently calcined, that would prove moderately beneficial to those of a heavy nature."

The author of Letters of Agricola says, "As an exuberant dose of lime is pernicious, so any quantity great or small, is useless on poor and exhausted land. Dung in this case would be beneficial; but calcareous earth is hurtful and ineffective."

Mr. Evelyn advised to the mixing lime with turf in alternate layers, to lie in heaps for months; in which time it will become so rich and mellow as to run like ashes. He thought it would nourish the soil more than if used alone, in a greater quantity, and without any danger of exhausting the vegetative virtue of the earth, which should be preserved. If it were mixed with a large proportion of clay, or with mud from the bottom of ponds or rivers, it might be applied even to sandy and gravelly soils without danger and to great advantage."

A truly practical husbandman of great experience gives directions for the application of lime, which merit attention. Let the whole quantity of lime, intended to be used on any given field of moderate size, be

* Code of Agriculture, p. 206.

† Letters of Agricola, p. 277.

‡ Drane's New England Farmer, p. 143. Wells & Lilly's edition.

into one heap where water can be had most conveniently. Let it be there thoroughly slackened; and immediately after it is cold, which will be in a day or two, fill the carts, and spread the lime out of them in shovels over the surface. The more common mode of laying it down in small heaps over the whole field, to slack by rain is very erroneous, it is liable to too much rain, which in place of reducing it to a powder, converts it into a running mortar, in which it will neither spread equally nor mix with the soil. And Mr. Wright remarks, for the same reason both the soil and the lime should be quite dry at the time of sowing."

But, if quick lime is laid in small or large heaps and sowed immediately with mould, and suffered to slack, become mild in that situation we believe every object as regards its preparation will be accomplished. If it is wished to use it immediately, water may be poured on the heaps after they are covered with the soil. Lime should not be ploughed in unless with a very shallow furrow, but kept as near the surface as possible. Its effects are not always visible, even when it acts most beneficially the first year. It must be perfectly mild before it can be of any use as manure or enter into the composition of wheat or other plants, in which it is found in analysis. It is therefore well to sow it on grass land a year or two before breaking it up; for if ploughed too soon it falls to the bottom of the furrow. It should have time to become not only slackened, but incorporated with the soil before it is ploughed under.

There is waste in applying quick lime to new dung, or to any other substance which is combustible, and which it is not wished should be consumed. But when it is applied in small quantities to any animal or vegetable substances, capable of being consumed by its osseous burning quality, the loss is very trifling, and there is any earth, or other absorbent substance in the heap, the gas, vapor or smoke, which is evolved while the mass is heating will communicate most of its qualities to the absorbent substance, which may be used as manure.

Lime may be applied at any time of the year from March to November, but never while quick, or caustic to growing plants. If used as manure for spring wheat, it can be slackened and sowed immediately after the wheat is sown in with the seed. This appears to have been the mode in which it was applied by Col. Valence, in obtaining his premium crop of wheat, and the quality used by him was one hoghead to an acre."

See *N. E. Farmer*, vol. ii. pages 170, 186.

CANDLE-BERRY MYRTLE.

To the Editor,

SIR,—It is proper you should call the attention of the public, the Society of Arts, and Board of Agriculture, to a vegetable production, which promises great social benefits, and towards which the speculations of merchants, the ingenuity of manufacturers, and the fostering patronage of the public, ought to be invited.

The triumph of man over nature, by prolonging his enjoyments, and active pursuits, after the setting of the sun, when all other animals retire to sleep, is a splendid proof of his original power of combination. To complete this triumph ought, by continued exertions, to increase the means of creating artificial light, and exhibit the stores of chemistry and natural history till he has united all the points of perfection in production and economy.

What can be more gross and offensive than the oil which, to this day, we burn in our lamps, or the tallow which emits its fetid smell from the candles? What can be more clumsy and worse than those contrivances, as we commonly meet with them! What more primitive—more barbaric—or more unscientific!

In this view I was exceedingly gratified by the experiments of WILSON, and I am yet at a loss to comprehend how his excellent system miscarried, after the beautiful demonstration which he

afforded the public in Pall Mall. He may have calculated, with the over sanguine feelings of genius, on the commercial advantages of his plans, and may consequently have disappointed some of the speculators that flocked about him; but in this intellectual age and country, such a design ought to be supported by the spirit of philosophy and patriotism, and not to depend on selfish views for its introduction. It was a design worthy of the support of a whole people—worthy of the countenance of government—and worthy also of one of those countless millions voted away every year by Parliament, to effect some purposes which a future age may better value, but of the benefits of which, the present age is completely in the dark!

If, when the process and combustion were imperfect, a certain degree of smoke sometimes escaped from the tubes of the gas lights, as it does from tallow candles, this was a subject for the study of our great chemists, who would, in my opinion, at least, have been in this way quite as usefully employed as in chemical conjuring, in producing metals which nobody values; at the same time, too, that those gentlemen knew full well, that no other metal is wanted in England but gold!

My attention has been excited to this subject by a visit lately paid me by a patriotic native of Nova Scotia, who, having never been in England, described himself as much annoyed by the smell and smoke emitted from our tallow candles. On inquiry, I found that in his family and province, he and his neighbors burn only wax. Yes, wax!—startle not reader,—in a beggarly province of Nova Scotia, the farmers and laborers burn none but wax candles! He informed me that in the uncultured woods there grow abundance of the *Myrica Cerifera*, wax-bearing myrica, or, vulgarly, the candle-berry myrtle. With these wax-berries, he says, they make excellent wax candles, fragrant instead of noisome, in their odour, economical in their consumption, and clean and agreeable in their use. He admitted, however, that the manufacture is not perfected, that the wax, which is of a green color, would be improved by being bleached and that some common processes of purification would greatly improve it. He says, that this myrtle delights in moist situations, that it would thrive well in England, and that every country might grow, on sites now useless, wax enough for all the candles which it consumes!

Is not this then an object worthy of the Society of Arts and Board of Agriculture? Is there any pursuit in which, by possibility, they can be more advantageously engaged? It is certainly worth as much attention as an improvement in a pair of snuffers, or as plans for raising rents by consolidating farms!

The Monthly Magazine at least will, I hope, bestow some attention upon it: will encourage communications from Nova Scotia, and other parts of America, where this tree flourishes: will record experiments made upon it in England; and give these wax candles a fair chance of naturalization in the native country of arts, sciences, and improvements! COMMON SENSE.

P. S. The writer is perfectly aware, that *Myrica Gale* grows in great abundance in North Britain, and has been occasionally applied to the purpose of candle making; he has heard also of experiments in Devonshire of the same nature; but these facts serve only to support

his hypothesis in favor of the general introduction of this vegetable wax. A gentleman who has made them in Devonshire assures him their fragrance is delightful, their light brilliant, and their economy great.—*Monthly Magazine*.

HORTICULTURE.

We have received and perused with much pleasure the prospectus of the New-York State Horticultural Society. The source whence this project is understood to proceed entitles it to great respect, emanating from a scientific and distinguished botanist. The primary object of the proposed association is to establish a garden of ten or twenty acres, in the vicinity of this city, for the express purpose of horticultural and botanical improvement. There are to be collected and seen at one view all the indigenous plants of our country, and such exotics as are remarkable for beauty or utility. Another object of the society is the propagation of fruit trees, all the varieties of which are to be cultivated, and seeds, cuttings, and buds, gratuitously distributed to nursery-men, with information as to their character and culture. A third object is an improvement in our markets by an increased attention to the production of esculent vegetables of the best kinds. One distinct department of the garden would be appropriated to flowers, thus combining pleasure with utility; and appended to the establishment would be rooms for botanical lectures. Students attending the Medical College would find such a garden, where they might practically indulge in the pursuits of natural science, a pleasant and profitable resort. It is likewise a part of the plan to establish auxiliary societies, or branches in other parts of the state, wherever a taste for such pursuits exists.

All these objects appear to us rational, practicable, and in the highest degree commendable. Horticulture has been too long neglected, and it is time for New-York, foremost in wealth, in improvements, and in useful institutions of all descriptions, to take up this subject in good earnest. With some few modifications of the plan, we could wish to see it carried into immediate execution. It is well known that a Horticultural Society already exists in this city, consisting chiefly of practical men, who have long been engaged and have much experience in their professional pursuits. At the last session of the legislature, they obtained an act of incorporation, authorising them to hold property to the amount of \$50,000. This charter would be amply sufficient for all the purposes contemplated by the new association. If the society were therefore somewhat enlarged and modified, uniting distinguished botanists and men of science with gentlemen of more practical views, and extensive and valuable institution might be immediately built up. Ground for a botanic garden might be purchased this Spring, without the delay and doubt of obtaining a new charter from the Legislature, and without leading to any of those unhappy collisions, which would hereafter inevitably arise between rival societies. As the members of the existing institution are only ambitious of promoting the public good, we have no doubt they would accede to any proposition, which should have a tendency to promote the interests of horticulture, and thereby confer lasting benefits upon the State and the country at large.—*N. Y. Star*.

Communicated for publication in the American Farmer.

JONATHAN ROBERTS, ESQ. PRESIDENT OF THE PENNSYLVANIA AGRICULTURAL SOCIETY.
Powellton, Nov. 23, 1823.
Philadelphia County. }

DEAR SIR,—I enclose certificates showing that sixteen hundred and thirty-four bushels of Mangel Wurtzel, weighing seventy-eight thousand four hundred and forty-eight pounds, were produced at Powellton, upon one acre and fourteen perches of farm land, accurately measured by a regular surveyor.

I selected a parallelogram, containing thirteen contiguous rows, which were drawn, and measured in my presence, to ascertain the largest quantity, which had grown upon the richest part of the field. One hundred and forty-three baskets, equal to one hundred and seventy-four bushels, were produced upon thirteen and an half perches, at the rate of two thousand and sixty-five bushels per acre, weighing 41 tons, 5 cwt. 0 qrs. 27 lbs.

I am satisfied that the account of my farmer is correct, and as the roots had been drawn ten days, had been closely cut beneath the crowns, were dry, and entirely free from dirt, both the measurement by the basket, and the estimate by weight, must be fair. If a barrel had been used, or any other large vessel of similar shape, the crop would appear greater, as the measure would not have been so often filled, and consequently, not so often heaped.

Mr. Milnor, the Recording Secretary, was good enough, to superintend the measurement of the basket, and saw the manner in which it was filled.

I submit to you the shingles containing the original scores, and refer you to him, for corroboration of the facts. It may be well to state, that however great this crop may appear, in England a larger product has been obtained.

My soil was not naturally strong; it has been gradually so much deepened, as to enable me, with Wood's plough, No. 2. drawn by four oxen, to plough fourteen inches deep. Fresh barn yard manure, was equally spread upon the surface, and ploughed under in the early part of April, in quantities not larger, than are usually applied to potatoe crops in this country.—Early in May the land was twice stirred with Beaton's scarifier—harrowed—rolled—after stirred—harrowed and rolled again in the opposite direction. The holes for the seeds, were made by wheel containing pegs in its circumference, which penetrated the ground, about an inch, leaving intervals of four inches—the rows were made two feet asunder—two capsules were dropped into each hole—the wheel of a common barrow was passed over them, thus compressing the earth, and leaving a slight rut, for the retention of moisture.

A small cultivator which I had contrived for the purpose, was drawn between the rows soon after the weeds appeared; a three inch triangular hoe, removed the alternate plants, leaving the others at distances, varying from eight to twelve inches asunder. The cultivator was twice used before the 20th of July. The heavy rains of August made another hoeing necessary, and surcharged the ground so much, with moisture, that roots increased much less in that

month, than they had grown during the same time, in the two last years.

In order to convey an idea of a Mangel Wurtzel crop, to some of the members, who are not acquainted with its usual product, it may not be improper to state, that three fourths of the root extend above the ground—that I last year obtained one which at Mr. Landreth's shop weighed some days after it was drawn, 17 lbs. 10 ounces.

I this year desired smaller roots which might grow so closely, as by their leaves, to protect the soil, as much as possible from the exhalations of the sun. My cultivator, by its peculiar form, enabled me to cut off the weeds, when the plants were so young, that if I had applied the plough, their crowns must have been covered in many instances, by earth which occasionally falls from its land side. The failure, which attends the cultivation of most root crops in drills, proceeds from the neglect of weeds in their early stages. Four or five days of delay, frequently make the difference of fifteen days in the labor of making clean an acre of ground. The same weeds which a boy with a sharp shingle, could remove at the commencement of one week, may, before the end of the next, require the application of an implement drawn by a horse.

I ascribe my success, in a great measure to the use of Wood's extraordinary plough, which enters the soil more deeply, and pulverizes it more perfectly than any other I have ever seen with equal force in any country—to the habitual use of cultivators, which complete the production of fine tilth—to the destruction of the weeds on their first appearance—to leaving the smallest space upon which a horse can walk between the rows, and above all to planting the seeds of a proper kind upon a surface which is kept perfectly flat.

In proof of the advantages of this invaluable root, I exhibit cream obtained from one of my cows, which has been fed for several weeks, exclusively upon Mangel Wurtzel and Millet fodder. You will find that its color and flavor are perfectly good—the butter which it affords, is more like that produced in June, than any I have used, excepting such as had been derived from cows fed on carrots, and corn meal.

Notwithstanding the large product, I am confirmed in the opinions, which I have repeatedly expressed, that in this country, nothing can supplant the king of vegetables, Indian Corn. I would recommend Mangel Wurtzel, in preference to all other roots, for dairy and breeding farms: and to a limited extent, where labor and manure, are not too dear, in comparison with the value of land, it should be cultivated upon all farms.

The expense of preparation for a mangel wurtzel crop, is not so great as might be supposed.

The labor of four oxen, a ploughman and driver in ploughing one acre, 14 inches deep,* costs \$3.00

* The great depth of ploughing, was noticed by Dr. Buck, the Secretary of the Agricultural Society, at Bridgton, N. J. in an early number of the present volume; and we are authorized to assure our much valued correspondent of Talbot, that a Pennsylvania farmer although no Hercules, can plough fourteen inches, and obtain good crops, without the Angean filth of a great city.—*Id. Am. Farmer.*

Amount brought up, \$3.00
3 stirrings with Beaton's improved scarifier, which two oxen managed by one man, can readily pass over five acres in good condition, in one day, 1 20
2 harrowings and 2 rollings, 1 20
Dibbling with a wheel, 1 00
Dropping seeds, (if performed by men,) 5 00
Pressing them under by a wheel, 1 00
Hoing and thinning, 15 00
Cleaning with Blockley cultivator, drawn by one horse. 3 00

JOHN HARE POWELL.

JOHN S. SKINNER, ESQ.

Sir,—At a meeting of the Pennsylvania Agricultural Society, held in November, Mr. Powell exhibited a bottle of cream, produced by a cow, which he stated, had been fed solely on Mangel Wurtzel roots, and Millet hay. It was pronounced by all who examined it, to be equal in richness and flavor, to any they had ever seen.

His Durham short horn heifers, fed upon these roots, yield very large quantities of milk affording the richest cream I ever tasted.

Respectfully yours,

JOHN P. MILNOR,
Assistant Recording Secretary
Penn. Ag. Society.

Philadelphia County, March 3, 1824.

From the New York American.

Invention.—We noticed some time ago a paragraph in an English paper, giving an account of an engine for producing power which would supersede even steam, as an agent; but as this may be said to be the age of invention, we passed it over as not deserving immediate notice. We perceive, however that Congress during the present session, has passed a law authorizing the Secretary of State to issue letters patent to a Samuel Brown for this invention; and we are informed that Mr. Brown, has actually disposed of one half of his patent for this country, to two respectable mercantile houses, one residing in this city, and the other in Philadelphia—a partner in each house being now in England with Mr. Brown; and that they are all sanguine of success. It may be prudent, therefore, for those persons who are disposed to engage in operations requiring the application of mechanical power, to hesitate until the merits of this new invention are (as they must shortly be) fully tested. The advantages said to be possessed by the newly discovered agent over steam are, that with a much less consumption of fuel, and in a far less space, an equal power is produced. As a proof that the discovery is not chimerical, we have seen letters from Europe, stating that eighteen thousand pounds sterling had been offered for the patent rights of France, provided the experiment succeeded.

In Act to authorize the issuing of letters patent to Samuel Brown.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the Secretary of State be, and he hereby is authorized and required to issue letters patent in the usual form to Samu-

Brown, for his invention of a new and useful engine for producing power, by which water may be raised, machines worked, and vessels propelled without the aid of steam, upon the principle of the screw, and in full compliance with all the provisions of the several acts of Congress relative to the issuing of patents for inventions and improvements, except so far as the said acts require, on the part of aliens, a residence of two years in the United States.

Washington, Feb. 24. 1824. Approved.

From the Old Colony Memorial.

THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

take the liberty to communicate the following particulars respecting the culture of wheat of the past season.

The land measuring half an acre and twelve rods, consists of a rich loam, but a small part is very gravelly and apt to suffer by drought.—It produced a tolerable crop of Indian corn and potatoes the two preceding seasons. In April it was covered with a full coat of stable manure, and on the 15th and 16th of the month, it was ploughed twice and harrowed; after which the wheat and grass seed being sown it was again harrowed. The wheat was immersed in sea water for twenty-four hours and afterwards rolled in time. The quantity sown was one bushel, and of that species of wheat from which the straw of which is employed to make horn bonnets. The wheat exhibited the most favorable appearance during the season, being free from smut or mildew and in August it was harvested. The produce is eighteen bushels, one peck and two quarts. The grain is remarkably well formed, and being ground and bolted, the flour is not inferior to the superfine flour brought from the southern States. The land is now covered with a superior growth of clover and herdgrass.

This is among the instances in proof, that our climate and soil are well adapted to the production of summer wheat. One of my industrious neighbors obtained, a few years since, 31-2 bushels from one acre; and another has obtained in his family no other flour than the produce of his own soil for the last five years. Farmers in this county are greatly deficient in their attention to this object, though it is believed that every farm would afford suitable land to yield wheat sufficient for the consumption of a family. On the principle of promoting the cultivation of wheat ought to be encouraged, more especially as it is found to be the preferable grain to accompany clover and herdgrass for mowing the ensuing year.

I am, with respect,

your obedient servant,

JAMES THACHER.

Plymouth, Nov. 1823.

THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

GENTLEMEN.—The land that raised the Ruta this year, for which I applied to your society for the premium, is an enclosure of one acre, on the edge of a fresh meadow, under the southern declivity of a hill, and commanding a plentiful wash from the adjoining high-

side of the spring of 1822, it was newly en-

closed and planted with corn and potatoes.—About twelve loads of loam manure were put into the hills. It suffered much by the drought, but gave twenty bushels of Corn, one hundred bushels of Potatoes and three or four cart loads of Pumpkins.

About the last of May, 1823, it was ploughed, and on the 16th, 17th and 18th of June, it was covered with about forty loads of sheep litter and coarse barn yard manure, (and being very wet,) thrown into ridges, as high as they could well be made three feet asunder.—On the top of these ridges half a pound of seed were sown, with a very simple hand-drill, invented by Wm. Jackson, Esq. of Plymouth.—The 29th, 30th, and 31st of July, it was hoed, thinned, and the wants supplied by transplanting. It had two hoeings afterwards, and the 13th of November the crop was gathered, and amounted to 429 1-2 bushels, making twelve stout cart loads. In some places the ground was too wet, and the crop almost entirely failed.—I have no doubt that in others the produce was at the rate of more than a thousand bushels to the acre.

Expense of Cultivation, viz.

Twice ploughing with yoke of oxen, horse, man and boy,	\$4 00
Ten days men and boys furrowing & planting,	5 00
Forty small loads coarse manure,	20 00
Ten days men and boys, 3 hoeings,	5 00
Four days men, boys, and team gathering crop,	2 00
	\$36 00

Charging all the manure to this crop, it appears to have cost something less than eight and a half cents per bushel to produce a food for cattle, sheep or horses, decidedly preferable to any green vegetable, we have heretofore been acquainted with.

This experiment, (which I consider almost a failure, for I have no doubt 1000 bushels may be raised from an acre at the same expense,) I hope will induce the farmers of our county to give more attention to green crops in general, and Ruta Baga in particular.

WM C. HAMMATT.

Scituate, 15th Nov. 1823.

I certify that I assisted Mr. William C. Hammatt to gather and measure his Ruta Baga above described, and that there was four hundred and twenty-nine and a half bushels.

JOHN SAMPSON.

TO THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

GENTLEMEN.—The following is an exact statement of my proceeding and management with an acre of land upon which I raised a quantity of corn the present year, and for which I have entered my claim for a premium from your society.

The land is situated on the westerly side of my dwelling house and other buildings, and is naturally of a deep rich soil. In November, 1821, when it was green sward, I foddered my cattle, consisting of about twenty head, upon the lot until May 1822, intending to prepare it for raising a large crop of corn. In May, 1823, I ploughed it very deeply into squares of two feet seven inches in width. I then manured it in the hole, putting on 64 cart loads of barn manure. It was planted partly with what is

called smutty white corn, and the rest with a flesh colored corn, having a small cob, and which is considerably used in the town of Middleborough. I was particular to have the kernels placed about 4 inches apart, and then covered in the usual way. By the middle of July the corn was spindled, and grew very thick together, filling every space, like a field of rye, and the rows were scarcely discernable. It was hoed three times only, and was ploughed but once, and that at the second time of hoeing, and all the suckers were early cleared from it. On the first of October, I gathered this acre of corn, and carried it into a field in heaps, where it was husked. It was then measured in a basket, shaking every basket full, that it might lie as solidly as possible. I employed two interested men specially for the purpose of measuring. One other person also was present and kept the tally for his own curiosity. All these three agree in their reckoning, and make out the amount of corn to be 118 1-2 baskets. In order to ascertain the amount of shelled corn, the same basket was filled in the same manner, averaging the ears as to size, &c. by the same persons, and then shelled, and measured by them. The amount of shelled corn was three pecks, six quarts, and one gill to a basket. This method of ascertaining the quantity of shelled corn was tried twice, and the results were alike almost exactly. Therefore according to the above measurement the acre of land produced 139 bushels, three pecks and one quart. I knew of no way of ascertaining the amount of corn produced better than the one I adopted, and presumed it would be approved of by the Board of Trustees, as in the year 1821, I had the honor of a premium from them for raising an acre of corn measured in the same manner, producing about 30 bushels. I was confident that I could raise a greater crop, and was determined to make the experiment, which I have done in the present instance.

Respectfully yours, &c.

LEONARD HILL.

East-Bridgewater, Nov. 3, 1823.

NOTE.—Mr. Hill raised this year, on a small lot of land, containing but 89 rods, 34 bushels, 3 pecks, 6 quarts and one pint of excellent rye.

(To be continued.)

From the Wilmington (Del.) Watchman.

To the friends of Inland Navigation.

GENTLEMEN.—Having completed a model (made to a true scale) of my invention for saving and reapplying water to canal locks, I have the pleasure of announcing that on Saturday the 27th inst. I shall commence to perform operations upon said model, which will more than justify all that I have permitted to be said in favour thereof. The operation will clearly prove that sloops or other vessels may readily be passed through canal locks of 10 feet lift, in the short space of 4 minutes, with perfect safety, and at the same time, eight tenths of the water commonly lost, saved and reappplied—which never has heretofore been done, to wit, saving and reapplying the water, and at the same time expediting the passage of vessels. An operation has already been performed to the perfect satisfaction of a number of intelligent gentlemen well acquainted with the Arts and Sciences.

JAMES PRESTON FAIRLANE.

NEW ENGLAND FARMER.

SATURDAY, APRIL 3, 1824.

FARMER'S CALENDAR.

IRRIGATION, OR WATERING LAND. It will be proper at or about this time to give a very particular attention to your water courses, and other means of watering your land. Some writers advise not to admit water on grass ground till late in the spring, or till the crop begins to feel the effect of drought. But we believe this to be erroneous. One of the principal objects of irrigation is to make use of water as a *carrier*, to convey certain substances to the soil, which may have a tendency to enrich it. When this is in view the water should be made use of when the streams are high and muddy, which generally happens at the time the snow is melting. At that season the water is surcharged with fertilizing particles. Moreover, many temporary streams, laden with manure, or rich earth, perhaps oozing from dung heaps or escaping from a cow yard, may, with a little attention be made to deposit their burdens in places, where they would greatly benefit the land and the crops of the owner of the premises. No good cultivator will suffer any more of the wash of his soil to glide away from his premises than he can avoid, before it has been arrested, and in part absorbed, and forced to leave its food for plants behind it.

When water stands high in brooks, rivulets, &c. it may be carried over higher parts of a farm than could be in dry seasons, and spread where its deposits are most needed. It should be made to run in courses or channels, which have no more descent than is necessary to prevent its becoming stagnant. If water intended for irrigation moves slowly, it leaves its riches behind it; if it runs rapidly it carries away the farmer's riches with it. In the first case it is an auxiliary or purveyor, in the second a robber of the soil. Perhaps horizontal furrows drawn at proper intervals, with the aid of some implement like that of which we gave a drawing and description in our first volume, (page 14,) may be found useful in some cases, in detaining water and preventing its passing too rapidly over land which is sloping or situated on a declivity. Or the system mentioned in the Code of Agriculture may be pursued in which, "after water is brought from the original stream into a new cut, it is stopped at the end, so that when the trench is full the water is compelled to run out at the side and flood the land below it. But as the water would soon cease to run equally for any considerable length, and would wash the land out in gutters, it has been found necessary to cut small parallel trenches, at the distance of from 20 to 30 feet to catch the water again, and the same plan of spreading and diffusing is continued till the water reaches the main drain at the bottom of the meadow."

When the chief object of irrigation is to add to the soil the substances suspended in the water, it may be well, when practicable, to take the water out of the stream as near its bottom as possible. The water in proportion to its depth will convey a larger or smaller quantity of mud, and other fertilizing matter. Trunks, gates, &c. may be so contrived in many instances, as to afford the lower strata or layers of water instead of the surface of the stream.

Much good may be effected by farmers, in many situations, by making a judicious use of the wash of large roads, especially early in the spring. At that time the water, composed chiefly, of melted snow and ice, is thick and turbid with the manure, dropped in the snow path of the preceding winter. A little attention, with nothing more than a common hoe, may sometimes enable a farmer to manure acres, with the foul water of a highway, with a small expense of time and labor.

MANURE. It is about time to clear your barn yard, and manure your fields with its contents. Having laid it near where it is to be used, you will be so good as either to spread and plough it in as soon after spreading as possible, or cover it with earth, sods, or some other substance, which will protect it from the sun and rain, as well as absorb the gas or effluvia, which might otherwise

"Waste its sweetness on the desert air."

You may about as well suffer your hay cocks to be bleached and washed as your manure heaps, unless there is some suitable substance to coat, underlay, or mix with the animal and vegetable substances, which they contain. Much has been said on the subject of scanty manuring our lands, and perhaps the most prominent faults in American husbandry are half tilling, and deficient manuring. But there may be such a thing as *too much* manuring, and this is a fault to which some wealthy and theoretical farmers are somewhat prone. They fill the soil so full of vegetable and animal substances that it almost needs paring and burning to fit it for cropping. Indian corn will bear over-manuring, or rather it is almost impossible to manure too highly for that crop. But when your ground is manured too highly, and in the course of your rotations you come to grass, particularly to clover, the stalks or spires, where it is thinly sown will be nearly as big as your thumb, and as hard as a ratan, and where thickly sown it will commonly be lodged, a part will be whitened or bleached like blanched celery, and the greater part of the other part will be rotted more or less; and in fine it will require something more than the stomach of a horse to make away with it. Notwithstanding our having frequently seen and noted this kind of bad husbandry, the current of authority sets so strongly against light manuring, that we should not venture to stem it, were we not able to bring up in the case of Sir John Sinclair. That eminent writer says [Code of Agriculture, page 133.] "The quantity of dung to be applied is an important question. Formerly *too much was given*, and the crops surfeited by abundant nourishment. According to modern practice, only as much is furnished at one time as will fertilize the ground, and render it capable of producing good crops, until a fresh supply can be administered. Formerly, from 20 to 30 tons were given, per acre, whereas now, half that quantity is found to be sufficient."

Be very particular in spreading your manure evenly, so that every portion of the soil may have its due share; and not let it lie about in lumps as big as a horse's head as the manner of some is. An experienced and judicious farmer will give a pretty good guess as to the number and size, and distance from each other, of his heaps, in order to bestow a certain quantity on an acre, and have it equally distributed. But some young cultivators would like a rule to go

by; and we will give them a table invented by a Mr. Close, an English agriculturist.

Number of heaps to a load,	Number of loads per acre.					
	1	2	3	4	5	6
At 5 yards distance,	193	96	64	48	38	27
At 5 1-2 yards distance,	160	80	53	40	32	23
At 6 yards distance,	134	67	44	33	26	19
At 6 1-2 yards distance,	114	57	38	28	22	16
At 7 yards distance,	98	49	32	24	19	14
At 7 1-2 yards distance,	86	43	28	21	17	12
At 8 yards distance,	75	37	25	18	15	10

Explanation of the first two rows of figures in the preceding Table.—The number of heaps consisting of one load each, laid at five yards distance, is 193 to cover one acre; at two heaps a load 96; at three heaps, 64; at four, 48; and so to the end:—each of the following rows is to be read in a similar manner.

The article on the *Myrica Cerifera*, &c. in a preceding page of this day's paper, refers to a plant known in New England by the name of Bayberry. The shrub which produces it is common in some parts of New England, growing in a wild state. Whether the plant could be improved under cultivation, its product increased, and rendered more subservient to purposes of economy is a question worthy investigation. We wish it might meet with the attention of those who would make the most of the use products of our soil and country.

FOREIGN.

War between England and Algiers.—Hostilities have commenced against Algiers, by Capt. Spencer of the British Navy, who attacked and captured an Alger Corvette, on the 31st of January last. On the 2d of February the Lords Commissioners of the Admiralty, gave notice that they would appoint convoys afford protection to the trade through the Straits of Gibraltar, &c. The causes of this warlike declaration, said to be two fold—one, the refusal of the Dey make reparation for an insult offered to the British Consular flag; and the other a declaration that he resolved no longer to observe the terms of a treaty made with him not to retain any Christian captive any nation, in a state of slavery.

A Lisbon article of Feb. 4, asserts that an expedition for Brazil is in active preparation. It will consist 12,000 men, and will be commanded by Lord Berford, who has received anew his staff as a Marshall, a Commander in Chief of the Portuguese troops.

Savage Curiosity.—No less than 137,000 copies of the London Observer, containing the particulars of trial and execution of a murderer, whose name was Thurtell are said to have been sold in London. The paper contained no less than seven large cuts, representing the different scenes, connected with the transaction. We doubt whether any good deed, which it could print in any situation or any circumstances could possibly have performed, would have excited a tithe the notoriety and attention which was bestowed on this horrid affair, and the perpetrator who was guilty of crime scarcely to be paralleled in the annals of human atrocity.

DOMESTIC.

A strange animal has recently appeared in this neighborhood, (Trenton, N. J.) which has excited the curiosity of many, and some alarm. His head is in form a cat's, and his track upon the snow does not resemble that of any animal known here. It is supposed to have killed and eaten sheep—keeps mostly in the open field. He does not leap fences, but climbs over as going a stairs. The hunters have not been able with good horses to overtake him, and the dogs keep at a very respectful distance in the chase; when he stops and looks round, they stop also.

A splendid Hat of exquisite workmanship and materials, is now competing by Mr. John Hurley, of

From the London Literary Gazette.

SIGNS OF RAIN;

An excuse for not accepting the Invitation of a Friend to make an Excursion with him.

An Original Poem, by the late Dr. Jenner.

1. The hollow winds begin to blow,
2. The clouds look black, the grass is low;
3. The soot falls down, the spaniels sleep,
4. And spiders from their cobwebs peep.
5. Last night the sun went pale to bed,
6. The moon in halos hid her head;
7. The boding shepherd heaves a sigh,
8. For, see a rainbow spans the sky.
9. The walls are damp, the ditches smell,
10. Cuckold is the pink-eyed pimpernell.
11. Hark! how the chairs and tables crack,
12. Old Betty's joints are on the rack;
13. Loud quack the ducks, the peacocks cry;
14. The distant hills are looking high.
15. How restless are the snorting swine,
16. The busy flies disturb the kine;
17. Low o'er the grass the swallow sings;
18. The cricket, too, how sharp he sings;
19. Pass on the hearth with velvet paws,
20. Sits, wiping o'er her whisker'd jaws.
21. Through the clear stream the fishes rise,
22. And nimbly catch th' incautions flies;
23. The glow-worms, numerous and bright
24. Illum'd the dewy dell last night.
25. At dusk the squallid toad was seen,
26. Hopping and crawling o'er the green;
27. The whirling wind the dust obeys,
28. And in the rapid eddy plays;
29. The frog has chang'd his yellow vest,
30. And in a russet coat is drest.
31. Though June, the air is cold and still;
32. The mellow blackbird's voice is shrill.
33. My dog, so alter'd in his taste,
34. Quits mutton-bones, on grass to feast;
35. And see, you rooks, how odd their flight,
36. They imitate the gliding kite,
37. And seem precipitate to fall—
38. As if they felt the piercing ball.
39. 'Twill surely rain, I see with sorrow;
40. Our jaunt must be put off to-morrow.

MISCELLANY.

FOR THE NEW ENGLAND FARMER.

APHORISMS.

Plan of Life.—There are some persons who lose all their days without any design, or particular object in view, and wear away existence with no aim, and of consequence with no good effect. Such people have been aptly compared with straws on a current of water, which do not go, but are carried. They pass their prime in fluctuating from one bubble to another, and at length having been waited through the straits of indigence, sink in the gulph of oblivion.

Idleness a hard Master.—No men have so little leisure, or so little enjoyment as those who have nothing to do but to enjoy themselves.—Persons of this description have been known to kill themselves, in order to kill time.

Economy.—With proper economy a few of the good things of life are sufficient for every purpose of real enjoyment; but without econo-

my, a princely fortune serves merely to give a sort of notoriety and splendor to want and embarrassment, which make them the more conspicuous and lamentable.

Bad Men their own Enemies.—A wise and good man is not an enemy to the foolish and vicious, but merely wishes to persuade them not to ruin themselves. He looks on bad men as a physician does on his patients, and prescribes for moral diseases, as the medical man gives directions for the cure of corporeal complaints.

Pursuits of Pleasure.—A life of dissipation is a hard life, and the votaries of pleasure lose all enjoyment in the pains they take to obtain the means of gratification.

Anecdote.—As the passengers of a stage were about to dine at the stage house, one of the guests took up the pepper-box from a castor and nicely sifted it over a fine piece of roasted beef. A French gentleman observing it, deliberately took his snuff-box from his pocket, and besprinkled its contents likewise over the same piece of beef. "Sir," said the first party, "what did you mean?" Why, sir, I suppose you love de pepper. I sar, love de snuff? The table were thrown into a roar, and willingly consented to commute their roasted beef for the amusement the manner of its loss occasioned.

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has just received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seeds, which added to his former collection makes the greatest assortment in New England—among them are 50 bushels early and late Peas, of various sorts; 150 lbs. Turnip, 100 lbs. RUTA BAGA, 200 lbs. Carrot, 100 lbs. Beet, 100 lbs. MANGEL WURTZEL, 50 lbs. Cabbages of sorts, Cauliflowers, 100 lbs. Radish of sorts, Lettuce of sorts, Turnip, Kail, Celery, SALSAFIE, SPOKZENERA, Onion, Leek, Sweet Marjoram, Thyme, Sage, summer and winter Savory, Lavender, Sweet Herbs, Chervil, Fennel, Burdock, Grass Seeds, viz.—Herds, red and white Clover, Fowl Meadow, Red Top—with a large collection of ORNAMENTAL SEEDS.

Garden Tools, viz.—Pruning and Budding Knives, Pruning Saws, Pruning Shears, Garden Reels and Lines, transplanting Trowels, Rakes, Dutch or Pushing Hoes, Flaying Irons.

Gooseberry and Currant Baskets, Honeysuckle, Garden Roses, &c. 1.00 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety, constantly for sale, such as Roses, Myrtles, Geraniums, Agapanthus, Orange Trees in fruit and blossom, Rosa Multiflora or Garland Rose, Mountain Dahlias, Laurustinus, &c. 50.00 THORNS or QUICKS for live fences.

ENGLISH CHEESE, and fine ENGLISH SPIT MEATS. March 27.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending T. LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

March 27.

NEW TOWN OFFICE.

JUST published by Dorn & Howland, a New Town Office, containing the General Laws of Massachusetts relating to the Choice, Powers, and Duties of Town Officers arranged under their respective titles.—For sale at their Bookstore in Worcester, and by RICHARDSON & LORIN, Boston. Worcester, March 1, 1824.

FRUIT & ORNAMENTAL TREE

FOR sale, as usual, at the KENRICK PLACE, in Brighton. The nurseries have been much enlarged, and contain a variety of Pears, Apples, Cherries, Plums, Apricots, &c.—Also, the finest Nursery budded Peach-Trees known in America; consisting a choice collection of about 30 of the most approved kinds in our best gardens, or seen in the markets. 7 trees are from 5 to 6 feet high, and sold at the Nursery at the moderate price of 33 1-3 cents each.

Of good sized ornamental trees; the Flower Horse-Chesnut; Flowering Catalpa; European Mountain-Ash; Weeping Willow; the evergreen Silver-birch and the Larch. English Walnuts and Butternuts, &c. of which are justly admired for their fruit. The latter is a hardy, handsome tree, and its bark valuable in medicine.

Currant bushes of the large prolific red kind, of sizes, by the dozen, hundred, or thousand, on moderate terms: Also the Black, White, and Champ de Mars. Red and White Roses; Lilacs; English Girdle Gooseberries, &c. &c.

Orders addressed to John, or William Kenrick, sent to the Brighton Post-Office, or the Office of Samuel Dana, Broker, in State-street, Boston, will duly attend to.

N. B. Trees will be packed in clay and mats shipping, and conveyed to Boston when ordered: gentlemen at a distance should employ some agent to receive and pay for them. March 2

BELLFOUNDER,

The Wonderful Norfolk Trotter, imported July 1 from England,

WILL STAND THIS SEASON, 1824.

At Twenty Dollars, and One Dollar the Groom. Money to be paid to the Groom at Covering.

THIS celebrated Horse is a bright bay, with legs, standing 15 hands high; his superior symmetry and action excel those of every other trotter in the State. He is allowed by the best judges in New England to be the fastest and best time Horse ever sent to that County. He has proved himself a sure seal and his Stock for size and substance are not to be passed; they are selling at the highest prices of Horses in Norfolk.

BELLFOUNDER was got by that well known and highminded Trotter, Old BELLFOUNDER, of a Velocity, which trotted on the Norwich road, in Staten miles in one hour, and through the brook 8 times into a gallop, and a dozen turned round, won match. In 1823 he trotted Twenty-eight miles in one hour and forty seven minutes, and has also done other great performances against time.

BELLFOUNDER, at five years old, trotted miles in six minutes, and in the following year matched for 60 guineas, to trot Nine miles in minutes, and he won easily by thirty-two seconds. He was shortly after challenged to a prium with him on miles and a half in one hour, but it was not accepted. He has since never been saddled or matched. Old BELLFOUNDER was a true descendant from original blood of the Firecracks, which breed of 1 stand unrivalled, either in this or any other nation.

BELLFOUNDER is strongly recommended to public by the subscriber, as combining more properties than any other Horse in America, and stand during the season, at his stable in Charlestown where all inquiries, post paid, will be attended to. SAMUEL JAQUES, Jr.

Charlestown, Mass. March 10, 1824.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of Mangels Wurtzel Seed, raised by John Knick, Esq., of Charlestown. Feb.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

NEW ENGLAND FARMER.

PUBLISHED BY WILLIAM MICHOLS, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. II.

BOSTON, SATURDAY, APRIL 10, 1824.

No. 37.

Correspondence.

Worcester, March 30, 1824.

MY DEAR SIR,—In the enclosed communication, perhaps I may appear too sensitive in the vindication of my remarks on ornamenting the public roads with useful trees. I know not the author of the strictures to which this is a reply. I owe him, however, much courtesy for his personal notice; and hope, that he will impute my ardor to no other than the feelings of a parent when his offspring are menaced with destruction.

Your friend, and obedient servant,

O. FISKE.

Thomas G. Fessenden, Esq.

Had the remarks of "A Farmer," in your paper of Feb. 28, been confined to your readers, they would probably have been seen by hose, principally, who could judge of their bearing upon the "ideas" contained in my Address—which has derived much of its celebrity from your republication—and would have required from me no reply. But as they have been copied into other papers, independent and lone, you will favor me, Sir, with a portion of the N. E. Farmer sufficient for an attempt to indicate my position. The writer has not on misapprehended the spirit of my remarks it has deviated from the letter. I said nothing of "ornamental trees" merely as such. I observed that trees, judiciously chosen and tastefully arranged, not only delight the senses by their beauty and soothing shade, but excite the pleasing reflection that they may become more substantially useful in some future emergency. The consideration of my agency in transplanting me in early life, gave me great satisfaction in contemplating their value as well as beauty.

I further stated, that in selecting trees for public roads, their use as well as beauty should be considered—and that with this view the Mazzard cherry, the ash, the maple, and the elm would be preferred.

The trees which perhaps I too boastfully mentioned, composed a single row placed on the south side of the road, except in the avenue to the meeting-house, where there are two rows shaded from them is confined to the highway; and their roots do not extend so far as to enclose the contiguous enclosures. But were there two, the road is sufficiently wide to prevent any injurious effects from their roots or shade. I agree with the writer "that most kinds of ornamental trees, wherever they stand, have an unfavorable influence on the ground in their immediate vicinity," but not so far as their shade extends." I should not prefer "ornamental trees" to stand in a plough-field or a garden: but surely in pasture ground, should not, like the writer, restrict trees which are useful for fuel or timber to the mere purpose of shade. The best and most durable timber is produced on open land. If they are named, as they should be, their rotary shade is no detriment to the pasture. The verdure in the vicinity of the maple and locust trees, and some other forest trees, and indeed under their most dependent branches, is greater than

elsewhere; and the sweetness and succulence of the herbage under them, gives no evidence that "the land is poisoned by the destructive influence of the tree." But, as I said nothing of trees in pastures, I shall no further controvert the opinion and practice of the writer on this head. I cannot, however, dismiss the subject without intimating my opinion, that, if he has cut down all the scattering trees on his farm with the reservation of here and there one to accommodate his cattle in hot weather, as "a Farmer" he has conducted unwisely. In some future emergency, he may need them for fuel if not for timber. This is a matter however of his own concern. But if, as he avers, he has transferred his work of destruction to the public highway, and, to the extent he mentions, has laid an impious hand upon large and splendid trees of thirty years' growth, whose lofty and beautiful appearance excited remarks of admiration from the passing traveller, he has done an act which no other man would be willing publicly to avow. Had he no gratitude for the comfort he had received from their protecting shade? Was his the only eye uncharmed by their majesty and splendor? Had he no sympathy for his friends and neighbors with whom these objects had been early and long associated with their happiest recollections? Had he no compunctions for such an outrage upon public feeling? Had he no misgivings at such a violation of public law? Such an infatuation is indeed possible; but as he has laid his scene in "Worcester," where such an act would not have been suffered, or would have been followed by an indictment, I charitably suspect that he has made a strong case for the sake of enforcing his argument. A man who would really do this without better reasons than are assigned, would subject himself to confinement as a lunatic, lest he should be left to pull down his barn or his house to admit the "rays of the sun" to a pumpkin vine!

If the road through his farm is unusually narrow, one of the rows would undoubtedly be prejudicial: but it is scarcely a possible case that both could be detrimental in proportion to their value. If "the ball wood or button wood" are too predominant, he would do wisely to cut them down and substitute a more useful kind. The button wood is neither good for fuel nor timber, and is not found on the list I proposed. Another tree the writer has mentioned, which I have not recommended. No one has a greater antipathy to the poplar than myself. I was the first to introduce this modern and fashionable *upas* into this neighborhood; and among the first to extirpate the deadly pest.

The trees I recommended (combining ornament and use, and from their hardness and cleanliness) I judged the best adapted for a public highway. They are not mentioned as the most suitable for front yards and enclosures about our dwellings. Here I should also prefer the cherry and pear "and other valuable fruit trees to

the poplar and elm and other useless shrubs." But after we have obtained a competent supply of fruit trees, are all others however beautiful, useful or ancient to be cut down, and their places left desolate; or are they to be replaced by the cherry and the pear? The "English," or Mazzard cherry, from its form and foliage, is an ornamental tree but beyond a competent number for use and to decoy the birds and boys from better kinds it is not sufficiently valuable for extensive cultivation. It is liable to injuries and disease; and to be infested with insects. It makes indifferent fuel; and when mature, its fissures render it unfit for timber. Every man who has land sufficient for the purpose, should cultivate the varieties of the cherry and pear and other good fruit; and protect and nourish them with care: but until he will take the trouble to prevent those in his enclosures from being disfigured and destroyed by the hosts of caterpillars which infest them, let him refrain from annoying and disgusting the traveller by their spectacle in the highway.

Editor of the New England Farmer,

SIR,—You request of me "a further communication for your paper"; and had I knowledge, commensurate with my zeal for the agricultural interest, it would afford me the highest pleasure "to communicate and do good." But the limited sphere in which I now move, and most probably ever shall, will debar me from ever attempting to write much. But whenever any little incident shall occur worth remarking, I shall most cheerfully contribute my mite.

In the spring of 1822, S. B. a neighbor of mine, lost by casualty a lamb of eight or ten weeks old. He split it through from the shoulder to the rump, with an axe, and fastened it on the limb of an apple tree, by a withe. The tree was a thrifty and healthy one, but the limb, on which the lamb was fastened, produced apples a third larger and fairer than the other part of the tree. Although the above is not a matter of much consequence in itself, yet I think it may be received as evidence that the ALMIGHTY has prepared trees and other vegetation to receive nourishment by other means than through the roots.*

L.

BY THE EDITOR. It is a fact stated by philosophers, and proved by numberless experiments that the effluvia, or gases, which are evolved by the putrefaction of animal or vegetable substances constitute manure, or food for plants. Such gases, however, are not only offensive to the senses, but noxious to the health of animals. In other words the volatile products of putrefaction are life to vegetables but death to animals. The leaves of vegetables are analogous, and answer similar purposes to the lungs of animals. By the leaves plants inhale such gases, (particularly carbonic acid gas or fixed air,) as are beneficial to them, and at the same time, and by the same means they exhale, or give out oxygen gas, or vital air, which is wholesome when breathed by animals. Sir Humphrey Davy says animals produce a substance which appears to be a necessary food for vegetables;

* See an Act for more effectually Preventing of Tree-passes in divers cases.—Mass. Laws, last edition. vol. i. p. 204.—1783, chap. 29.

* See New England Farmer, vol. ii. page 259, article on the management of Fruit Trees. By D. W. Jew.

vegetables evolve a principle necessary for the existence of animals; and these different classes of beings seem to be thus connected together in the exercise of their living functions, and, to a certain extent made to depend on each other for existence." Plants are greatly benefited by the application of soap suds, and other liquid manures to their leaves. All plants obtain a part and some plants, such as the House-Leek, *Scemp virum*, and many of the mosses, derive nearly all their nourishment from the air, by the instrumentality of their leaves.

But though plants may be fed by their leaves it does not follow that the most eligible way of feeding them is to apply manure, especially in the shape of putrid gas to their branches or leaves. This is *manuring the atmosphere* to little purpose. For one particle of gas or manure inhaled by the tree, or its fruit in the experiment mentioned by our correspondent, hundreds of particles were given to the winds, and went to poison the air. One may as well think of feeding a man by his lungs as a plant by its leaves. A man may be intoxicated by the fumes of spirituous liquors, and cooks, it is said eat very little, as their appetite is in part gratified by the volatile particles of the provisions which they inhale by breathing. Yet nobody ever thought of establishing an inn or ordinary, in which the guests were to be regaled by the fumes of the alcohol, and roast beef, and noses employed instead of mouths as purveyors of nutriment to the animal frame.

We have no doubt but the application of putrescent substances to the bark or limbs of a tree, it may be in some degree nourished. But we think it to be a disagreeable, unwholesome, and wasteful mode of manuring the tree. A man might put a few hundred pounds of hops into a well of water, and that water, used for brewing, might, perhaps, require a smaller quantity of hops than it would without the infusion. But it would be a very extravagant mode of obtaining the requisite extract from the hop. And one may manure his plants by applications to the bark, the leaves, or the atmosphere near his plants. But this is not in common cases an economical mode of using manure.

We have been told by an agriculturist that he found great benefit from manuring his fruit trees with the carcasses of cats and other small animals, which he buried near the roots of such trees. Undoubtedly this practice is preferable to hanging or binding such substances to the limbs or bark of fruit trees. But the better mode of disposing of the carcasses of dead animals is that recommended by Sir Humphrey Davy; who says "by covering dead animals with five or six times their bulk of soil, mixed with one part of lime, and suffering them to remain for a few months, their decomposition would impregnate the soil with soluble matters, so as to render it an excellent manure; and by mixing a little fresh quick lime with it at the time of its removal, the disagreeable effluvia would be in a great measure destroyed; and it might be applied in the same way as other manure to crops."

Editor of the New England Farmer,

SIR,—In your thirty-third number I noticed an extract from a London paper, stating that a clod of earth moulded round the top of the trunk of fruit trees, will effectually protect them from the ravages of the caterpillar. I recollect seeing this recipe some ten or twelve years ago. A gentleman of my acquaintance, who had a young orchard much infested with caterpillars, tried the experiment, by placing large sods in the lowest crotch of

the trees. I examined the crops frequently afterwards, for a number of weeks, but could perceive no benefit from the application. The caterpillars, to appearance, were quite as lively, active, and mischievous after the experiment as before. The clod was afterwards applied by the hand to the nest—this proved the surest and most effectual remedy that I have ever seen employed.

If the clods were placed entirely round the trunk and fastened there, I doubt whether it would prevent the caterpillar from ascending, and I am still more sceptical as to its causing them to fall from the tree. The experiment however is a simple one, and its utility or inutility can be tested at a trifling expense, and without injury to the tree.

Yours, &c.

R. BRISTOL.

BY THE EDITOR. Our correspondent will recollect that we expressed a doubt as to the efficacy of the remedy against caterpillars, which we extracted from a London paper; and his statement must have a tendency to confirm our doubt, or rather to change doubt to unbelief. A respected correspondent from Albany, seems to be of opinion that a large sod, with the grass downwards, may preserve plum trees from an insect, which causes warts or excrescences, &c.* Clods of grass may, perhaps, be so deposited in or about the crotches or trunks of trees as to present barriers, which cannot be passed by such insects as do not use wings, to enable them to deposit their eggs, or carry on their depredations in and upon Fruit Trees.

* See N. E. Farmer, vol. ii. p. 262.

Editor of the New England Farmer,

SIR,—I believe there has never been any communication in your valuable paper respecting "dairy stock soiling" if any of your correspondents who are acquainted with this important branch of farming, will give a communication respecting the best method, their treatment to the stock, and such other information as they may think necessary, it would confer a favor upon one of your subscribers.

I am, &c.

E. F. G.

GREAT TREES.

The Louisiana Journal says—"We have now before us an account of a mammoth white oak, cut on Mr. Sager's land, in Virginia, the dimensions of which were as follows:—

"The stump measured 4 feet 10 inches across, and 11 feet 6 inches in circumference. When dressed to haul home, 3 feet 4 inches at butt, 3 feet two inches at the top, and twenty-five feet long. It was ascertained to weigh six tons."

Compared with the above, we have now growing in this parish, a sassafras which measures 13 feet in circumference, diminishing very little in size to the height of 25 feet—and a yellow poplar, measuring, at the height of six feet from the ground, 27 feet, and tapering gradually at least 30 feet, at which height, we presume, it would measure not less than 15 feet in circumference. The oak of every description grows to an extraordinary size, but we have never known any of the larger ones measured.

"The great oak at Pausanger," in England, is thus described in a late London paper—no

doubt there are many in the United States that are equally large; for, though our country is called "young," we have as old trees, and a many of them too, as any body else—"This favorite of Pan, and pride of our native woods is now flourishing in its pristine vigor, at the noble seat of the Earl of Cowper, in Hertfordshire. The following account of its dimension was taken May 6th, 1822—Girth, 2 feet from the ground, 20 feet 9 inches; 8½ feet up, 1 foot 6 inches; 15 feet up, 17 feet 6 inches; 2 feet up, and 8 feet above the first branch, 1 foot—inch. Length of the trunk, 80 feet; height of the tree about 90 feet. Diameter, feet from the ground, 6 feet 11 inches. Contents. cubic of the trunk, 681 1-2 feet—one arm, 84 feet; 29 other boughs, 371 feet quantity of timber in the tree, 1139 1-2 feet, twenty-two loads, thirty-nine feet and a half. The boughs extend to the north, 30 feet from the trunk; to the south 58 feet; to the east, 57 feet and to the west, 38 feet six inches. It is considered the noblest oak in the kingdom, has a single dead branch about it, and is perfect sound from the root to the top. There is every reason to believe that it is of great age; memory can trace it beyond one hundred year and at that time it was known as the Pausanger great oak. Within the last fifty years it has creased about one third in its solid contents.

From the National Advocate.

SALT.

A specimen of coarse salt manufactured B. Byington, at Salina, in the western part of this state, has lately been analyzed in this city by Mr. C. Chilton, Chemist, and is proved to superior in purity to any salt ever known in this market. The following is the statement of Mr. Chilton:—"The specimen of coarse salt with me for examination, and which is manufactured by Mr. Byington, at Salina, in State of New York, proves by a careful analysis to be muriate of soda nearly pure, 11 parts by weight yielded 994 parts muriate soda, 5 1-2 sulphate of lime, and 1-2 muriate magnesia, without any sensible deposit of soluble matter. A comparative estimate of value may be obtained from the following table of results of the analysis of the different varieties of salt by Dr. Henry.

	1000 parts consist of kinds of salt	Pure Mur of Soda
From bay salt	St. Ubes	960
	St. Martins	959
	Oleron	964
	Scotch (common)	935
	Scotch (Sunday)	971
Boiled from sea waters	Lymington (common)	937
	Pitto (cat)	938
	Crush'd Rock	983
Cheshire salt	Fishery	966
	Common	983
	Stored	982
	Byington's	994

IMPROVED PATENT HORSE CHECKER.

Mr. Peter Laporte, a respectable French gentleman, who is now a citizen of Virginia, brought to our office this morning, a new kind of bridle, lately invented and patented by himself, to render riding on horse-back, or in vehicles, perfectly safe with any horse, whether vicious disposition or dangerous propensity.

With it, the most untractable, hard mouthed horse, can be governed by the strength of the little finger, so that he can neither run, rear or kick, under its powerful operation. This is effected, by drawing his nose close to his breast, pinching both ears tight, and stopping his breath for a moment. In harness it has an additional effect by drawing the blinds over the eyes.—The bridle is made as cheap, and more ornamental than common bridles. The simple naffle bit is used, thereby enabling the horse to travel without that uneasiness and fatigue which the champing of the heavy, pinching curb-chain unavoidably occasions.

This valuable invention may be seen at the York House, in Courtland-street, or at a saddler's shop, near the corner of Pearl-street and Maiden-lane.

Mr. Laporte is the inventor of the new mail, approved by the Post-Master General, and General Bailey, Post-Master of this city.—We entertain no doubt of the utility of both inventions.—*N. Y. Statesman.*

TO THE EDITOR OF THE AMERICAN FARMER.

POORCHING OFF THE HAIR OF HOGS, BETTER THAN SCALDING.

MR. SKINNER,—In the 4th vol. of the American Farmer, page 223, there is an account of an English mode of cleaning hogs by singeing, which states that the quality of the bacon cleaned in this manner, was in much higher estimation, than that prepared in the ordinary way by scalding. My informant was Mr. James Searcy, a butcher, a few years since from England, now a resident at "Fells Point." In the Edinburgh Review of February, 1823, in an essay reviewing "Cobbett's Cottage Economy," page 15, there is a portion of Cobbett's works extracted, which details the English (or more properly the Hampshire) mode of cleaning by singeing. To my taste, no one is perfectly competent to give Cobbett's meaning in as satisfactory way as this singular man himself. I will extract so much of the "extract," as gives an account of cleaning hogs by singeing, hoping that Cobbett's manner of relating may attract attention, and give some one to make an experiment, and use us through the medium of your paper, the result of their experiments. Cobbett's words are, "there are two ways of going to work to make bacon; in the one you take off the hair by scalding, in the practice in most parts of England, and all over America. But the Hampshire way, and the best way is to burn the hair off; there is a great deal of difference in the consequences. The first method slackens the skin, opens all the pores of it, makes it loose and flabby by drawing out the roots of the hair. The second tightens the skin in every part, contracts the sinews and the veins in the skin, makes the skin a solidier thing, and the skin a better preparation to the meat. The taste of the meat is very different from that of a scalded hog—and this chiefly, it was, that Hampshire bacon and its reputation for excellence. As the skin is burnt off, it must be dry, and care must be taken that the hog be kept on dry litter of some sort, the day previous to killing. When the hog is laid upon a narrow bed of straw wider than his carcase, and only two or three inches thick. He is then covered all over thinly with straw, to which, according as

the wind may be, the fire is put at one end.—As the straw burns it burns the hair. It requires two or three coverings and burnings, and care is taken that the skin be not in any part burnt or parched. When the hair is all burnt off close, the hog is scraped clean, but never touched with water. The upper side being finished, the hog is turned over, and the other side is treated in like manner. This work should always be done before day light—for in the day light, you cannot so nicely discover whether the hair be burnt off. The light of the fire is weakened by that of the day. Besides it makes the boys get up very early for once at any rate—and that is something—for boys always like a bonfire."

Thus far Cobbett—for the sequel of his remarks contained in the extract, your readers are referred to the work as quoted. Let me observe that in my communication published as stated in the 4th vol. of the Farmer—that there is a typographical error, which I will beg leave to correct—towards the close, read "*Maryland lady*," instead of "*merry landlady*."

Yours, &c.

RUS-IN-URBE.

Baltimore, July 10th, 1824.

From the Railway Advocate.

PEACH TREES.

New York, 2d mo. 8th, 1824.

ESTEEMED FRIEND,—Being a great lover of good fruit, I have particularly regretted the loss of our Peach Trees by the worm, and have tried every remedy I could hear of, but all to little or no effect. At length I concluded, could I completely shield the parts likely to be affected, it would answer the purpose: I cleaned a number of trees and put a coat of *lime mortar*, about half an inch thick, round the body, then drew the earth up to it. These trees are now perfectly healthy, and there has not been the sign of a worm about them since, although it is about five years past that the experiment was made. I have since tried the same on a great number of trees with equal success.—Thou wilt communicate this to thy neighbor in such way as thou mayest think proper, as I wish it universally known. Thy friend

WILLIAM SHOTWELL.

James A. Bennet, Railway.

Incessant Incubation.—Last summer a turkey cock, the property of Mr. Thomas Brand, of Pentlow, in York county, 'took to setting,' and actually hatched no less than 50 head of poultry; namely, early in the spring he hatched five goslings; then he took to a duck's nest and hatched 11 ducklings; next ascended a skep which hung over his head, and driving away a hen which had been sitting there a week, he hatched a fine brood of 13 chickens; again betaking himself to a nest wherein eggs were laid daily, and setting closely for three weeks, he hatched one or two in a day, as the eggs had been laid, 20 more; and last of all, fixing himself again upon a duck's nest, he hatched nine more ducks. Thus ended the summer labors of this extraordinary turkey cock, who is now strutting about the farm yard among his numerous tribes, with the authority which his unwearied and patient perseverance to bring them forth entitles him to exercise.

TO THE EDITOR OF THE AMERICAN FARMER.

TO PREVENT BOTTS IN HORSES.

Morrisiana, March 23, 1824.

DEAR SIR,—The following observations if you think of sufficient importance, you may give a place in your paper, as I see the subject incidentally mentioned in one of your papers on the botts in horses. I knew a farmer of forty years experience, who told me that he never lost a horse with botts, and he was one of the most extensive breeders in this county. His practice was always to give his horses, particularly while in the stable, an handful of salt once a week to each horse. This practice I have followed on my farm for twenty years, and I never saw one of my horses afflicted by botts, I am also a considerable breeder. As a feed for young stock of that kind, I make great use of carrots, and I see none that look better or have better growth than my own.

Yours, respectfully,

JAMES MORRIS.

DIRECTIONS FOR BOILING POTATOES.

We copy the following from the Irish Farmer's Journal, a very good authority on such a subject.

How to boil potatoes nicely without waste.—Seldom do we see potatoes well cooked, and still seldomer do we see them cooked without waste. By the following directions both ends will be attained. Choose your potatoes of equal size, and put them into a saucepan or pot without a lid, with no more water than is sufficient to cover them; more would only spoil them, as the potatoes themselves, on being boiled, yield a considerable portion of water. By being boiled in a vessel without a lid, they do not crack, and all waste is prevented. After the water is come nearly to boil, pour it off, and replace the hot by cold water, into which throw a good portion of salt. The cold water sends the heat from the surface to the heart of the potatoe, and makes it mealy. Like all other vegetables, they are improved by being boiled with salt, which ought not, therefore, to be spared. The only proper test of their being done enough, is trying them with a fork. When they are boiled with a lid, cracking is usually considered as the test of their being done enough; but they will often crack when they are quite raw in the heart. After straining off the water, they should be allowed to stand ten or fifteen minutes on the fire to dry.

Simple Remedy for a Cold accompanied with a Sore Throat.—Take at night on going to bed a Clove of Garlic, cut so fine that you can swallow it, either in honey, molasses, water, or any other innocent liquid which will enable you to convey it into the stomach with a reasonable number of wry-faces. This will, in many cases, answer quite as good a purpose as to "Fee the Doctor for a nauseous draught."

To escape from, or go into a House on Fire.—Creep or crawl with your face near the ground and although the room be full of smoke to suffocation, yet near the floor the air is pure, and may be breathed with safety. The best escape, from upper windows, is a knotted rope; but if a leap is unavoidable, then the bed should be thrown out first, or beds prepared for the purpose.

From the Massachusetts Agricultural Repository.

Newbury, Nov. 25, 1823.

TO BENJAMIN GUILD, ESQ. ASSISTANT SECRETARY TO
THE MASSACHUSETTS AGRICULTURAL SOCIETY.

[Continued from page 276.]

SIR,—The production of an acre of land cultivated with English Turnips, by Joseph Little on the farm owned by him and his father, Silas Little, Esq. in Newbury, is here offered for premium. The soil is a clay loam, and had laid to grass for several years. The 29th of June, 1823, I took off the grass and it made short of a ton of hay. Ploughed the ground the 1st day of July, and harrowed and hauled on about thirty cart loads of compost manure, which I put into furrows made three feet apart on the second and third day, and after the manure was covered with a double mould board plough. The seed was sown at different times, viz: from the 3d to the 8th of July, and used one and a half pound of seed, and after seeding, the ridges were rolled with a hand roller. When the turnips were up, and out of the way of flies, they were thinned at the distance of more than one foot (which I think injured the crop), nevertheless I gathered six hundred and thirty-six bushels on the last of October, and I calculate the whole expense of manure and labor did not exceed forty-eight dollars; and that the turnips will bring eighty and the hay ten.

Yours with great respect,

JOSEPH LITTLE.

Newton, 24th Nov. 1823.

INDIAN CORN.

TO THE TRUSTEES OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

The first week in September last, before there was any frost, and while the corn was in the milk, I cut up about twenty hills of my corn, and the next day bound the stalks with the ears on, in small bundles and stacked them in the field, where the stack remained until the last of October. It was then carried into the barn, and the corn taken from the stalks. The corn was perfectly ripe, and sound, and the stalks sufficiently cured, to be packed in the mow. I send a few ears, taken from the stalks, without selection, for the inspection of your honorable board. A belief, that a knowledge of this fact, may, under some circumstances, be useful to the agricultural interest, has induced me to make the communication. It is not uncommon to have our cornfields injured, and sometimes destroyed by early frosts in the autumn. To guard against this calamity, must be a desirable object.

It seems now to be a settled opinion,* that there is no season so favorable for sowing grass seed as the early part of September. In cultivating the corn, the ground, having been frequently ploughed and hoed during the summer, is in the best preparation for this important object. If the corn stands to ripen on the ground, where it was planted, it is too late in the season for the purpose. The ground, consequently, cannot be laid down to grass, until the next spring, and one year's crop of hay is lost. This experiment has been made on a very small scale, and although it has succeeded far beyond my expectations, yet I would not re-

commend the practice, excepting on a similar scale, until further experiments are made.

If however I had a field of corn, late in growth, and there was a prospect of its being injured by frost, I should not hesitate to adopt the practice.

I have reason to believe, that in the event of an early, and unexpected frost, while the corn is in the milk, there is no mode so effectual for its preservation as to cut it up immediately after the frost, and stack it in the manner I have mentioned.

With much respect,

I am your most obedient servant,

WM. HULL.

Roxbury, 16th Dec. 1823.

ON INDIAN CORN.

TO THE CORRESPONDING SECRETARY OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

DEAR SIR,—Among the papers read to the Trustees on Saturday last, I observed one from Gen. Hull, on an experiment made by him the past season in cutting a few hills of Indian corn, by the ground in September and stacking it, which by the sample exhibited was well ripened, he appears to think it a new mode of treatment. I at the same time mentioned the same thing being done at a merino sheep farm of mine on the island in the Winnepesoga Lake in New Hampshire, on about six acres of corn, the subject appearing to be new to the Trustees, some of them thought it would be well to add a note to the General's communication in confirmation; with which I now with pleasure comply.

About the 8th of September last I was at the island, on one part of which, was five or six acres of corn in three or four different patches, (this island of near five hundred acres is in almost two equal parts divided in the centre by a neck of only eight or ten rods wide, one part is intended for mowing and cultivation, the other for pasture, so as to require as few fences as possible) the season had been uncommonly dry and the pastures generally very short, it was proposed to me by several good farmers, as a common method in that part of the country, to cut the corn near to the ground and put it in small stacks near the barn, and place a temporary fence round them, by which means my sheep could have the range of the whole island; I was pleased with the thing and it was done before the 12th of September, the farmers in the neighborhood were generally topping their corn, therefore it was considerably dry.

I was at the island again about the 20th of November, and found the corn in cribs, and in very fine order, much superior to mine at Roxbury, which was not harvested till about the 10th of November, all the stocks, butts, and leaves are excellent fodder, when by our usual mode the butts are of very little value.

I think considerable labor is saved by adopting this method although a little more handling in the husking will be required, which however is much more than repaid by the better quality of the fodder; and more particularly, as it will give twice to lay down the ground with winter grain, or grass seed only, at a season too, when it is now becoming generally considered the best time for sowing them. In four or five instances on my farm, within ten years, I have

sown grass seed in the autumn without grain, and even as late in one year as the 24th of Dec. and am decidedly of opinion that the grass takes better, gets better hold and is more lasting than if sown in spring, with barley or other grain, which being cut in the hottest season, leaves the young tender grass too suddenly exposed and is often burnt up.

Since the meeting of Saturday, I have looked into the American Farmer, third and fourth Volumes, and find several valuable pieces on the subject of cutting corn early and stacking it, in Maryland and Virginia; where it appears to be of great importance, in their mode of culture, by giving time to plough and sow their fall wheat in good season, there are however some writers who oppose it; but on the whole I think the plan excellent, but care should be taken not to do it too early; I should think it perfectly safe at the time we usually top it, and should recommend the stacks being small, not larger than the top stocks are usually made, to give a better chance for air to pass freely that it may more speedily be fit to house; in Virginia they put the corn of two hundred fifty to four hundred hills in a stack, which I should be apprehensive would not answer so well in our climate.

I hope Gen. Hull's hint will be improved upon, the next season, and the result reported to the Society. I am, dear sir,

very respectfully yours,
JOHN PRINCE.

From the Old Colony Memorial.

TO THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

[Concluded from page 285.]

GENTLEMEN,—I here give you a statement of my proceedings with an acre of corn, for which I have entered my claim for a premium.

Previous to the year 1822, the land was mowed for a number of years, and was generally yarded in the fall. It lies shelving a little to the east, and its soil is a yellow loam. In 1822 I planted it with Indian corn, and the last spring I ploughed down the hills and drew about 20 waggon loads of manure upon it, but I did not then think of claiming a premium on it. I was furrowed one way three feet apart; the other way about two feet or a little short of the distance. I planted it with large white corn putting four or five kernels into a bill. When we harvested the crop, it produced 119 bushels which basket was accurately measured and found to hold one bushel, one quart and half pint. I threw in the half pint to make the small corn equal with the larger. After casting it up, I found the amount of corn raised upon the acre to be one hundred, twenty-two and a half bushels and seven quarts. I consider the fodder to amply pay for the labor and the manure.

Respectfully yours, &c.

THADDEUS HOWARD.

West Bridgewater, Oct. 15, 1823.

TO THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

GENTLEMEN,—Having claimed the Society's premium for making the greatest quantity of best compost manure, I here state the manner of making it and the quantity made. In the fall of 1822, I ditched a piece of stump land and carted the mud into my cow yard and hog

* We do not consider this as a settled opinion.
Editors.

rd. I then collected my potatoe tops, which are thrown into heaps, when the potatoes are dug, and spread them over my cow-yard to prevent it from being muddy and to increase the quantity of manure. During the winter I fed six cows, four young cattle, and four oxen, when not employed in the team. In the beginning of June, with a large hoe prepared for the purpose, I turned the croppings of the cattle and waste fodder under the mud, and frequently during the summer, with a shovel. I turned the droppings of the cows under. I often ploughed and harrowed the yard during the months of July and August. After ploughing and harrowing, to prevent what I consider the best part of the manure from escaping into the air, spread on a covering of rich soil, which had collected and piled up for that purpose under the old walls, that I have been building anew, and from the places where I have since erected a barn. I yarded three lines in my hog's-yard, frequently throwing in rye, coarse grass, weeds and shelled corn, which kept them rooting and mixing the different sorts together. In the month of September I scraped the manure from the hog's-yard to the cow-yard, and heaped it into ridges. After the weather turned cold, I loaded, carted and heaped up the manure from the cow and hog yards, and as I loaded it I mixed in it loads of lime, which was slacked on the manure and was mixed. I have used manure prepared in this way two years on a thin, gravelly soil, which had been considered as worn out, and have obtained good crops of corn, potatoes, cabbages, turnips, ruta bagen, and all other kinds of vegetables in common use. I also got out in autumn a quantity of stuff that had been for several years accumulating in a brook, that runs through my pasture. This I placed about a barn under the windows and throwed the droppings of the cattle on it during the winter. Early in the spring I dug over the heaps and mixed part of the stuff under with the droppings, and with the remainder, I covered the sheep. This was carted out in the month of May, and part of it spread on my planting land, and part used in the hole for corn. I have a pond which is so calculated as to receive the wash of the road, house and barn. Into this I carted, in fall, soil, old rotten chips, &c. and have been throwing in the scrapings of the road, and every thing that was offensive about the house and yard, covering it up. This I have carted out and spread about the trees in a young orchard, which I expect to lay down to cover next spring. There were ninety one loads in the hog and cow yards; and twenty-five loads in the pit. I being from home when part of the other was carted out, there is no account kept except of twenty one loads. It is the opinion of the man, who loaded and helped load the whole of it, that there was not less than twenty five loads carted out, of which there was no account kept.

Yours respectfully,
ISAAC ALDEN, 3d.

East Bridgewater, Nov. 18, 1823.

THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

GENTLEMEN,—The following is my statement relative to a crop of wheat, for which I have claimed my claim for a premium.

The piece of ground on which I raised the wheat, contained one acre and eighty-nine rods, as measured by Mr. Ames, the surveyor. This lot I planted last year with corn, putting on fifteen loads of good manure, and it produced a very good crop. Last spring, I ploughed it three times, and put upon it three loads of rich manure. On the 24th of April, I sowed three bushels of clean wheat, being well washed and limed, and ploughed it in. The reaping took four days, and the binding and securing took two. Two hands threshed it in four days, and it was winnowed in one. The exact amount of wheat produced as above, was forty bushels and a half. All the above facts are certified by disinterested persons agreeably to the directions of the society.

Respectfully yours, &c.

EBENEZER COPELAND.

West Bridgewater, Oct. 1823.

TO THE TRUSTEES OF THE PLYMOUTH COUNTY AGRICULTURAL SOCIETY.

GENTLEMEN,—The acre of English mowing, which received the premium the present year, is a warm, loamy and good soil. In 1821, it was ploughed up, it being greensward and planted with potatoes, and manured with green manure, and a common quality—which produced a middling crop. In 1822, and in the spring of that year, twenty loads of good compost manure, was spread on the acre and ploughed in, and then was sowed three bushels and a half of oats, ten pounds of clover seed, and one peck of herdsgrass seed and what is called blue top; and there were from forty to fifty bushels of oats, that grew thereon, of a quality very excellent. In 1823, this acre was mowed, and produced five tons, five hundred and fifty-seven pounds.

The acre of oats, for which a premium was given, was greensward two years last fall, and planted in the spring following, when large quantities of compost manure were spread, and eight loads to the acre, put in the hill. The hills were split in the fall, and a large quantity of leached ashes carted on the acre, and left in heaps until the spring, when they were spread. The land was ploughed three times, the oats were ploughed in with ten pounds of clover seed, and one peck of herdsgrass, and blue top; and the oats were gathered in August, and produced as stated in the Report of the Committee.

The manure which obtained the premium was a composition of the liquor of lays, coming from the Soap establishment, mixed with common barn manure, soil and lime—and is supposed to derive much of its excellence, from the lays first mentioned.

ALPHEUS FOBES.

South Bridgewater, Nov. 20, 1823.

From the American Farmer.

PEDIGREE OF MR. POWELL'S STOCK.

VIRGINIA,

Was begotten in England, on Rosemary, by Mr. Curwen's General.

Rosemary, was by Flash, from Red Rose.

NEW ENGLAND FARMER.

SATURDAY, APRIL 10, 1924.

FARMER'S CALENDAR.

SPRING WHEAT. We have it in contemplation to make it apparent if possible that New England is, or at least may be made to be a wheat-producing country. We believe there is no more need of our importing flour from New York or from the Southern States than there is for our sending to the torrid zone for cargoes of sunshine.

"Some calculators have supposed, that the average produce of wheat over the whole face of the globe will not exceed six bushels reaped for one bushel sown. Mr. Livingstone has calculated the average quantity of wheat per acre, upon unmanured lands, throughout the middle, northern and eastern states, without taking in the new settlements, where the yield is much greater, to be thirteen bushels. In the Southern Atlantic States it is much less. It appears that in the single district of Newbury-Newton, Massachusetts, there were raised in 1817, by thirty-two persons, on fifty-eight acres of land, thirteen hundred and twenty-five bushels of wheat; making an average of twenty-two bushels to the acre, an average greater, it is believed than that of some of the most favored wheat countries. Mr. Emery raised thirty-three bushels on an acre; and Mr. Newall eighty-one bushels on two and a half acres. In New-Hampshire five persons raised on eleven acres three hundred and fifty-two bushels, equal to thirty-two bushels to the acre. If farmers will look over the accounts of late experiments on Spring wheat, even on the sea board in Massachusetts, where it is supposed to be the most subject to blight, they will find the average product to exceed twenty bushels. Mr. Taft, of Uxbridge, Mass. estimates the quantity of wheat raised in that town for three years preceding 1814, to have been one thousand bushels annually. We believe, therefore, that its produce is much more certain and profitable than is generally supposed."

It has been stated by one of the Vice Presidents of the Philadelphia Agricultural Society that the average crop of wheat in Lancaster county, which is considered the richest in the State of Pennsylvania, did not exceed fifteen bushels per acre. The average of all France has been rated at eighteen bushels. The average of all England is said to be twenty-four bushels. But in some counties as in Middlesex and the Lothians forty bushels to the acre is the estimated average crop. In Springfield, Mass. in the summer of 1816, four acres of land belonging to a distillery Company produced two hundred bushels. Payson Williams Esq., Col. Valentine and others, have likewise raised large crops of excellent wheat in Massachusetts. We believe, therefore, that there is nothing in our soil or climate to prevent the profitable cultivation of wheat.

There are many facts and reasons founded on facts, which almost irresistibly lead to the conclusion that lime or some other substance of a calcareous nature, such as marle, pulverized bones, oyster shells, and the shells of other testaceous animals are indispensably requisite for

the production of wheat. If none of those substances, and nothing analogous to them are native in the soil, they must be supplied or wheat will not grow to maturity. These considerations, however, we have urged so often that their repetition might prove unnecessary as well as tedious. Experiments of some Massachusetts cultivators have at least made this theory appear very probable, if they have not fully confirmed it.

That wheat may be made to grow without lime, in any of its combinations may be granted, and still it will not follow that lime may not be useful. Plants may be made to grow in pounded glass, in metallic oxides, in pure water, &c. but they are not healthy, and can scarcely, if at all be brought to perfection. Indian corn may be obtained from any tolerable soil, without manure, but it is, notwithstanding, best to manure for that crop.

Spring wheat should be sowed as early in the season as the soil can be tilled for its reception. It grows best on rich new lands, or on a soil, which has been well manured for the crops which immediately preceded the proposed wheat crop. It is apt to be stifled with grass and weeds, and should therefore either follow potatoes or some other hoed crop; or it may follow peas or a clover lay, if the land is free from weeds. If the soil be clay-loam, or inclined to clay it should be ploughed the preceding fall and twice ploughed in the spring, as soon as the frost will permit. The seed sown, should be ploughed in with a light furrow, then harrowed smooth, and if rolled it will be the better.

Col. Valentine of Hopkinton received a premium of twenty dollars from the Massachusetts Agricultural Society, and ten dollars from the Society of Middlesex Husbandmen and Manufacturers, for his crop of Spring wheat raised the last season. We have already published statements of his mode of cultivation, but for the benefit of some recent subscribers, who have not (as they should have done) taken the back numbers of the present volume, we shall repeat that gentleman's description of his mode of cultivation in the case alluded to.

"In the spring of 1822, the ground was ploughed and planted with Indian corn, forty tons of manure were spread and laid upon it, and the crop produced was one hundred and sixteen bushels, and twenty-eight quarts of corn, well dried and fit for use. In the spring of 1823, as soon as the ground was fit for ploughing, I had it ploughed twice and harrowed; three bushels of Gilman wheat were sowed on one acre and a few rods and ploughed in; I then sowed twelve pounds of clover, and half a bushel of herd's grass seed, spread one hoghead of slacked lime upon the land, and harrowed it well twice with an iron harrow. The wheat before sowing was washed clean in clear water, then soaked forty-eight hours in strong lime water, then laid on a dry floor and slacked lime sprinkled upon it, and frequently stirred until it was covered with lime."

By this mode of cultivation, Col. Valentine raised the great crop of thirty-seven bushels and one fourth of a bushel on one acre. And yet Massachusetts is not a wheat country! One might as well say that onions cannot be raised in Weathersfield, Conn.; that the Irish would find their account in importing potatoes, or that careful and calculating farmers must buy hay to keep

their stock through the winter. Wheat may be profitably cultivated by those who know how and will take pains for the purpose; and those who have neither intellect nor industry may as well confine themselves to crops of less value and now and then buy a little southern flour to entertain company, and confine themselves to the meanest products of their soil, instead of enjoying the best. The quantity of seed used by Col. Valentine was greater than that which has been generally recommended. From one and an half to two bushels to an acre is the common prescription.

MANGEL WURTZEL. The species of beet called Mangel Wurtzel appears to be about to become a very fashionable root among husbandmen and there is reason to believe that it merits more attention than it has, till of late, generally received. It is said to be a very sure crop, as the plant will endure the driest weather with less injury than most other plants. Its leaves are valuable, and it may be stripped several times without injury to the roots. But we do not know a better way to forward the culture of this plant than by giving the substance of certain directions, by Leonard Philipps, Jr. an English cultivator, who has lately received from the Society of London for the Encouragement of Arts, Manufactures, and Commerce, a gold medal for his success and exertions in removing the prejudices against, and extending the culture of this root.

"The seed should be soaked in soft pond water for six hours before sown, and it is requisite that the ground should be well pulverized without it is fine, to allow the roots to swell freely, they will become stunted and the crop spoiled. The season for sowing the first crop is from the middle of April to the end of May (for after crops the time of course will be according to circumstances); if the ground is not wet, and in good order the middle of April; the best time, should the weather be mild; not, about the latter end. It is the opinion of Leonard Philipps, Jun. after trying numerous experiments, to ascertain which method is preferable, that for general cultivation it is best sown upon the ground, where it is to remain either by machine or by hand, at two feet apart each way, and not more than three quarters of an inch deep; and to transplant none but the superfluous ones to fill vacancies: every case usually contains more than one seed, and only one plant should be suffered to remain at two feet apart. At the thinning them to single plants there will therefore be many superfluous ones."

"Six or more crops of leaves and stocks which are good food for cattle, may be taken off, during the growth of the root; women or children can take off the leaves, which is best done as follows: they should place their hands on each side of the top of the root, at the foot of the stalk of the leaves, leaving about six of the smallest central leaves between the fore finger and thumb of both hands, (the small leaves are to be left on the root to grow to make a fresh top) then spreading the hands flat, with their face downwards, push them both at the same time towards the ground, and thus by one motion will the whole of the top of each root, except the few small leaves, which are left to form a fresh head, be removed without unsettling the root or its fibres, which would check its growth: the leaves should be put into a basket,

which can be emptied into barrows or carts, according to the quantity required. Cultivators are given different descriptions of the effects produced on the roots by taking off the tops, some stating that it increases the weight of them, others that it diminishes it, and some that it does neither; but on Leonard Phillips, Jr.'s latter experiments, he is of opinion, that the leaves and stalks being taken off (in the manner before described) six times at least, will greatly increase the size of the roots; other cultivators have not taken off more than three crops; but he has ascertained that by taking off more the weight of the crop will be heavier.

"The forwardest experimental crop grown in his establishment in 1815, (which was not sown until the middle of May, for the reason above stated) had the green tops taken off six times, and weighed above two hundred weight per rod each time, which makes the weight of the six crops of leaves and stalks amount to over ninety-six tons per acre; and the roots taken up in the month of November weighed from twenty to twenty-six pounds each; and some of them weighed above twenty-eight pounds each; but taking the weight at from twenty to twenty-six pounds each (the average weight is twenty-three) the weight of the roots will be one hundred and eleven tons seventeen hundred weight and sixteen pounds per acre, making the whole crop of roots and tops to be one hundred and seven tons, seventeen hundred weight and sixteen pounds per acre, grown in the course of seven months upon unmanured ground, that had not been manured for seven years before and repeatedly cropped.

"The crop of roots should be taken up in November, before there is frost to hurt them, the tops being first taken off in the same manner as before described; the roots, being loosened by a potatoe fork, will draw well out of the ground; to stack them they should be laid upon the level ground, making the first tier about four feet wide, laying the roots across the tier, the two outside rows with the root end upwards, and thus continue the tiers till the stack is four feet high, making each tier narrower than the lower, so that the top will be of the width of a root, laid crossways; then place a moderate layer of any dry litter over the whole; and at a foot distance from the bottom tier, dig a ditch all round, banking the earth against the stack a foot thick all over."

"The above statement of the quantity of roots raised on an acre may seem incredible, and we have no other authority for the account than a bill, purporting to have been printed in London. We have before seen accounts of six tons weight of these roots, exclusive of the stalks, having been raised in England on an acre. The largest crop raised in the United States, of which we have seen any notice, is that of Col. Level, of Powelton, in Pennsylvania, which was at the rate of a little more than 44 tons to an acre. The mode of cultivation, &c. in obtaining that crop is given in page 284, of the present volume of the New England Farmer. The proper time for planting Mangel Wurtzel in New England is as soon as the ground is in a proper state to receive the seed in May.

DOMESTIC.

We do not remember seeing the following article published in any Boston paper at the time, (1805)

when the Report was made to the French National Institute.—*Boston Patriot.*

The Agricultural Society for the department of the Seine, held on the 8th Floreal, a very interesting public meeting.—M. Francois (of Neuf Chateau,) Report on the improvement of the plough, was particularly noticed. The prize proposed for that object was considerable; but notwithstanding the vast number of competitors, not one obtained it. The society distributed only five medals to five of the competitors. The second was adjudged to Mr. JEFFERSON, President of the United States. "The first magistrate of so great a Republic, said the author of the Report, 'attaching his name and glory to the improvement of agriculture, must be observed with much pleasure; it a remarkable incident in the history of our century and in that of the world.'" *[Foreign and Literary Gazette.*

Paray.—The pirates are becoming very daring and numerous about Cape Antonio, and the Isle of Pines.—A few days before the Caroline sailed, they secreted themselves in the mangroves in that quarter, where they had a piece of artillery, which they brought to bear on a boat from a British man of war, and killed one lieutenant, one midshipman, and five of the boat's crew.—*Philad. Gazette.*

Indiana Wine.—In the past season, the cultivators of the vine have had the most flattering success. At Vivay, Indiana, six persons alone manufactured 5,500 gallons of good wine.—*Mobile paper.*

Mr. Clement, a French Chemist, has lately invented an apparatus for the distillation of sea water, which produces six pounds of good fresh water by the burning of one pound of common coal. A single still will supply five hundred pints daily, and the distillation may be performed during the roughest weather.

John Johnson, who was convicted of the murder of James Murray, was executed at New York on the 2d inst. The concourse assembled on the occasion was immense, and estimated at 50,000 of all ages, and both sexes. The body of the culprit was given to the Faculty for dissection. Several gatraic experiments were tried upon it, and although life had been extinct an hour the muscles were violently convulsed, and even the lips and eyelids were put in motion.

State Election.—The votes for Governor in Massachusetts have been received from 232 towns, and are for Lathrop 30353, Eastis 33933. From the same towns, at the last election, the votes stood for Otis 26413, Eastis 29368.

Early Spring.—Green peas are stated to have been in blossom in the town of Cheraw, S. C. on the 20th of last month.

Three rogues were apprehended in Philadelphia, for having committed sundry larcenies, on the morning of Friday last. They were indicted, tried, convicted, and sent to the penitentiary before 12 o'clock at noon of the same day. *N. Y. Com. Adm.*

CONGRESSIONAL.

IN SENATE.—Friday, March 26. The bill making provision for the support of Government for 1824, after repeated discussions and amendments was read a third time, passed, and sent to the House for concurrence in the amendment.

After attending to some local matters the Senate adjourned to Monday.

Monday, March 29. The Senate, in Committee, took up the bill to enable the President to carry into effect the Treaty of Ghent, to prevent foreigners from trading with the Indians within the limits of the U. S. and to secure the trade to the citizens of the same.—This bill was made the order of the day for Wednesday next.

Tuesday, March 30. The 1824 Appropriation Bill as amended by the House was again considered, and the Senate having receded from some of its amendments the bill was ordered to lie on the table.

A bill from the Judicial Committee providing for the settlement of certain pecuniary claims against the U. States, by the establishment of a tribunal for their adjustment, instead of their occupying the attention of

Congress, was discussed in Committee, and ordered to lie on the table.

Wednesday, March 31. A statement of the expenditures for the several U. S. Armories, during the past year, and the arms made therein was received and read.

The amendments of the House to the Navy Pension Bill, restricting the payment of Pensions to the widows to the continuance of their widowhood, and to orphans to the age of 16 years, were, on motion of Mr. Lloyd, of Mass. concurred in.

Thursday, April 1. The bill providing for the settlement of certain pecuniary claims against the U. S. was discussed, its operation limited to three years, and passed to be engrossed for a third reading.

House.—Friday, March 26. The new Tariff Bill was again considered in Committee, but nothing very material was finally decided on.

Saturday, March 27. The Civil List Appropriation Bill, being under consideration, an amendment, by which the Senate proposed to appropriate \$2,600 for the salary of an Agent, under the article of the Treaty of Ghent, respecting slaves carried off during the late war, occasioned a long debate, in which fourteen Members took a part; and in which the amendment was opposed, on the ground that an Agent was not provided for by the Treaty, and was an unnecessary officer. In support of the amendment it was contended that the President had appointed the agent, (George Hay, Esq.) that he had commenced the discharge of his duty; and that his services were necessary to enable individuals to substantiate their claims for indemnity. The motion to strike out the provision for the Agent was carried, 97 to 52.

Monday, March 29. The amendments of the Senate to the 1824 Civil List Appropriation Bill were considered, and the House concurred with the Senate in striking out a clause which prohibited any person who received an annual salary from the government of the United States from receiving any thing in addition thereto for official services.

The House non-concurred with the Senate, in an amendment for appropriating \$2000 for improving the grounds near the President's House.

Tuesday, March 30. The new Tariff Bill was discussed, and Mr. Clay in a long and unfinished speech advocated the bill.

Wednesday, March 31. Mr. Allen, of Mass. gave notice that he should call up his motion for a recess on Monday next; and Mr. Randolph, that he should on Saturday call up his motion for lessening the per diem allowance of the Members of the House.

The consideration of the new Tariff Bill having been resumed, Mr. Clay finished his speech in support of it, and spoke in all 7 hours, during the two days.

Thursday, April 1. The House, in Committee, resumed the consideration of the new Tariff Bill. Mr. Rankin concluded a speech which he commenced yesterday. Mr. Webster of Mass. took the floor, and continued his remarks till past 3 o'clock, when he gave way to a motion for the Committee to rise.

PRICES CURRENT.

Ashes, pot, per ton, \$130.—Pearl, do. \$130.—Cheese, skinned milk, per lb. 3 cts.—Flour, Howard St. \$6.75 per barrel.—Rye, best, per bushel, \$3.25.—Oats, do. 30 a 32 cts.—Fork, bone-middlings new per bbl. \$15.—do. navy mess, do. \$12.50 a \$13.—do. Cargo, No. 1, do. \$12.—Herd's Grass, 1822, \$2.25 a 2.27.—Pork, fresh, 8 cts.—Mutton and Lamb, 4 a 12 cts.—Potatoes, per bush. 25 a 33 cts.; Cider, per bbl. \$3 a 4. *For other quotations see our last.*

NEW GARDEN SEEDS.

JUST received by the London Packet, and for sale by GEO. MURDOCK, No. 14, Market-square, an assortment of GARDEN SEED, of the last year's growth, among which are, Early and Late Cauliflower, Early and Late Cabbage, Early and Late Peas, Sweet Marjoram and Thyme, ARMACK, MANGEL WURTZEL, RUTA BAGA, &c. *Likewise*—a few cases of MARASCHINO and CURACOA, a Cordial much celebrated in Europe—French Anisette in baskets of 2 bottles each—Welch's No. 1 Chocolate, Cocoa and Shakes—green Madeira Citron, with other Groceries as usual.

Likewise—a few Hampers of Rich Cheshire and Loaf Cheese—London Brown Stout, in whole and half Bottles—English and French Mustard, in kegs and jugs.

From the New-York American.

THE CLOUD.

In the blue heavens, far away,
On the breathless eve of a summer day.
An empty vapor floated by,
Whose changing beauty caught my eye:
I turn'd me from this world of care,
And fix'd my meditations there.
At first, methought it seem'd to be
An angel isle in the boundless sea,
Where fairy beings love to rove,
And look from fields of light above,
And laugh at the good, and pity the wo,
That varies this scene of earth below.
A minute it staid—when that was o'er,
The isle and angels were no more:
And fancy, in their place, could form
The rage of war and the battle's storm—
Chariots, and horses prancing high,
Now mark'd the scene, in the clear blue sky;
And murdered wretches seem'd to lay,
All bleeding and torn, in the battle's way;
And dying victims seem'd to bleed
At the frighted spring of every steed.
But soon, as the vapor floated on,
The steeds and the warriors all were gone;
And as they chang'd, in the vaulted sky
I saw a sleeping Giant lie.
His robes of white around were spread,
As he stretched at ease on his azure bed.
His arms were folded on his breast,
In all the pride of a Giant's rest.
And as the gentle sun-beam shone
His face and mighty limbs upon,
He seem'd the form of some other sphere,
That had left its world, and wander'd here.
But now the cloud began to rise,
And mingle with more distant skies,
And the form of the Giant grew so dim
My eye could scarcely follow him:
Till softly—as he sleeping lay,
I saw his figure melt away.

MISCELLANY.

Bon Mot.—The Emperor Alexander, during the occupation of Paris, was present at the anniversary of one of the hospitals. Plates were handed round for contributions, and they were borne by some of the patron's wives and daughters. The plate was held to the Emperor by an extremely pretty girl. As he gave his Louis d'ors, he whispered, "Mademoiselle, this is for your bright eyes." The girl curtsied, and presented the plate again, "What," said the Emperor, "more?" "Yes, Sire," said she, "I now want something for the poor." The Emperor, amused by her ingenuity, repeated his donation. "Go, go," said he, "all your features are petitions."

The eccentric Captain Cochrane, who had undertaken the arduous task of a pedestrian tour through Russia and Siberia, for the purpose of minutely exploring that inhospitable region, and also for ascertaining the disputed fact of the separation of the continents of Asia and America, has, after two year's survey, decided the question in the affirmative, there being a continuous channel between the continents, though frequently blocked with ice during a great part of the winter.

Strange Legal Facts.—To burn the house of which the criminal is tenant at will, is capital, but if he has a lease, it is only misdemeanor.—To wound cattle is a capital crime; to wound man is only a misdemeanor. A comedian, who performs in a theatre royal is a reputed person, but if the same comedian plays the same character in a theatre which wants the stamp of royalty, he is a rogue and a vagabond. A gentleman of large property may hunt on the ground of a man of small property, while the man of small property may not hunt on his own ground. Peers and members of parliament cannot be arrested for debt, but their creditors may. [English paper.]

Geographical Curiosity.—At the bottom of a Wood belonging to Wm. Turton, Esq. of Knowlton-Hall, in Flintshire, is a rill of water called Sheddbrook, which empties into the river Dee; and when you step across, you are

In the Kingdom of England and Principality of Wales;
In the Provinces of Canterbury and York;
In the Dioceses of Chester, Litchfield, and Coventry;
In the Counties of Flint and Salop;
In the hundreds of Maylo and Oswestry;
In the Parishes of Ellesmere and Overton;
In the townships of Knowlton and Souldyht; and
In Mr. Turton's ground, and his neighbors.

[Bell's Weekly Messenger.]

AGRICULTURAL IMPLEMENTS.

FOR sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchants' Row, a great variety of new and useful Farming and Garden Tools, among which are the following, viz.:

Nixon's Patent Cast Iron Plough; Tice's do.; Seaver and Fay's do.; Wood's and Freestone's do.; Howard's Cast and Wrought Iron do.; do. Wrought do.; do. Double Mould Board and Expanding do.; Sinclair's Side Hill Plough; Beaton's Improved Scavengers and Cultivators; Harrison's and James' Patent Corn Shellers; Jaquith's Threshing Machine; Willis' Patent Straw and Hay Cutter, the most improved and best constructed machine for the purpose ever invented. One of the above Machines is now in use and may be seen at Miles' Livery Stable, Hawley Place.—Also, Safford's Patent Straw Cutters; Hand Straw Cutters; Bennett's Broad Cast Machine for Grass and other Seed; Corn and Turnip Drills; Stearns' Patent Steel Spring Hoes and Manure Forks; Brade & Co's. Cast Steel Hoes; Wright's Steel Plated do.; Common and Narrow do.; Merrill's Steel Crook Neck do.; Iron and Steel Potatoe do.; Turnip and small Garden do. of all kinds; Garden and Pruning Shears; Transplanting Trowels and Forks; English and American Shovels and Spades; Birbeck's polished Cast Steel Back Strapped Shovel, a new and very superior article; Cam's Cast Steel Scythes; Brush and other Scythes; Common and Iron Teeth Garden Rakes, together with many other valuable Tools.—Also, a New Improved Tree Brush for destroying Caterpillars.

♣ A liberal discount made to dealers in the above articles. April 3.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending **THE LORING'S IMPROVED LEAD PIPE**, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

FRUIT & ORNAMENTAL TREES.

FOR sale, as usual, at the **KERRICK PLACE, Brighton.** The nurseries have been much enlarged, and contain a variety of Pears, Apples, Cherries, Plums, Apricots, &c.—Also, the finest Nurseries budded Peach-Trees known in America; consisting of a choice collection of about 30 of the most approved kinds in our best gardens, or seen in the markets. Trees are from 5 to 8 feet high, and sold at the Nur at the moderate price of 33 1-3 cents each.

Of good sized ornamental trees; the Flower Horse-Chesnut; Flowering Catalpa; European Mountain-Ash; Weeping Willow; the evergreen Silver and the Larch. English Walnuts and Butternuts, 1 of which are justly admired for their fruit. The latter is a hardy, handsome tree, and its bark valuable in medicine.

Current bushes of the large prolific red kind, or sizes, by the dozen, hundred, or thousand, on in rate terms: Also the Black, White, and Chaamp do. Red and White Roses; Lilacs; English Grass Gooseberries, &c. &c.

Orders addressed to **John, or William Kenrick**, sent to the Brighton Post-Office, or the Office of Samuel Dana, Broker, in State-street, Boston, will duly attended to.

N. B. Trees will be packed in clay and mats shipping, and conveyed to Boston when ordered; gentlemen at a distance should employ some agent to receive and pay for them. March 2

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seeds which added to his former collection makes the greatest assortment in New England—among them at bushels early and late Peas, of various sorts; 150 Turnip, 100 lbs. RUTA BAGA, 200 lbs. Carrot, lbs. Beet, 100 lbs. MANGEL WURTZEL, 50 Cabbages of sorts, Cauliflowers, 100 lbs. Radish of sorts; Lettuce of sorts, Endive, Kail, Celery, SALSA SCORZENERA, Onion, Leek, Sweet Marjorie Thyme, Sage, summer and winter Savory, Love sweet Basil, Chervil, Fennel, Burnet, Grass &c. viz:—Herbs, red and white Clover, Fowl Meadow. Top—with a large collection of ORNAMENTAL SEEDS.

Garden Tools, viz:—Pruning and Bedding Kif Trimming Saws, Trimming Shears, Garden Reels and Ir transplanting Trowels, Rakes, Dutch or Pushing Ir Edging Irons.

Gooseberry and Currant Bushes, Honeysuckles, den Roses, &c. 1200 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety, constantly for sale, such as Roses, Myrtles, Gerani Agapanthus, Orange Trees in fruit and blossom, Multiflora or Garland Rose, Mountain Daisies, La times, &c. 50,000 THORNS or QUICKS for fences.

ENGLISH CHEESE, and fine **ENGLISH SI PEAS.** March 3

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of **M Wurtzel Seed**, raised by John Kenrick, Esq., ton. Feb. 2

NEW TOWN OFFICER.

JUST published by **DORR & HOWLAND**, A new 2 Officer, Containing the General Laws of Massachusetts relating to the Choice, Powers, and Duties of Ir Officers arranged under their respective titles.—For at their Bookstore in Worcester, and by **RICHARDS LORD**, Boston. Worcester, March 1, 182

TO PRINTERS.

FOR sale at this Office **BALL SKINS**, at the v prices.

TERMS OF THE FARMER.

♣ Published every Saturday, at **TERMS** Five p per annum, payable at the end of the year—let who pay within sixty days from the time of subscri will be entitled to a deduction of **FIFTY CENTS.**

♣ No paper will be discontinued (unless at discretion of the publisher,) until arrearages are p

Domestic Economy.

ROASTING MEAT. Let the young cook bear in mind that cleanliness is the chief cardinal virtue of the kitchen;—the first preparation for roasting is to take care that the spit be properly cleansed with sand and water; nothing else. When it has been well scoured with this, dry it with a clean cloth. If spits are wiped clean, as soon as the meat is drawn from them, and while they are hot, a very little cleaning will be required. The less a spit is passed through the meat the better,* and before you spit, joint it properly—especially necks and loins—so that the carver may separate them easily and neatly, and take especial care it be evenly balanced on the spit, that its motion may be regular, and the fire operate equally on each part of it;—therefore be provided with balancing skewers, and cookholds, and see that it is properly jointed.

Roasting should be done in the open air to ventilate the meat from its own fumes, and by the radiant heat of a clear glowing fire, otherwise it is in fact baked; the machines, the economical grate-makers call *roasters*, are in pain English, *ovens*.

Do not put meat too near the fire at first;—the larger the joint the further it must be kept from the fire;—if once it gets scorched the outside will become hard, and acquire a disagreeable empyreumatic taste; and the fire being prevented from penetrating into it, the meat will appear done, before it is little more than half done, besides losing the pale brown color which roasted meat should have.

If you wish your jack to go well keep it as clean as possible, oil it and then wipe it; if the oil is not wiped off again, it will gather dust;—to prevent this, as soon as you have done roasting cover it up.

Be very careful to place the Dripping-Pan at such a distance from the fire as just to catch the drippings; if it is too near, the ashes will fall into it, and spoil the dripping, which will occasionally be found an excellent substitute for butter or lard.

The time meat will take for roasting will vary according to the time it has been kept, and the temperature of the weather:—the same weight will be twenty minutes, or half an hour longer in cold weather, than it will in warm;—and if fresh killed, than if it has been kept till it is tender. Cooks seldom calculate according to the variation of temperature, &c.

Every one knows the advantage of *slow boiling*—*slow roasting* is equally important.

It is difficult to give any specific rule for time; but if your fire be properly made, and your meat skreen sufficiently large to guard what you are dressing from currents of air, and the meat is not frozen you cannot do better than

to follow the old general rule of allowing rather more than a quarter of an hour to the pound; a little more or less, according to the temperature of the weather, and in proportion as the piece is thick or thin,—the strength of the fire,—the nearness of the meat to it,—and the frequency with which you baste it; the more it is basted the less time it will take, as it keeps the meat soft and mellow on the outside, and the fire acts with more force upon it.

Reckon the time not to the hour when dinner is ordered but to the moment the roasts will be wanted. When the joint is half done remove the spit and dripping pan back, and stir up your fire thoroughly, that it may burn clear and bright for the browning; when the steam from the meat draws towards the fire, it is a sign of its being done enough; but you will be the best judge of that, from the time it has been down, the strength of the fire you have used, and the distance your spit has been from it.

About half an hour before your meat is done make your gravy. Mix a salt spoon full of salt, with a full quarter of a pint of boiling water, and drop this by degrees on the joint; and just before you take it up, put it nearer the fire to brown it. If you wish to *broil* it,—baste it, and dredge it with flour carefully; you cannot do this delicately nice without a very good light. The common fault seems to be using too much flour. The meat should have a fine light varnish of froth; not the appearance of being covered with a paste.

Though roasting is one of the most common, and is generally considered one of the most easy and simple processes of cookery, it requires more unremitting attention to perform it perfectly well than it does most made dishes.

The Cook's Oracle from which most of the foregoing observations are extracted and abridged, says that a sir-loin of about fifteen pounds will require to be before the fire about three and a half or four hours. It should be spitted evenly, so as not to be heavier on one side than the other,—“put a little clean dripping into the dripping-pan, tie a sheet of paper over it to preserve the fat, baste it well as soon as it is put down, and every quarter of an hour all the time it is roasting till the last half hour; then take off the paper, and make some gravy, &c. as before directed. If there is more fat than you think will be eaten with the meat cut it off and use it for other purposes, such as making pudding, frying, &c. About the same time, and similar management are proper for roasting ribs as for a sir-loin. The inside of a sir-loin should never be cut for the first meal, but be reserved entire for a hash, &c.”

Meat should be kept uncooked, till it has lost its organic elasticity, and the flesh may be indented with the finger, but beyond this it is not wholesome to keep it.

Roasting and broiling, however, greatly diminish the weight of meat. By far the most economical mode of cooking is boiling or stewing, and with proper attention to season and giving a flavor to food dressed in that manner the nicest palates may be gratified. Still as roasting and broiling are not likely soon to be

dispensed with, especially at the tables of the wealthy, those who roast, had better *roast by rule*, and thus become entitled to *rule the roast* among those who are fond of *exquisite eating*.

TO CHOOSE EGGS AT MARKET AND PRESERVE THEM.
Put the large end of the egg to your tongue; if it feels warm it is new. In new laid eggs, there is a small division of the skin from the shell, which is filled with air, and is perceptible to the eye at the end. On looking through them against a sun or candle, if fresh, eggs will be pretty clear. If they shake they are not fresh.—*Domestic Encyclopedia*.

Eggs, it is said, may be preserved by dipping them in boiling water, and instantly taking them out, or by oiling the shell; either of which way will prevent the air from passing through it. They may likewise be packed in a keg and covered with lime water. Or if packed with wood ashes in a barrel or other close vessel, so as not to touch each other, standing on end and the barrel turned frequently so as to stand sometimes on one head, and sometimes on the other, it is said they will be preserved.

Correspondence.

BLACK INK.

To the Editor of the New England Farmer,

SIR,—As you are fond of rational experiments, I beg leave to communicate to you the result of my endeavors to manufacture Black Ink. Although I have a recipe copied from the autograph of the Apostle Eliot, who in the church records of Roxbury prefixed, very appropriately, a recipe to make good ink, yet President WILLIAM FLEMING's proclamation, in the New England Farmer of November 1, to the clerks of courts, with a recipe annexed, took with me so much that I undertook to see, as good farmers should, how much it was worth by experimental knowledge. In the first place I went to our Apothecary for the materials. I might have got them cheaper, but I wanted all to be warranted. Here is his bill.

1 lb. Chips of Logwood,	17
1 lb. Aleppo Galls,	75
2 oz. Pomegranate Peels,	12
1-2 lb. Green Vitriol, or Copperas,	6
4 oz. Green Arabic,	8
1-4 pint Spirits of Wine, and Phial,	12
Salt of Tartar,	6

\$1. 36

The *Spaluta*, alias small pudding stick, was made by my boy. Well, sir, the next thing was to get an earthen pail-full pot of my wife, and she, good soul, let me have a new one from a parcel she had just bought to put in hog's fat. I took a gallon (beer measure) of brook water, put in the *logwood chips*, and boiled it thirty minutes. Then I poured off the decoction from the chips into the pot, (having previously put into it the *galls* and *peels*;) but as their strength did not appear to be exhausted, I ventured to pour on one quart more of hot water, which I also poured off into the pot, making five quarts of water in all. I set the pot on the hearth near the kitchen fire, for three days, stirring it three or four times a day with the spatula or stick. I

* Small families have not always the convenience of roasting with a spit,—a remark on roasting by a string is necessary. Let the cook, before she puts her meat down to the fire, pass a strong skewer through each end of the joint; by this means when it is about half done, she can with ease turn the bottom upwards, the gravy will then flow to the part which has been uppermost, and the whole joint be deliciously gravy-full.

think it was wrong to keep the pot so near the fire, for it dried up the liquor I am persuaded; and it convinced me, that the summer time is the most suitable to make the ink.

Well, sir, at the end of three days I added the powdered *copperas*, and continued to stir up the mixture several times a day for four days longer. Then I added the *gum*, dissolved in a quart of hot brook water, giving the whole a thorough stirring. I should not have agitated the mixture any more, but my girl Nancy, had got into such a habit of stirring it that she kept at it all day, when I went to work to strain it off from the dregs. I took a tight piece of coarse linen cloth, and it took me an hour to strain the ink through, the dregs were so fine and thick. After accomplishing the task, however, I measured it, and there were three quarts, lacking half a pint, of the six quarts, from first to last, poured into the pot. Some was *wasted* unavoidably, some was *dried* away as stated, and some was *absorbed* into the earthen pot. I poured it off into a stone jug.

I now took the *spirits of wine* and *salt of tartar*, shook them together well, strained the wine off, poured it into the jug; corked it tightly, shook it up well, and sat it aside.—You shall hear from it further. But meantime, as it appeared a sin to throw away so much costly stuff, (the dregs) I tried an experiment of my own, by putting two and a half quarts hot water to them, stirring all up in the aforesaid pot, to see whether another batch of ink cannot be made therefrom.

April 12. It is now about four months since the above was written. A day or two since, I took from the jug some of the ink, and after thoroughly shaking the jug, took some more. The first was pale, but the other of a very good color, and to my entire satisfaction. I am now writing with this "Fleming Ink," and think it will prove the best I have used for many years. Perhaps it may be doing a favor to some of your readers to know the result of this experiment.

W. S.

To the Editor of the New England Farmer,

SIR,—There is a problem that I have long sought for in vain which if discovered would be of great importance to the business of our country—it is

What size and descent must a Mill Race be to carry a given quantity of water in any given time? Or, in other words suppose there was a Race made of smooth planed boards 4 feet wide, 2 feet deep at the head with a descent of 3 inches in a rod, how many gallons or tons of water would it carry in fifteen minutes, allowing a cubic foot of water to be 62½ lbs. avoirdupois?

Or suppose such a Race of equal width for 10 rods as the velocity of the water would increase on an equal descent what depth would it run in such a race at the end of 10 rods if two feet deep at the head?

Algebraically considered as we know the specific gravity of water, the principles of falling bodies, and the size and descent of the sluice—the question may appear limited by having more given equations than unknown quantities. Yet by my few experiments, I find the depth of water alters the velocity, that the bottom and sides of any Race or Sluice will occasion a friction to retard motion. This may be proved by

scattering saw dust in a Mill Race—it will swim faster in the middle of the Race than near the sides—it will swim faster on top of the water than near the bottom.

Another difficulty, the deeper the water is on the same descent, the swifter it runs; and the swifter it runs the more passes in the same time, which decreases the depth and that decreases the motion.

A rule for our Millwrights to calculate by arithmetic how to form a Mill Race to carry a given quantity of water in a given time, would be the desideratum of their business; and he that may discover it ought to have his name perpetuated by honorable mention.

I am, with due respects to all men of science, your friend.

SAMUEL PRESTON.

Stockport, Pa. March 26, 1824.

SCIENCE THE HANDMAID TO THE USEFUL ARTS.

To the Editor of the New England Farmer,

SIR,—A few days since, I visited a Lead Pipe Manufactory. Inquiring of the manufacturer how much dross was formed, he said two or three hundred weight from a ton of lead, which is of course, something more than ten per cent. Asking what he did with it, he said, nothing. I suggested to him that if he would mix 12 or 15 parts of charcoal with one of dross (in bulk) and burn the charcoal the lead would probably be restored. He tried the experiment and in two or three hours with an inconsiderable quantity of charcoal he obtained 200 weight of lead.

Query. Would not some knowledge of science, particularly of chemistry, be useful to artists?

A Friend to Science and the Useful Arts.

From the American Farmer.

EXTRACT TO THE EDITOR,

Dated Washington, Pa. March 6, 1824.

DEAR SIR,—I sent you a small sample of our tree sugar, by a friend, who will leave it in the care of Mr. Henderson. It is from the parcel that took the first premium last fall. I consider it superior to common lump. My intention was to send you fifteen or twenty pounds of it, but it was all snatched up whilst I was engaged with the business of our society. I have bespoken some of this spring's making, which I shall send you. We are all alive here about the fate of the Tariff Bill, now before Congress. There is not the slightest doubt amongst us, either as to the expediency or constitutionality of an increase of duties. It is somewhat singular to remark the different aspects in which the same object will present itself to different individuals. We have here the consolation that no change can place us in a much worse situation than we are. No articles from our farms will bear transportation to market, with the exception of horses; and I fear they will not pay well.—We have had quite a mild winter—the medium heat for Jan. was 39 1-10, for February, 33 4-10 at twelve o'clock. I have no doubt but a thermometrical table would be a very desirable article to many of the readers of the Farmer. The subject has a close connexion with husbandry, and might be highly serviceable to foreigners who contemplate settling in our country. A table might be so arranged, as to shew at one view, the different

degrees of temperature in five or six places in the United States, and not occupy more than two pages of your paper. Should you think proper to publish such a table, I should with much pleasure furnish you with the necessary notes; as one of my sons makes regular notes three times a day—also of the wet days, and some other observations.

ALEXANDER REED.

NOTES ON THE PRECEDING.—By the Editor.

The people of the United States within the extensive region of country congenial to the growth of the sugar maple, are not aware, probably, of the treasure they possess in that very beautiful and majestic native tree of the American forests.—Imperfect as were the returns from only eight of the twenty six districts in which maple sugar was manufactured, in 1810, while they show the manufacture of nearly 10,000,000 of lbs. in that year.—The State of Ohio alone manufactured more than 3,000,000 pounds—many families make from 3 to 400 lbs. and were the whole Union to produce it at the same rate, we should, instead of importing produce more than double the quantity necessary for the consumption of the United States.—The time devoted to the making of maple sugar, is when farmers in grain sowing regions have little to do, being from the middle of Feb. to the end of March.—A single tree is said to have yielded 5 pounds of sugar in a season—forty trees frequently stand on an acre of land, and it has been calculated that with 34 trees to the acre, 500,000 acres, which is less than some single counties in the United States, would yield a supply for the whole of our consumption, as the population stood in 1810; or that a tract of 2,000,000 acres, whereof three fourths might be cleared for the plough, would have then sufficed, or say double that for our present population, making not more than one seventh of the land of New York or Pennsylvania.—In the returns before referred to, we trace the manufacture of maple sugar from Vermont in the north, to Tennessee in the south, embracing a district of several hundred millions of acres.—What would not the genius and the power of Napoleon have extracted from such resources?—The sapmentus us by Mr. Reed, is very beautiful in color, and of excellent grain—it may be seen in our office, where many have seen and much admired it.

[A writer in a late western paper makes the following remarks, which it may be of use to add.]

Another subject of much regret, and one which demands the early attention of the agriculturist, is the great destruction made among the sugar trees, by cutting them with an axe, instead of tapping them in a proper manner.—It would appear that those who thus destroy them, do not look forward and see what the consequences will be in a few years.

An improvement has lately been made in the manner of tapping the sugar tree, which, I hope, will be widely circulated, that it may supersede the barbarous use made of the axe in tapping them; and, in my opinion, it is preferable to boring them. I am informed it is used almost exclusively in the state of Kentucky.—It is this:

About one of the small roots of the sugar tree, dig a hole large enough to set the vessel

in, which is designed to catch the sap: saw of the end of the root, and it is accomplished. It is asserted that the sap will run more freely this way, than any other way yet discovered.

Among the advantages attending this manner of tapping trees, is this: the sap can be sheltered from animals, and from leaves and dirt, by placing a board over the hole. I hope farmers generally, will make a proper application of this important improvement. X. Y.

From the New York American.

Notice of some Experiments performed on the body of John Johnson, who was hung on the 2d April, for the murder of James Murray. By a Committee of the College of Physicians and Surgeons of New York, consisting of Doctor A. H. Stevens, Professors Mott and M'Nevin.

The deceased was a stout, athletic man, about 45 years of age. He was suffered to drop about four feet; was suspended about 45 minutes, and remained in his coffin, with a muslin dress over his ordinary wearing apparel, for half an hour. Afterwards he lay 15 minutes, between buffalo skins, making in all, one hour and a half between his execution and his arrival at the College.

The temperature of the air at the time was about 60° Fahrenheit.

At the commencement of the experiments, the extremities were three or four degrees below the natural standard; the body not at all so. The muscles were perfectly flexible.

The neck was not dislocated. The face and neck above the marks of the cord were livid. The expression of the face in other respects natural.

The galvanic battery consisted of the plates of Professor Griscom, Dr. Smyth Rogers, and Dr. Greenhow, added to those of Professor M'Nevin, in all, 323 pairs, of 4 inches square, acted in action by dilute nitric, and sulphuric acids; the poles being provided with leaden wires, armed with platinum wires at their extremities.

EXPT. I. The surgeon made incisions under the tendo achillis of either side; armed the tendons with tin foil, and connected them with upper wires, to which the wire of the negative pole of the battery was applied; the positive pole attached to a ball, being introduced into the mouth. The jaws were instantly closed, and convulsive movements of the whole body immediately followed. They were not like the shakings of an ague, nor the tremblings of fear, but rather like a succession of startings from surprise: the sight made the spectators shudder.

II. By an incision behind the Sterno-clido-astoides* muscle, Dr. Stevens now laid bare the phrenic nerve of the left side, as it passes over the scalenus muscle, and introduced a blunt probe under it, while Dr. Mott made an opening in the chest, under the cartilage of the 6th rib, with a view to push a metallic plate against some of the branches of the phrenic nerve going to the diaphragm. Some slight spiratory movements followed; but by no means so marked as those described by Dr. Ure. The result which followed another experiment, amply compensated for this partial success.

* The phrenic nerve is much more accessible in this way, than on the inside of the muscle, as proposed by Dr. Ure.

III. One of the supra-orbital and one of the infra-orbital nerves were now exposed; armed and connected with the positive pole, while the negative pole communicated with the wire, connecting the tendons at the heel, as in experiment I.

The countenance was at first considerably distorted; it afterwards assumed a more natural play of expression, varying at each successive application of galvanic influence. The motions of the lips reminded several of the spectators of their expression during life. In this experiment, the wire connected with the negative pole lay on the right arm, near the insertion of the deltoid muscle, and caused considerable motion in the fore arm and fingers.

IV. Communication being established between the brachial plexus and the radial nerves at the wrist, and between the former and the ulnar nerves, the arm, was contracted by a sudden spasmodic action, and the hand grasped firmly the hand of a person who held it: by changing the position of the arm, it was thrown across the table in different directions.

V. The two radial nerves at the wrist being connected, the one with the positive, the other with the negative pole, both arms and hands were contracted, and the deltoid and pectoralis major were much swollen.

VI. In this experiment the positive pole was applied to the spinal marrow by means of a metallic instrument plunged in between the cervical vertebrae; the negative to the heels as in experiment 1st. The results produced by this arrangement were not so striking as those described in experiment 1st. Had this experiment been made at an earlier period, while the sensibility was undiminished, the effects would probably have been more marked.

VII. The anterior crural nerves being now laid bare, as they come out from beneath Ponsart's ligament, were touched with the positive pole; the negative being applied as in experiment 1st. The legs were thrown into strong agitations, and when previously flexed were violently and suddenly extended, performing the operation of kicking.

[At the suggestion of Professor Griscom, the course of experiments prepared by the committee was varied, and the wire of one pole applied to the spinal as in experiment 6th, and the other to a catheter introduced into the urethra. No particular effect was observed.]

VIII. In this experiment the positive pole was applied to the great sympathetic nerve and the par vagum in the neck, and the negative was brought into contact with the branches of these nerves going to the heart. The right auricle contracted distinctly; and slight tremulous motions were observed in the ventricles produced by partial contractions of their muscular fibres.*

IX. The thorax being now open and the heart exposed to view, experiment 5th was repeated, (connecting the radial nerves,) and the results of experiment 8th were observed, but much more

* The right auricle was found distended with blood; the right ventricle comparatively flaccid, supposing that the valves which prevented the return of the blood into the former might not be competent to their functions from the emptiness of the ventricle, Dr. Stevens pressed with his hand the blood from the auricle; it was after this that the ventricle was supposed to contract, but I could not satisfy myself of the fact.

distinctly: the contractions of the right auricle were very evident to all who stood near. Similar results were obtained by applying the pole to the ulnar nerves in place of the radial.

X. Communications between the par vagum in the neck and the left phrenic, that runs on the pericardium, partial contractions of the heart were observed, but much less distinct than in the two preceding experiments.

In varying several of the last experiments, by connecting the positive poles with the nerves and passing the negative over the last 50 plates of the battery, the results seemed to be much more striking, particularly when we consider that the organic sensibility had by this time been much exhausted.*

The lacteals were observed, upon inspecting the intestines, to be beautifully injected;—and part of the intestines which their mesentery were detached and passed round the room, so that many saw that which we rarely have an opportunity of observing, the lacteals of a human subject distended with chyle.

This account of these experiments details merely my personal observations; as far as it goes, it is correct, though I may not have arranged them all in the order in which they took place. I regret very much that I was prevented from taking a more accurate and minute account of their different results, by the number of persons that crowded around the table, prompted by a similar curiosity, and excitement, as well as by some confusion that was necessarily produced by the desire of trying as many different experiments as possible, before it should be too late to perform them with success.

The result of one of these experiments, particularly the 10th, will afford an interesting and useful subject of speculation to the pathologist.

Dr. Ure conceives that no advantage is to be derived from passing electric discharges across the chest. We see, however, that in those cases where the primary object is to excite the heart to action, this single experiment may be of immense benefit, though for most practical purposes it would be necessary to produce simultaneous artificial inflation of the lungs, as congestion in these organs would prevent the successful action of the heart.

The contraction of the heart would also probably ensue, from moistening the parts with a solution of common salt, and pressing the end of the conductors against the ulnar nerves in their course over the elbow, or the radial nerves at the wrist, and thus the heart might be made again to beat, and the whole machinery of the body set in motion, when restoration would be perfectly out of the reach of ordinary means.

A SPECTATOR.

* The experiments occupied from an hour to an hour and a half.

† This agrees with the report of his having made a hearty breakfast a few hours before his execution.

The model of a machine, to propel vessels on the ocean, without either wind or steam, invented by Mr. C. Hoxie, of Hudson, is exhibited at the Tontine Coffee House, New York, for the inspection of the curious, and those disposed to promote useful improvements.—Its object is to convert that tremendous power, the rolling of the sea, into a propelling operation, and nautical men believe in its practicability. Application has been made to Congress to grant the exclusive privilege for 28 years, and the subject is now before the Committee on the Judiciary.—*Philad. Register.*

From the Massachusetts Agricultural Repository.

WHEAT.

Byfield, September 1st, 1823.

TO THE TRUSTEES OF THE MASSACHUSETTS AGRICULTURAL SOCIETY.

This may certify, that I the subscriber, of the town of Newbury, was employed by Mr. Benjamin Savory of Newbury, parish of Byfield to thresh out a quantity of wheat raised by said Savory and clean and measure the same. I was assisted in the work by Rufus Pray, and after cleaning the wheat by passing it through the winnowing mill it measured fifty bushels of clean wheat, over and beside one half bushel of the wheat unhusled or the tailings, so called.—The above wheat was all that was raised by said Savory the present year, was red spring wheat and as I was informed was the Gilman wheat.—I have also attended and saw one bushel of the above wheat measured and carefully weighed, and the weight was fifty-seven pounds and a quarter.

DAVID CLIFFORD.

Byfield, Sept. 1, 1823.

I the subscriber assisted Mr. David Clifford in threshing, cleaning and measuring the wheat raised by Mr. Benjamin Savory in Newbury, parish of Byfield, county of Essex, and it measured when well cleaned, fifty bushels, beside one half bushel of the tailing, so called. I also saw one bushel of the above wheat measured and it weighed fifty-seven pounds and one quarter. I also certify that I have worked with said Savory for the year past, assisted in preparing the ground and sowing the wheat and the above is all that was raised on the farm the present season and was in one lot or patch.

RUFUS PRAY.

Byfield, November 9th, 1823.

I the subscriber of Newbury, county of Essex, and parish of Byfield, do hereby certify that I sowed a piece of wheat in April last, and the ground was cultivated the year previous in manner following, viz.: it was broke up in the fall of 1821; in the spring of 1822, it was ploughed, well harrowed and planted with potatoes and a large shovel full of manure put in each hill, it yielded a good crop, and in the fall of 1822, after the crop was taken off it was ploughed twice, then harrowed fine and laid in high ridges through the winter, in the spring of 1823, before the frost was entirely out, the ridges were split by ploughing, then cross ploughed very deep, quite to the plough beam, and well harrowed, after which thirty cart loads of good stable and hog manure was spread on the ground and ploughed in deep, it was then well harrowed and four bushels and three quarters of well washed wheat which had been soaked four days in strong pickle, sowed broadcast, ploughed in with a small seed plough, bush harrowed and rolled with a heavy land roller, it came up well, and grew well through the season, and hardly a single blade blighted, smutty or rusty could be found in the piece, when threshed and cleaned it measured fifty bushels of well cleaned sound wheat, and there remained one heaped half bushel of wheat not husled, the tailings, so called, it weighed fifty-seven and one quarter pounds per bushel, and a sample accompanies the certificates, the soil was a deep yellow loam on a hard pan mixed with clay.

BENJ. SAVORY.

Essex, ss.

November 17th, 1823.

Personally appeared David Clifford and Rufus Pray, and made solemn oath to the foregoing statement which they have each of them subscribed respecting the wheat raised by Mr. Benjamin Savory of Byfield parish, town of Newbury.

I would also state that the above named persons, I have known for a number of years. I think them steady, well behaved men and entitled to credit it.

DANIEL HALE, Justice Peace.

November 17th, 1823.

This day surveyed for Mr. Benjamin Savory, the land where the aforementioned wheat grew which contained one acre and one hundred and forty-six rods.

JOHN NORTEND.

Essex, ss.

November 17th, 1823.

Personally appeared the above named John Northend, and made solemn oath to the statement above made by him, respecting the measurement of the land on which Mr. Savory's wheat grew, before me.

DANIEL HALE, Justice Peace.

Essex, ss.

November 18th, 1823.

Personally appeared, Benjamin Savory, above named, and made solemn oath, that his statement, respecting ploughing the ground, sowing and raising the above mentioned wheat, is a correct statement, before me.

DANIEL HALE, Justice Peace.

From the Bellows Falls Intelligencer.

It is a very obvious fact, that our agriculture is in a languishing state, and that the husbandman by no means receives the due reward of his labours.

The raising of beef and pork was formerly a very profitable employment for the farmers of New-England; but a change of times calls for a change of pursuits. There is no longer a sufficient demand either at home or abroad, for our staple products; and they are, of course, sold at prices altogether inadequate to the expense of raising them.

We export large quantities of beef and pork, and import large quantities of wool. Two millions of pounds were imported last year, in the raw material, besides what was manufactured. Now, would it not be much better for us to raise our wool, and save the trouble, expense, and risk of two transportations?

A calculation which any farmer can make will set this business in its true light. If you sell your neat stock at two years old, they produce you about ten dollars per head. Now, suppose you have fifteen head given you in the fall after they are a year old, when they may be considered as half raised for market. To keep them through the winter, you will need at least ten tons of hay; and to fatten them in the summer, you will need between thirty and forty acres of good pasture. In the fall you send them to Boston market, and get ten dollars per head, or \$150 for the whole. Now your ten tons of hay will winter one hundred Merino sheep, and thirty or forty acres of pasture will keep them through the summer. They will yield you about three pounds of wool per head, which, estimated at fifty cents per pound, will produce \$150 for the

whole flock; and the increase of the flock will at least amount to fifty dollars more; so that the actual produce of your flock will be \$200; that is, fifty dollars more than your beef would fetch, if your cattle were given you half raised.

The price of wool cannot be said to be fixed too high, when it is known that some of the best lots of the last crop actually sold for seventy-five cents per pound.

I do not make these statements to induce every body to forsake the raising of neat stock, and rush heedlessly into the raising of sheep. Such changes, I know, ought to be made with caution; but I think the good of the country, evidently require less beef and more wool.

Our manufactories are multiplying; the increase of manufactories will increase the home demand for our beef and pork, butter and cheese, grain and other produce—the raising of grain will be profitable for those who have farms suited to it, and have a plenty of help. Those who have grazing farms, will doubtless find a dairy profitable; and as the attention of the country is turned more to sheep, the profits of the dairy will increase. But those who have large farms and little help, will find the greatest profit in sheep; for the produce of the flock is gathered with very little expense.

A FARMER.

LUCERNE,

ITS VALUE AND MODE OF CULTURE.

[We have long been persuaded, that the public are not generally sensible of the great value of Lucerne, in comparison with other grasses, for green food, especially in hot and dry seasons, and we are the more gratified in the opportunity of copying the following communication, to the Philadelphia Agricultural Society, founded, as it purports to be, on the experience of ten years. The seed may, we perceive, be now had, of Mr. Robert Sinclair, at 50 cents per pound.]—Ed. Am. Farmer.

TO THE PHILADELPHIA SOCIETY FOR THE PROMOTION OF AGRICULTURE.

Perth Amboy, 10th July, 1823.

Having been for ten or twelve years past in the successful practice of cultivating lucerne, I think it may beneficially promote the interest of Agriculture, to offer you a few remarks on that subject.

This article, (frequently denominated French Clover,) I have found by experience, to be not only the most convenient, but also the most profitable of all grasses. It vegetates quicker in the spring than any other grass, it resists the effect of droughts, it may be cut four or five times during the season, and it will endure from 10 to 12 years without renewing. Of all other grasses it is the most profitable for soiling. I am fully of opinion, that one acre properly got in would be more than sufficient to maintain at least 6 head of cattle from the first of May, until the frosts set in, for before it can be cut down in this way, the first part of it again will be ready for the scythe. English writers have recommended the drill system for this grass, but in this climate I have found this plan not to answer.

The proper mode is to put the land in good order; to sow it broadcast, and to get the seed in during the month of April, or the early part of May. Fall sowing will not answer, as when sowed so late, it, like clover, is found not to re-

ist the effects of the frosts. It may be got in with spring rye, or barley, or with oats, but in the last case, the oats would require to be cut near and before getting into seed, and by these means, an early feed for cattle would be obtained without impoverishing the soil. But the mode I would most confidently recommend, would be to sow with the lucerne, about half a bushel of common (winter) rye to the acre.—The effect of this is, that the rye, which vegetates quickly, serves as a nurse to the young grass, against the effects of the scorching sun, and by the time the grass attains sufficient strength to protect itself, the rye withers and apparently dies. It will however again come forth in the spring, and mixed with the lucerne, will add much to the quantity of fodder, and prove a most excellent feed for cattle. The rye will admit of being cut green in this way, before getting into seed, two or three times with the lucerne, before it decays. The quantity of seed I recommend, is at the rate of 15 to 20 pounds to the acre.

The kind of soil most suitable for this culture is a dry mellow land—but a sandy or clay soil will also answer, provided they are wet. In a favorable season, the lucerne may be cut the ensuing fall—after the first season you may generally begin to cut it green for cattle by the end of May, which saves the young pasture, and is in every respect a great convenience, as all kinds of animals devour it with equal avidity. It produces a great quantity of seed, and is much more easily obtained than clover. The second and third crops are the most productive of seed.

JOHN PATRICK.

From the Boston Palladium.

Portable Volcanic self-generating Gas and Steam Engine.

A young gentleman of this city, after twelve months study and experiments, has accomplished that great desideratum the unexceptionable application of an elastic power, to the propelling of land carriages. We have been favored with the sight of this Engine in operation, and from the novel, scientific and economical principles upon which it is founded, we cannot doubt of its complete success.

From the confidence that has been placed in it, we cannot here explain its principles, it being the intention of the inventor not to make them known to the public, until they are demonstrated in actual operation on a carriage, but we will venture a general view of its advantages over the thing of the kind heretofore invented for land and all other purposes, where steam engines have been used.

A ten horse power Engine may now be made to weigh from one to two hundred pounds occupying the space of a child, at the prime cost of \$50, and working at an expense proportionably advantageous. In fact, it seems to combine the most of the greatest power, with perfect safety, the least possible space and weight. The inventor has several different methods of generating his power and caloric, applicable to the same Engine. Some of them offered all their supplies without any attendance whatever. We have seen a letter from London, stating that this engine had been secured, three months since, in six different States in Europe.

FULTON.

From the New Hampshire Patriot.

AGRICULTURAL.

The following observations of a Vermont farmer, show that we should consult our real interest, as well as the finer feelings of our nature, by defending the innocent robin from the attacks of both boys and men. There are also other kinds of birds who prey on the insects which devour our crops, and whose industry would amply reward us for protecting them.

"I know of no method whatever to extirpate this larger species, which human ingenuity can devise. But Providence seems to have provided an antidote to this evil in the *rubicula*, or common robin. This innocent and useful bird preys with peculiar avidity upon this species of worm. This fact may be ascertained by visiting a nest of young robins in the vicinity of a corn field, when it will be perceived that they are fed lavishly upon this kind of worm. At other times, this bird feeds upon different species of worms and bugs, which are found upon the surface of the ground, which services are of immense value and benefit to the farmer, and ought to recommend it to his peculiar care and patronage. But its innocence and utility are inadequate to protect it from the wanton cruelty of boys and sportsmen. What immense number of these our benefactors are annually destroyed through mere wantonness and cruelty, while we are constantly hearing of the ravages of worms and bugs, in the various departments of vegetation. Even whole corn fields have been laid waste the present season by this larger species of worm, which calamity might have been obviated by having spared and fostered the robin. The utility, in fact, of this invaluable bird, is so obvious, that even legislative interference is imperiously demanded, to rescue it from the bloody fangs of the fowler."

London Vaccine Institution.—On Thursday, the Governor and Members of this Institution met at the City of London Tavern, for the purpose of receiving the Annual Report.—The Chairman said, in addressing the meeting that the Report would give great satisfaction to the friends of humanity, although the prejudice in favor of the small pox still continued to be the means, unfortunately, of sacrificing lives of thousands.—Dr. Walker, the indefatigable and zealous advocate of the Jennerian system read the Report. It stated that the benefits of vaccination were diffused to the inhabitants of every land, but in this metropolis, the *fomites* of the small pox still lurked amongst the ignorant and prejudiced part of the population—744 persons fell victims to that dreadful disease in the course of the last year, within the bills of mortality, and the deaths of many are not included in those annual registers of departure from life. The managers continued to watch the departure of vessels to foreign nations as well as to all the British colonies, and continued to afford supplies of the vaccine ichor for the protection of the colonies from the small pox.—*London paper.*

NEW ENGLAND FARMER.

SATURDAY, APRIL 17, 1824.

FARMER'S CALENDAR.

SOWING GRASS SEEDS. A diversity of opinion exists respecting the most eligible time in the year for sowing clover and other grass seeds. Some prefer the fall, but the majority of those who have written on the subject recommend sowing in the spring; and the latter method, so far as our acquaintance extends, is the most generally practised. European writers direct, even when grass seed is sowed on the same ground with winter grain, to sow the grass seed in the spring, and *harrow it in*. They say that the harrowing will, on the whole, be of service to the grain, though a few of the plants may be torn up by the process. The Hon. Richard Peters likewise says, "harrow your winter grain in the spring, in the direction of the seed furrows, or drills, and be not afraid of disturbing a few plants; manifold produce will remunerate for the destroyed."*

The Farmer's Assistant says, "Clover may be sown with barley, oats, or spring wheat, when that article is raised; or it may be sown with winter wheat in the fall, if the land be dry, and warmly exposed; or in the spring, when it should be lightly brushed or harrowed in." The Domestic Encyclopedia asserts that "experienced farmers generally prefer sowing clover with wheat rather than with barley or oats as in dry seasons the clover frequently overpowers the oats or barley, and if it be sown late in order to obviate this evil, it often fails, and the crop is lost for that season. Probably the diversity of opinion with respect to the proper time of sowing clover seed, may arise from the difference in the nature of the soils on which trials have been made. An experienced agriculturist (Edward Duffield, Esq. of Philadelphia county,) assures Dr. Mease that he repeatedly failed in obtaining a crop when he sowed his clover in the autumn or winter; and he is uniformly successful when he sows in the spring. His soil is a light loam."

The reason why clover sown in autumn is apt to fail is probably this. The young plants, which came up in the fall, cannot bear the frost so well as those which have had a whole summer to bring them near to maturity.

There is likewise a great difference of opinion as regards the quantity of seed to be sown when land is to be laid down to grass. Sir John Sinclair says, "it is a great error, in laying down land to grass, to sow an insufficient quantity of small seeds. In general, 12 or 14 lbs. of clover is the usual average allowance.—But that quantity, it is contended, ought greatly to be increased, and in many cases doubled. In several instances, land has been laid down with ten pounds of red clover, ten of white, and ten of trefoil, or 30 lbs. in all, of small seeds, with the addition of three pecks of rye-grass, per statute acre, and the herbage proved most abundant." This seems to confirm the doctrine already laid down respecting a liberal allowance of seed, when land is laid down to grass, more especially for any length of time. The plants, however abundant at first, will die off to a proper standard as they become older."

* Notices to a Young Farmer.

The Farmer's Manual directs to sow red clover, on land designed for tillage, separately without herd's grass [timothy] or other mixture, 4 or 5 quarts to the acre."

The Farmer's Assistant tells us that "the quantity of red-clover seed to be sown to the acre is about fourteen pounds, and none but clean seed ought to be sown."

The "Memoirs of the Board of Agriculture of the State of New York," vol. ii. in giving an account of the Methods of Culture adopted by the farmers of Rensselaer, in that State, observe that "the red clover, (*trifolium pratense*), and the timothy grass (*phleum pratense*), are mixed in different proportions, and sowed in the spring season. When they are sowed on winter grain, most farmers prefer sowing them on a light snow which may happen to fall towards the latter part of March or the first of April; or in damp, calm, misty weather, if no suitable snows fall. If they are to be sowed on spring-sowed crops, the most approved season is, while the soil is yet loose, before any rain has fallen.

"Farmers differ in opinion in regard to the most suitable quantity of seed. S. Germond, H. Worthington, C. Porter, C. R. Colden, and some others, say that eight quarts of the mixture of clover and timothy seed should be sowed on every acre. And Col. J. Carpenter sows sixteen quarts on an acre. He says when the grass and clover grow very thick, it will be more tender feed, and more fine hay, and that it will not run out so soon. But J. Phillips, G. Eddy, and many others, consider four quarts as sufficient.

"All agree that the proportions of the mixture of the seeds should be governed by the nature of the soil. That in a sandy soil three-fourths of the seed should be clover—in clay it should be equal parts—in clay soil but one fourth clover seed.

"There should be at least a bushel of plaster sowed on every acre of clover and grass land of a sandy, gravelly, or loamy soil. Also, on all upland natural meadows. Two bushels per acre are much better than one on sandy or gravelly soil.

Fayson Williams, Esq. of Fitchburgh, Mass. who received a premium from the Massachusetts Agricultural Society for the greatest quantity of spring wheat, raised by him in the summer of 1822, in giving a description of the mode of culture, by him adopted, says, "the quantity of grass seed used by me is never less than twelve pounds of clover, and one peck of herd's grass [timothy] to the acre. I here permit me to observe that innumerable are the instances in this country, where the farmer fails in his grass crops, by not allowing seed enough: and what is worse, the little he does give with a sparing hand is suffered to take its chance under that pest of agriculture called the bush-barren, which not only drags stones and other loose matters into heaps, but leaves the soil dead and heavy, and does not cover the seed deep enough to strive with our July drought effectually."—Col. Valentine, President of the Society of Middlesex Husbandmen and Manufacturers, sowed with his premium crop of spring wheat, raised the last season, twelve pounds of clover and half a bushel of herd's grass seed.

We have, however, been verbally assured by very correct and scientific agriculturists, that 6 or 7 pounds of clover seed, where the ground is highly manured, is quite sufficient; and that

by exceeding that quantity the plants so shade and stifle each other that there is little substance in the hay made from them. No doubt much depends on the quality and richness of the soil. The poorer the soil the greater quantity of grass seed should be sown. Clover seed of a bright yellow, with a good quantity of the purple and brown colored seed among it (which shows the maturity of the seed) should be preferred.

PEAS. Field peas should generally be sowed as early in the spring as the ground can be got into proper order. The last week in April, or the first week in May will do very well, but if the soil is a light sandy loam, which is recommended for that crop, they may usually be sowed still earlier to good advantage. But when it is feared that they may be infested by bugs it will be safest to sow them as late as the 10th of June. Col. Worthington, of Rensselaer County, New York, sowed his peas on the 10th of June six years in succession, and a bug has never been seen in his peas. Whereas, his neighbors, who have not adopted this practice, have scarcely a pea without a bug in it. He supposes the season for depositing the egg of the pea bug is passed before the peas are in flower. Mr. Pickering likewise expressed an opinion that the bug may be avoided by late sowing, but the hot sun in June will so pinch the late sown peas that the crop will be small unless the land be moist as well as rich."

The quantity of seed, when sowed broad cast is from a bushel and a half to three bushels to the acre. Deane's New England Farmer says, "Our farmers do not commonly allow a sufficient quantity of seed for peas in broad cast sowing. When peas are sowed thin, the plants will lie upon the ground, and perhaps rot: when they are thick the plants hold each other up, with their tendrils forming a complete web; and will have more benefit of the air." Three bushels to the acre are recommended by Dr. Deane.

In our paper, volume i. page 279, we gave some observations on the raising of early peas, which we shall not repeat, but merely add the following intimation from the Domestic Encyclopedia. "It is a great error in those persons who sow the rows of tall growing peas close together. It is much better in all those sorts which grow six or eight feet high to have only one row, and then leave a bed ten or twelve feet wide for onions, carrots, parsnips, or any crops which do not grow tall.

"The advantages which will be derived are, that the peas will not be drawn up so much; be stronger; will flower much nearer the ground, and in wet weather can be more easily gathered without wetting yourself."

Peas are sowed in drills, in field cultivation in this vicinity with success. The distance of the rows, and the distance which the peas stand from each other in the rows, depend on the kind of peas sown, and the nature of the soil.—Dwarf peas, on a poor soil should be nearer together than those which grow tall, and are set upon a rich soil. Drilled peas, are hoed two or three times, should be earthed up a little

and kept free from weeds. Dr. Anderson says that lime is the best manure for land, which is intended to be sown with peas.

It has been practised by some to sow peas for the purpose of feeding hogs without the trouble of harvesting the crop. As soon as the pods fill the hogs are turned in to fatten, and what they do not consume is ploughed in as soon as the hogs have left the field.

AGRICULTURAL INSTITUTION. In the advertising department of this day's paper will be found a Prospectus of a Seminary about to be instituted at Derby, Conn which affords a fair prospect of being very useful to the public, as well as beneficial to the individuals, who may have opportunities to avail themselves of the advantages, which it proffers. Literature and Science have hitherto been too much busied in mere matters of speculation, and the investigation of abstract principles, foreign to all practical purposes of life. The sages of our schools have, too generally, appeared to entertain opinions similar to those which Plutarch attributed to Archimedes, who considered "every art, which ministers to common uses, as mean and sordid, and placed his whole delight in those intellectual speculations which, without any relation to the necessities of life have an intrinsic excellence, arising from truth and demonstration only."

The era, however, is approaching, if it has not already arrived, when mental endowments will be estimated by the test of utility; and that kind of knowledge will be the most eagerly sought after, as well as most efficiently and liberally patronized, which will enable its possessor to bestow the greatest benefits on his species—when science will be valued in proportion to its power to minister to the necessities and add to the comforts of individuals, as well as to increase the resources, and moral and physical strength of a nation.

We have reason to believe that the instructors of the proposed Seminary to which it is the object of this article to invite the attention of our readers are well qualified for the duties they have undertaken and we hope the institution over which they are about to preside will prove as prosperous as its objects are laudable.

FINE CIDER. John Kenrick, Esq. of Newton, Mass. has presented us with a sample of some very excellent cider of his own manufacturing. We do not recollect ever to have tasted cider of a better quality and would recommend it to all ladies and gentlemen, who possess true taste and genuine patriotism, as more palatable and more wholesome than the fiery fruit of the distillery, or the dear bought and far fetched products of foreign vineyards and drug-shops. We understand that Mr. Kenrick has a quantity of his superlative cider for sale at his residence in Newton.

The Milton (N. C.) Gazette furnishes a curious account of a spontaneous combustion, which recently took place in that neighborhood. It occurred in a parcel of hops, which, after being well dried, were put into a home spun cotton gown, moderately pressed in, and placed on a heap of cotton seed. No fire or even candle had been, it is said, for three months in the room in which they lay. Cotton has been frequently known to take fire spontaneously in a moist and heated atmosphere. The problem in the present case is what peculiar property of the hops produced the combustion?—National Intelligencer.

ST. LOUIS, MARCH 8. Thirty eight hogheads of Missouri Tobacco, with the stamp of "Bingham & Lamb, Boon's Lick, Missouri," were sold in the city of New York some time in January, at the highest price,

* Memoirs of the Board of Agriculture of the State of New York, vol. ii. p. 23.

† See a letter from the Hon. Timothy Pickering to John Lowell, Esq. published in the Massachusetts Agricultural Repository for June, 1822.

ing pronounced superior to any other description of tobacco in the market. Missouri tobacco always bears the highest price in New Orleans, and has frequently preference in Philadelphia and Baltimore. What will they say when they see our hemp? We would not be surprised to hear exclaim that Russia had been acting an imposition on the world, when they come to examine the hemp of Missouri.

Murder.—On the 11th inst. a man by the name of Paul French, of Fitchburg, Mass. was committed to jailer George Gault, charged with having murdered Abel French, 2d, of the same place. It appears that the prisoner found his wife from whom he had been sometime separated, and the deceased, who was his cousin, asleep together in the house of the latter. The prisoner assaulted his wife, and attempted to cut her throat, but struck so high that her jaw received the blow. He then stabbed her several times. His cousin attempting to defend the woman was stabbed by the prisoner and expired immediately. The wife of the culprit though badly wounded, is expected to recover.

CONGRESSIONAL.

SENATE.—Friday, April 2. The Navy Appropriation Bill from the House was reported by Mr. Lloyd, of the Naval Committee of the Senate, with various amendments; which, after being explained by Mr. Lloyd, were concurred in by the Senate. One was to take out the clause by which the appropriation for the purchase of a small strip of land near the Navy Yard, in Charlestown, for the purpose of erecting a wall and the yard.

Saturday, April 5. The bill on the subject of abolishing imprisonment for debt was discussed, and a motion added, that nothing in the bill shall extend to suits brought to recover money received by the defendant on account of the United States. It was amended so as to provide that no person shall be held in prison on mesne process, except in the State where the parties reside, or in which the debt was contracted, unless the debtor has absconded from the State in which he resided. Ayes 28, Nays 11.

Sunday, April 6. The bill to abolish imprisonment for debt was resumed, debated and advanced some.

The bill making appropriations for the naval service was discussed, and Mr. Lloyd, of Mass. moved that the Senate should concur in the amendment proposed by the House, requiring the consent of the Commonwealth of Massachusetts to the purchase of a strip of land, adjacent to the Navy Yard at Charlestown, in that State, which motion was carried. Mr. Lloyd then moved that the Senate should insist on its amendment, by which the several specifications of the contingent expenses of the Navy Department were struck out, and the sum inserted in gross; in which the same item was increased from \$200,000 to \$225,000. After some remarks on this point, the motion prevailed, and the Senate determined to insist on this amendment.

Monday, April 7. The bill to allow a draw back on foreign goods, manufactured of foreign hemp was considered, and after discussion, made the order of the day for Monday next.

Tuesday, April 8. The New Tariff was discussed, and Mr. Lloyd spoke on its different items, but his observations cannot be given at large in our paper, and attempting to abridge them would be doing injustice to the able orator. Mr. S. Ward followed in support of the bill; and Mr. Garnett, and Mr. Williams, of Mass. were against it.

Wednesday, April 3. The bill to confirm certain provisions of Gov. Miller, passed, and after attending to other local bills the Tariff Bill became the order of debate, and when the Committee rose the President ordered the bill and its amendments to be read.

Thursday, April 5. The Navy Appropriation Bill was discussed, and the purchase of a small piece of land near the Navy Yard, in Charlestown, agreed to on condition that the consent of the Commonwealth of Massachusetts be first obtained. The House, in Committee, concurred in the amendments proposed by the Senate in increasing the appropriation for contingent expenses from \$180,000 to \$225,000.

The Tariff Bill was again discussed but nothing decisive adopted.

Tuesday, April 6. Mr. Randolph gave notice that he should call up his motion for the reduction of the compensation of the Members on Saturday next.

Mr. Warfield offered a resolution requesting the President of the United States to submit a statement relative to the purchasers of real estate in behalf of the United States, &c.

Mr. Allen's motion to fix on the time for a recess of Congress was ordered to lie on the table, 93 to 68.

The Tariff Bill was again discussed, and a motion of Mr. Webster for altering the rate of duties on certain foreign wines was agreed to. Ayes 110.

A number of other motions on the subject were brought forward, and negatived.

The Committee rose and reported the bill as amended.

Wednesday, April 7. The House having voted to insist on their disagreement to the amendment of the Senate, relative to appropriations for the Navy, agreed to a conference, and a committee of five were appointed on behalf of the Senate.

Mr. Forsyth withdrew the intimation to move the indefinite postponement of the Tariff Bill, until the question had been settled as to the amount of duties on articles of wool, cotton, and iron.

The question on the amendment to reduce the minimum on wools from 30 to 40 cents was decided in the affirmative. Ayes 101, Nays 99.

Thursday, April 8. The vote to reduce the minimum on wools from 30 to 40 cents was reconsidered and the minimum valuation remains as before at 30 cts.

AGRICULTURAL SEMINARY.

JOSIAH HOLBROOK & TRUMAN COE, will open in Derby, Conn. on the 2d Wednesday of May next, a LITERARY, SCIENTIFIC, and PRACTICAL INSTITUTION.

The exercises they design to introduce, are the study of the Latin, Greek, French, and English Languages; Rhetoric, Elocution, Geography, and History. The Mathematics—as Arithmetic, Algebra, Geometry, Plain and Spherical Trigonometry, Mensuration and Fluxions. Natural Philosophy in its various branches.—Astronomy, Chemistry, Mineralogy, Botany, and Zoology.

No efforts will be spared, to render these sciences Practical and fitted to *Common Life*.—With that view, particular attention will be given to Composition, Declamation, written and extemporaneous Debates, the Uses of Arithmetic, and the higher branches of Mathematics in common business, Practical Surveying, the application of Natural Philosophy to various kinds of Machinery, Agricultural Instruments, &c. testing the principles of Chemical Science in mixing and preparing Soils, forming Manures, making Cider, Beer, Spirits, and various other articles of Agriculture and Domestic Economy—Agricultural, Geological and Botanical excursions into various parts of the country, examining and analyzing soils,—and *Practical Agriculture*.

Upon most of the sciences abovementioned, Lectures will be given, attended with familiar illustrations. Arithmetic and the higher branches of Mathematics, will be conducted by a course of demonstrations, intended to show their nature and uses.

There will be given annually, in the winter, a course of Lectures on Agriculture, bringing to view those modes of Farming, which *Experience* has proved to be best fitted to different soils, climates, exposures, &c. at the same time, explaining, as far as may be, the principles of science on which such practice is founded. This course will be designed as well for those farmers, whose leisure, in that season of the year will permit them to attend, as the regular members of the Seminary.

It cannot be doubted that if the course here proposed should be extensively adopted, it would effect a great desideratum in the Education of this country, viz. uniting Theory and Practice, and thus training up youths to be both practical and scientific men, and by that means prepare the way for the advancement of the Useful Arts, particularly Agriculture; and, by instituting an agreeable variety in their exercises, it is believed they may be kept almost constantly engaged, in a manner which will be both interesting and useful, and calculated to give them firm and healthy constitutions, and habits of systematic industry and morality.

The Institution is provided with Land, necessary Buildings, Philosophical and Chemical Apparatus, and a Cabinet of Minerals, and it is intended, as soon as practicable, to furnish an opportunity for youths to defray or lessen the expenses of their Education, by their own industry.

Active measures have been taken to collect all the improved methods of Education, both in this country and Europe and every endeavor will be used to adopt such a System of Instruction and Government as will recommend itself, in a particular manner, to those who design to be teachers.

There will be two terms in the year, one commencing on the 2d Wednesday in May, the other the 2d Wednesday in November. Students not taken for a less term than six months—they will not all be required, however, to go through the same course, but may be under the instruction of such teachers, and attend to such studies, as will fit them for the course of life they design to pursue.

Board from \$1, 50 to \$2 per week.
Tuition Thirty Dollars a year. Courses of Lectures on Chemistry, Natural Philosophy, Mineralogy, and Botany, Three Dollars each—which courses will commence at the opening of the Seminary.
Specimens in Mineralogy, Botany, or Zoology, also, Communications, particularly from Farmers and Mechanics, directed to the Agricultural Seminary, at Derby, Conn. will be gratefully received.
Derby, Conn. March 24, 1824.

NOTICE.

MR. HALL J. KELLEY, Engineer and Teacher of Mathematics, will be in his Office, No. 64, Market-Street, between the hours of 12 and 2 o'clock, P. M. April 17.

A MOTHER'S LOVE.

BY MRS. HEMANS.

There is none,

In all this cold and hollow world, no fount
Of deep, strong, deathless love, save that within
A mother's heart. It is but pride, wherewith
To his fair son the father's eye doth turn,
Watching his growth. Aye on the boy he looks
The bright glad creature springing in his path,
But as the heir of his great name, the young
And stately tree, whose rising strength ere long
Shall bear the trophies well. And this is love!
—This is *man's* love!—What marvel?—You ne'er
made

You breast the pillow of his infancy,
While to the fullness of your heart's glad heavings
His fair cheek rose and fell: and his bright hair
Waved softly to your breath!—You ne'er kept watch
Beside him, till the last pale star had set,
And morn, all dazling, as in triumph broke
On your dim weary eye; not yours the face,
Which, early faded through fond care for him,
Hung o'er his sleep, and, duly as Heaven's light,
Was there to greet his wakening! You ne'er smooth'd
His couch, his last sung him to his rosy rest,
Caught his last whisper when his voice from yours
Had learn'd soft utterance; hush'd his wayward cries
With patient, vigilant, never-wearied love;
No! these are *woman's* tasks!—In these her youth
And bloom of cheek, and buoyancy of heart,
Steal from her—all unmark'd!

Miscellany.

GLEANINGS FROM LONDON PAPERS.

Animal Instinct.—Early on Friday morning, a gentleman residing with his family, at No. 1, Gothic-Place, in the Montpelier-walk, Cheltenham, was roused by the continued barking of a small spaniel, that had posted itself at his chamber door, and could not be silenced until he opened the door, and was then first alarmed by a smell as if of something burning. On making down stairs it was found that the furniture in the sitting rooms was nearly all consumed. A female servant, who slept at the top of the house, fearing the flames might prevent her descending by the stairs, opened the window, and getting upon the top of the veranda, she leaped down to the ground, a considerable distance. Having thus escaped, on hearing that her lady's reticule, containing a large sum of money, a watch, &c. was not secured, she intrepidly run up stairs, and saved the property. The fire by this time ascending she was obliged again to descend by the window, which she affected in safety.

Hatching Chickens, &c. by Steam.—The new process of hatching by steam has been carried into effect; and the inventor advertises to hatch and rear domestic poultry and game birds on certain terms, by the dozen or score, perhaps, or to receive one half of the produce.

We understand that a lady of quality, dowager to a distinguished statesman, lately deceased, has sent some eggs of the ostrich to be hatched by the newly invented steam process. It is a well known fact in natural history that this bird does not set on its eggs, but that they are deposited in the sand, where the warmth of the sun produces the same effect as the incubation

of the parent bird. As ostrich feathers are a costly article of commerce, and of fashionable consumption, this process, if successful, will greatly diminish their value. The difficulty of preserving the exact temperature, and of rearing the young ones, when brought to life, will, however, present obstacles not easily surmountable. The eggs are new ones, having been produced by a male and female ostrich, the property of the lady who has supplied them for the experiment.

Wild People.—There is a description of wild people in the interior of the Palembang dominions, in Hindostan, who refuse all intercourse with civilized society, and are called Orang Kuba. They are considered a very harmless inoffensive people, and with them a trade is contrived to be carried on in the following manner. Clothes, tobacco, and other articles of which they have need, are placed at certain spots near where they are known to live; and the owner of the goods, as a signal to them, beats a gong when he retires from the place.—These people then come and take away the goods, leaving a very full equivalent in honey, wax, and other articles they collect in their wild retreats.

We learn that a gentleman is now completing a patent for making Gas from new ingredients, which he has discovered, and which can be procured cheaper than oil, and produce a much more brilliant and transparent light than coal or oil gas, without any noxious or dangerous effects in its manufacture or use. He recommends coal gas to be burnt in the streets, and the new gas in doors, for its effects are as pleasant as wax lights to the sight and smell, and of course not at all injurious to furniture or goods.

Cheap Wine.—The following is said to be a chemical analysis of a bottle of a cheap commodity, sold under the denomination of Port Wine, viz.:

Spirits of wine 3 ounces;
Cider, fourteen ounces;
Sugar, one ounce and a half;
Alum, two scruples;
Tartaric acid, one scruple;
Strong decoction of logwood, 4 ounces.

Attacks on Agricultural Machinery.—We are sorry to find by a letter from Halesworth, in Suffolk, that the laborers have been doing mischief to some of their employers, who choose to use threshing machines, and other improved implements. In one instance they cut a draining plough to pieces; and, but for the timely arrival of the parish officers, they would have destroyed a threshing machine.

On Friday Se'nnight, Mr. Hancock, of Tregondale, lost two fine rams in the following manner:—The rams were coupled together by a chain round their necks, and turned out to graze in a field with a colt a little more than twelve months old. In the morning as Mr. Hancock went round to view his flock, he found the rams suspended by the chain across the back of the colt, quite dead. The colt it is supposed had laid down, and the rams in grazing passed the chain across him, when rising suddenly he must have taken them up with him. The colt was little injured, except exhaustion by fatigue.

Agricultural Implements.

FOR sale at the AGRICULTURAL ESTABLISHMENT No. 20, Merchants' Row, a great variety of and useful FARMING and GARDEN TOOLS, and which are the following, viz.:

Nixon's Patent Cast Iron Plough; Tice's do.; ver and Fay's do.; Wood's and Freebone's do.; Ford's Cast and Wrought Iron do.; do. Wrought do. Double Mould Board and Expanding do.; Snel Side Hill Plough; Beaton's Improved Scarifiers Cultivators; Harrison's and James' Patent Corn E lers; Jaquith's Threshing Machine; Willis' Pe Straw and Hay Cutter, the most improved and best structured machine for the purpose ever invented. Of the above Machines is now in use and may be seen Niles' Livery Stable, Hawley Place.—Also, Saff Patent Straw Cutters; Hand Straw Cutters; Broad Cast Machine for Grass and other Seed; and Turnip Drills; Steven's Patent Steel Spring and Manure Forks; Brade & Co's. Cast Steel Wright's Steel Plated do.; Common and Narrow Merrill's Steel Crook Neck do.; Iron and Steel toe do.; Turnip and small Garden do. of all k Garden and Pruning Shears; Transplanting Tr and Forks; English and American Shovels and Sp Bisslee's polished Cast Steel Back Strapped Sho new and very superior article; Can's Cast Steel Sc Brush and other Scythes; Common and Iron Garden Rakes, together with many other va Tools.—Also, a New Improved Tree Brush for dest Caterpillars.

A liberal discount made to dealers in the articles.

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has received per London Packet, and for sale, a teusire variety of Agricultural and Horticultural which added to his former collection makes the est assortment in New England—among them bushels early and late Peas, of various sorts; 1 Turnip, 100 lbs. RUTA BAGA, 260 lbs. Carre lbs. Beet, 100 lbs. MANGEL WURTZEL, Cabbages of sorts, Cauliflowers, 100 lbs. Radish c Lettuce of sorts, Endive, Kail, Celery, SALS SCORZENERA, Onion, Leek, Sweet Mai Thyme, Sage, summer and winter Savory, Lav sweet Basil, Chervil, Fennell, Burnet, Grass viz. Herds, red and white Clover, Foul Meado Top—with a large collection of ORNAME SEEDS.

Garden Tools, viz. Pruning and Budding Pruning Saws, Pruning Shears, Garden Reels and transplanting Trowels, Rakes, Dutch or Pushing Edging Irons.

Gooseberry and Currant Bushes, Honeysuckle den Roses, &c. 1200 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety stantly for sale, such as Roses, Myrtles, Ger Agapanthus, Orange Trees in fruit and blossom Multiflora or Garland Rose, Mountain Daisies, 1 times, &c. 50,000 THORNS or QUICKS f fences.

ENGLISH CHEESE, and fine ENGLISH PEAS.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of F Wurtzel Seed, raised by John Kenrick, Esq. ton.

TERMS OF THE FARMER.

No. 39

CORRESPONDENCE.

To the Editor of the New England Farmer,

SIR,—Being at the Shaker Village, in Canterbury, N. H. last fall, Mr. Winkley showed me a very large and handsome pair of *late calves*, which he told me intended to keep up to hay, and not turn them to grass. All this spring, thinking they would winter better, he sent me, (at my request) with their method of raising calves—with liberty of transmitting a copy to you for publication. It was a month after the letter was dated before I received it, or I should have favored you with a copy sooner.

LEVI BARTLETT.

Warner, N. H. April 13, 1824.

Canterbury, March 9th, 1824.

RESPECTED FRIEND.—I just received your letter of the 26th ult. requesting information respecting the course we take in raising calves. Although willing at all times, to communicate any thing to our fellow citizens, that would be beneficial to them in any respect, yet we are far from claiming any superior knowledge on this subject. However, in compliance with your request, we give you the following, which has been our general mode of treatment for many years. We let calves that came in the fore part of March, suck about a week or ten days, then take them from the cow, giving them a moderate allowance of new milk to drink till they have learnt to drink it freely; then put in some skimmed milk; and we feed them wholly with skimmed milk, taking care to give it at about the temperature of milk directly taken from the cow; by heating a part of it, and mixing it with the rest. Care should be taken not to scald the milk when heated; also not to give them any raw milk, for this will make them scurvy. The trough or vessel in which they drink their milk, should likewise be kept clean and not suffered to get sour.

We let the milk stand about 12 hours, before it is skimmed: giving a calf at first about four parts night and morning; increasing the measure as need requires, till he is six weeks old, from which time till ten weeks old, he will require perhaps about twelve quarts per day.

When about ten weeks old we begin to diminish the quantity of milk for about the space of two or three weeks, at which time we wean them. During the whole process from two to thirteen weeks old, calves should be well supplied with good hay, salt and provender; such as oats, wheat bran, and oil-cake ground fine: they should also be supplied with scum or dirt (though scum is the best) which is a preventive against scouring.

The particular advantages to be derived from the above method of treatment are the following:

1. It is much cheaper than to let them suck the ordinary way; whereas it makes a great saving of cream for butter, and that without injuring the calves if they are properly attended to.
2. It prevents calves from weaning, or pinning much while weaning, as they would otherwise do, when taken from the cows.

3. It not only prevents the cows being injured in consequence of the calves biting the teats; but also prevents their holding back their milk from the milker, which often serves to diminish the quantity of milk afterwards. The only disadvantage to be found in the above method of treatment is that it requires some more labor to feed them, where they thrive equally well in every respect, as those do which are permitted to suck in the ordinary way.

Those two calves, mentioned in your letter, which you saw here last fall, were a couple that came late, and which we kept from grass, supposing they would do better on hay; but the result gives us no encouragement to recommend the practice, it being more expensive, and perhaps no better; although the two calves above-mentioned did equally well as those that were turned out to grass.

Should the whole, or any part of the above meet with your approbation, you are welcome to publish it in the New England Farmer.

Yours, with due respect,

FRANCIS WINKLEY.

To the Editor of the New England Farmer,

DEAR SIR,—Your remarks, on my account of S. B.'s experiment of fastening a dead lamb upon the limb of an apple tree, page 283, vol. ii. seem to convey the idea that I had recommended the practice of feeding trees by the application of dead lambs, or other putrescent animal substances as the most eligible way of manuring them. But it was very far from my intention to wish you or any of your readers to put that construction upon it. I have long had my doubts, as to the great benefits, (as stated by some writers) to be derived from incarcinating fruit trees in a thick coat of white wash, blue clay paint, or any other paste. And believing with D. W. Jr. that cleanliness is important to the human family*—and that frequent and judicious bathing is better than anointing the body with bear's grease or fish oil, and ochre, as practised by the Hottentots, and many tribes of Indians—I think it but rational to infer that the circulation (or inhaling and exhaling) the gases is less impeded, when the trees are kept clean by soap suds, &c. and of course more healthy, than when pasted—and my communication respecting S. B.'s experiment was rather in confirmation of D. W. Jr.'s statement of the limbs immediately over his compost heap, than for any other object. I most heartily concur with you in thinking it to be a "disagreeable, unwholesome and wasteful way of manuring the tree."

L.

Warner, N. H. April 13th, 1824.

BY THE EDITOR. It was not our intention to intimate in our remarks on the communication of our respected correspondent, (published in a former paper, page 269, vol. ii.) that he "had recommended the practice of feeding trees by the application of dead lambs to their branches." We agree with him and D. W. Jr. in opinion that any application which closes "the pores of trees" will prove injurious. We meant

* See page 253, N. E. Farmer, 2d vol. on Fruit Trees.

nothing more than to take that opportunity to enter a protest against the practice of some cultivators, of suspending the carcasses of lambs, and other small animals, on the branches of apple trees, and other fruit trees, near their dwellings, and thus diffusing noxious effluvia where their influence would be pernicious to health, with little comparative advantage to the trees.

SIEVES, OR BOXES FOR VINES.

To the Editor of the New England Farmer,

SIR.—I, sometime ago, promised you, an account of my method of making sieves, or boxes, to preserve melons and other tender vines from the yellow bug, &c. and now forward the following

DIRECTIONS.

Take a strip of pine board (about three fourths of an inch in thickness is most suitable) eight or ten feet in length, and four or five inches in width—plough one edge of it, with a carpenter's plough or match plain—then mark off an equal number of side and end pieces; before sawing the side pieces run a bradawl thro' where you want to drive your nails, as it is not so likely to split, as after it is sawed. The side pieces eleven inches long—ends eight inches long. They must be of this particular size, because one yard of millinet will just cover nine boxes; or a third of a yard will make three covers. After having nailed your boxes and divided your millinet, have some thin straps or tongues, as the carpenters call them. Press these with the edges of the covers into the groove—which fastens them much cheaper and more expeditiously, than small nails. I made about twenty last season, and they effectually secured them from the yellow bug, and (by sinking the edges of them in the earth a little), from worms—But if they were of no use, but to guard against insects, they would be worth having, as they keep off the cold winds and greatly promote the growth of the vines in the early part of the season.

I send you the expense of making 100 of said boxes and cost of materials in the place where I live.

11 1-2 yds. millinet at 18 cts. per yd.	\$2,00
150 ft. boards at 50 cts. per hundred,	.75
3 lb. shingle nails, at 8 1-3 cts. per lb.	.25
Carpenter I think could easily make	
100 per day,	1,00
	\$4,00

They would most probably last, with good care, a great number of years.

Yours, &c.

L.

ROT IN SHEEP.

To the Editor of the New England Farmer,

SIR.—I wish to inquire through the medium of your very useful paper, whether there has been discovered any efficacious remedy for sheep in the spring, which have become low and almost approached to the state called the rot, viz. we often find sheep in this season of the year so poor and diseased as to be unable to stand, and at the same time have a good appetite, eat well, and derive no nourishment from their food: at length there sets in a profuse di-

arrhea or what may be called scouring. Then a cadaverous scent from the extrication of the azotic gas,—and, lastly, death itself. Juniper berries are recommended as an antiseptic for sheep; but I never have found any remedy in this case; though I am well satisfied the preventive is a generous keeping, for as *septon* is the principle of the *septic* acid, and as this *septon* prevails abundantly more in the muscular and lean parts of animals than in the fat, those that are kept low will be much more subject to putrid diseases, and *vice versa*.

From the many curious experiments made by Sir John Pringle to ascertain the *septic* and *antiseptic* virtues of natural bodies, it appears that there are very few substances of a truly *septic* nature. Those commonly reputed such by authors, as the alkaline and volatile salts, he found to be no wise *septic*. However, he found some, where it was least likely to find any such quality; these were chalk, common salt, and testaceous powders. He mixed twenty grains of crab's eyes, prepared with six drachms of ox's gall, and an equal quantity of water. In to another phial he put an equal quantity of gall and water, but no crab's eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner, where the powder was, than in the other phial. On making a like experiment with chalk, its *septic* virtue was found to be much greater than that of the crab's eyes; nay, what the Doctor had never met with before, in a mixture of two drachms of flesh, with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days.

To try whether the testaceous powders would also dissolve vegetable substances, the Doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration by a fire, the plain water was found to swell the barley, and turn mucilaginous, and sour; but that with the powder kept the grain to its natural size, and though it softened it, made no mucilage and remained sweet.

Nothing could be more unexpected than to find sea salt a hastener of putrefaction; but the fact is thus: one drachm of salt preserves two drachms of fresh beef in two ounces of water, above thirty hours uncorrupted, in a heat equal to that of the human body, or which is the same thing, this quantity of salt keeps flesh sweet 20 hours longer than pure water; but then half a drachm of salt does not preserve it above two hours longer. Twenty-five grains have little or no *antiseptic* virtue; and ten, fifteen, or even twenty grains, manifestly both hasten and heighten the corruption. The quantity which had the most putrefying effect, was found to be about ten grains to the above proportion of flesh and water.

Many inferences might be drawn from this experiment; one is, that since salt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is subservient to digestion chiefly by its *septic* virtue, that is, by softening and resolving meats; an action very different from what is commonly believed.

In the above described case where the sheep has a good appetite, and putrefaction has not actually taken place, it appears there may be a remedy, and if so probably it must be a

very powerful *antiseptic*. Therefore, if the above question could be agitated in the New-England Farmer, and gentlemen of science and experience would discover a remedy, and communicate the same to the public, they would render an essential service to the agricultural interest.

Yours, most respectfully, &c.

SETH CHANDLER.

Minot, Me. April 14, 1823.

From the Massachusetts Yeoman.

Mr. DENNY,—In a late paper you have published from the American Farmer a treatise upon the management of Fruit-Trees, in which the principal object of the writer seems to be to “protest against the too common practice of *white-washing* them.” He asserts that the caustic quality of the lime not only kills the insects, for which the wash is intended, but trees also, by stopping up the pores of the bark, thereby preventing the absorption of those gases that are as essential to preserve and promote vegetation, as it is necessary in the human system, to keep open the pores of the body to preserve health and vigour.—“How long,” he asks, “would a man continue healthful, were his body to be encrusted in paste?” The subject is important, and the doctrine of the writer so novel that it merits investigation.

I shall not determine how far the analogy between the bark of the tree and the human skin holds true; but if the pores of both have the same functions, as must be assumed by the writer in his elucidation, a wash of *beef tea* might be beneficial, whereas a thick coat of *hasty-pudding* might be injurious. It does not necessarily follow, that, because a thick plastering of lime mortar is prejudicial, a light white-washing with the same material would be destructive. If the pores of the bark absorb the gases that are essential to preserve and promote vegetation—and it is thought that no substance affords this essential more pure and abundant than lime—why may not those gases be generated by the wash, and directly imbibed, or attracted from the atmosphere by its application? The crust adhering to the tree, from an annual white-washing, surely cannot be so impervious as to exclude the gas, when the wash is a powerful attractive of moisture from the dew, which is supposed to be the most efficient agent of its inhalation. But, still, should the coating be put on so thick as to prevent an absorption from the atmosphere, (and it is at least questionable whether the bark of a tree is constructed for this purpose) a more abundant supply of nourishment might be generated and furnished for the leaves and capillary branches, a supposed medium of communication, so that the trees, like those of the writer in the Farmer, in their anxiety to inhale every exhalation, would not be under the necessity of bending down their branches to snuff it from a compost heap!

The “fact” in confirmation of the writer's opinion of the utility of keeping open the pores of trees, is not a conclusive illustration of his doctrine, unless he assumes another fact that the nourishment which contributes to the growth of a tree is *wholly imbibed through the pores of the bark*. Otherwise, I cannot see why the trees should not grow luxuriantly in his highly enriched orchard, notwithstanding they might be

“covered with a thick crust of lime by white-washing.” Their is a powerful caustic quality in lime; and it may be too freely used, I admit at the root, and on the body of a tree.

I have also, for many years, given some attention to the cultivation and management of fruit-trees, and fully agree with the writer, that soap and water, with an infusion of tobacco makes an excellent wash. If, *often repeated*, and, as far as it is applied, it will preserve the tree from the insects which make their lodgment on its bark. I have been led to ascribe efficacy in the growth of trees to its finding its way to their roots, and in affording an exhalation for its branches, rather than from much permanent benefit to the bark; as it is liable to be washed off by every successive rain. I have seen no reason to be satisfied, like the writer that “*cleanliness* is as important to trees as to the human family,” any farther than it consists in cleansing them of moss, and coarse bark which indicate the want of due vigour. Here his analogy fails.

The wash I use and have recommended, is less caustic than white-wash, and partakes of the quality of soap and water. It is composed of 1 lb. of pot-ash, 1 lb. of unslaked lime, in gallons of water. To this I add cow manure sufficient to make it of the consistency of the paint. When pot-ash is not readily obtained, use weak ash ley instead of water. This application is durable, and although an *unclean dress*, I have found (adopting the figure of the writer) that my trees are delighted with it. Their bodies are invigorated, their bark is expanded, and they hold their heads erect, big and proudly. I have had reason to believe that a crust, from mild ingredients, is beneficial. When the bark of my trees has been extensively injured, I spread a plaster of cowdung on clay upon strong cloth, and tie it on with tar-cord, that it may exclude the air and weather until the wound be healed, or the bandage comes too tight. If the tree is small, I encase the whole body. When the coating is removed, I have noticed a more healthy and fresher state of the bark under the whole dress than in other trees, or in other parts of the same. A covering in itself necessarily porous which will yield to the moisture of the atmosphere, if not so caustic as to bind the bark, will, I am confident, occasion the injury the writer apprehends. Tar should never be used on the naked body of a tree. It hardens and constricts the bark; and forms a ligature to prevent the circulation of the sap. My method was, to use it, to tie a strip of paper, or cloth, or the tree, and tar over it. These strips will last as long as tarring is necessary.

O. FISKE.

Worcester, March, 1824.

MILLET.

Extract of a letter from the Hon. Bushrod Washington, relative to the Culture of Millet.

Mount Vernon, April 14, 1824.

“About the middle of May last I sowed about five acres of ground with Millet seed (millium) at the rate of about a bushel of seed to the acre.* The ground was ploughed

* In the spring of 1823, the above lot was cultivated in Millet, (without being manured,) and produced a fine crop; in October it was sown with rye and

rough manner, and was in bad order when the seeds were sown, it had been slightly top-dressed with barn manure some years past, and as still in good heart: the growth of the crop of Millet was rapid and luxuriant, inasmuch that it attracted the attention of every person who visited the place. Intending to use the crop as hay, and finding the heads quite full of seed, and in some instances falling on the ground, I cut it down, on the 16th of July, (with cradles and scythes) four acres, leaving the Millet so as to lie in swarth for a few hours. In the afternoon of the same day, it was carefully turned over, and the next morning, after the dew was off, it was bound in sheaves, and in the course of the same day, it was hauled to the barn loft and put away. During the whole of its process, the weather was as fine as could be desired. The remaining acre, which was intended for seed, was cradled on the 23d of July, and left in swarth till the next day without turning it, when it was bound in sheaves, and set up in small open shocks, with the heads to the sun, till about 3 P. M. of that day, when it was hauled to the barn and packed away. The whole crop was cured of a fine green color, and though the stalk appeared in the field to be strong and stiff, it became in a few days after it was housed, nearly as flexible as clover, or timothy.

I weighed the sheaves taken indifferently from some of the wagon loads, and in this way ascertained myself that the product of each acre was about 3500 lbs. Having entertained (from what I had read on the subject) very sanguine expectations of the product of this piece of ground, I expressed to my foreman my disappointment at this result. His observation was, that he presumed that those who had gathered larger crops had probably mowed them, whereas the stubble left on the ground, in consequence of the cradle having been used, would have added twenty or twenty-five per cent to the quantity. I then went over the field and found the stubble to be about half leg high, and in many places much taller; but the protection which it afforded to the ground, and the benefit which I presumed it would derive from being turned in for the reception of small grain, determined me in future to pursue the same mode of cutting, believing that the sacrifice of part of the hay would be more than compensated by the improvement on the land and the increased product of the succeeding crop of

oats, and at present promises a rich harvest. The second crop was nearly as good as the preceding summer, though it suffered much from the drought in May and June. Sheep are particularly fond of the Millet seed, but not more so than horses and other stock. The Millet seed, when ground and well bolted, makes as equally as good as the buck wheat meal. Soil answers for grain or grass, is adapted to the growth of Millet. It may be sown at any time from the 25th of April till the 1st of August, at the rate of a bushel to the acre.

Extract of a letter from John Hare Powell, to Jonathan Roberts, President of the Pennsylvania Agricultural Society.

"Millet succeeds best on light land, and requires as much strength of soil as is necessary to produce heavy crops. I have not seen either in Europe or America, a green crop which so largely rewards accurate tillage and plentiful supplies of manure. I have sown from the 1st of May, to the 20th of June, and have invariably obtained more fodder than could have been obtained from any grass under similar circumstances."

grain. Another advantage in cradling seems to be, that the hay, by being spread, can be more easily removed and put away than if it were mowed and treated as timothy or clover.

The Millet cut from the last acre, on the 23d of July, was carefully threshed in the autumn, and, to my great disappointment, produced only 15 bushels of clear good seed; but, I then discovered from the quantity of chaff and light grains thrown away by the fan, that I had cut it much too early for seed. Had it remained on the ground until the seed were ripe, I think it highly probable that the quantity would have doubled, or nearly so. The Millet was generally from 6 to 7 feet high through the lot, and the heads from 5 to 6 inches long, and well filled. Judge Peters says that he has raised a very fine crop of wheat on the millet stubble, when, in the same year, his crop was indifferent in the oat stubble, under the same circumstances.

On the 5th of May, five bushels of Millet seed were sown, on four acres; on the 5th of July, the crop was hauled, and estimated at four tons per acre? I have obtained this season, forty tons from sixteen acres of which four only had been manured; the remainder could not have borne a good wheat crop. I have generally used a large quantity of seed, as not more than two thirds of those which are generally sown vegetate. Whilst my oxen consumed Millet in its green state, they performed their work with more spirit and vigor than they had done before, or have shewn since, except when fed with grain. My cattle of all ages prefer it to both red and white clover meadow hay. All kinds of birds are very fond of it, and not more so than the different species of poultry—an invaluable food for fattening them. The seeds in the upper parts of the stalks, generally ripen first; I therefore cut it when the upper parts of most of the heads contains seeds which are hard. All my observations have confirmed me in the belief, that, in this stage, it affords fodder more nutritious, and more easily made than any sort of hay. I would recommend Millet not merely for its value as food but for the means it affords of making clean the land, without summer fallows or drill crops. Deep ploughing at proper seasons, is, I conceive, the basis of all good farming. Such crops as shall enable the husbandman to extirpate weeds, and obtain large supplies of fodder, without much exhaustion, should be the great objects of his aim. When Millet is cut down with cradles to the scythes, a considerable quantity of vegetation is left on the ground; and the general opinion is, that it is sufficient to prevent any exhaustion of the land; such has been the result of experiments by the most judicious farmers.

Method of preserving Meat in Tunis.—Take half a pound of black pepper, half a pound of red or Cayenne pepper, half a pound of the best saltpetre, all beat or ground very fine; mix these three well together, then mix them with about three quarts of very fine salt; this mixture is sufficient for eight hundred weight of beef. As the pieces are brought from the person cutting up, first sprinkle the spice, and introduce a little into all the thickest parts; if it cannot be done otherwise, make a small incision with a knife. The first salter, after rubbing salt and spice well into the meat, should take and mould the piece, the same as washing a

shirt upon a board; this may be very easily done, and the meat being lately killed, is soft and pliable; this moulding opens the grain of the meat, which will make it imbibe the spice and salt much quicker than the common method of salting. The first salter hands his piece over to the second salter, who moulds and rubs the salt well into the meat, and if he observes occasion, introduces the spice; when the second salter has finished his piece, he folds it up as close as possible, and hands it to the packer at the harness tubs, who must be stationed near him; the packer must be careful to pack his harness tubs as close as possible. All the work must be carried on in the shade, but where there is a strong current of air, the harness tubs in particular; this being a very material point in curing the meat, in a hot climate. Meat may be cured in this manner, with the greatest safety, when the thermometer in the shade is at 110°, the extreme heat assisting in the cutting."—*Jackson on the Commerce of the Mediterranean.*

Invention.—The ingenuity of our mechanics is proverbial. We have examined a machine invented by a Tailor by the name of Camfield, the corner of Provost and Chapel streets, for measuring persons on mathematical and anatomical principles for clothes, by which he furnishes a complete suit immediately. He would not permit us to have a specification of it, but it is on curious principles. He fits boys immediately.—*Nat. Adv.*

According to the observations of M. H. Dutrochet, the height of the Meteor, which projected the meteoric stones, at Charsonville, in the Department of the Loire, on the 23d of November, 1810, was about 14,724 toises. Mr. Bowditch found that the perpendicular altitude of the meteor, which discharged the meteoric stones at Weston, in North America, on the 14th December, 1807, was 15,360 toises, or about 16 miles.—*London Monthly Magazine.*

There is a disease very prevalent in Wurtemberg, (Germany) but little known elsewhere, which is induced by eating smoked sausages, and is most fatal every spring, especially in the month of April. A pamphlet on this subject, by Dr. Justinus Keimer, has appeared at Tubingen. According to this work 76 persons were taken ill, from eating smoked sausages in a very short time, and in quite different parts of the Kingdom; 37 of these died; others dried up to mummies, and carried the poison in them for many years. The liver sausages are the most dangerous; of 24 persons who ate them, 12 died. It appears by Kemirinswert's discoveries, that this poison is not prussic acid. It is different from all hitherto known poisons, inasmuch as it leaves the brain and spinal marrow unaffected; but suspends the action of the sympathetic or ganglion system, in its whole extent. Hence arise very remarkable results for physiology.—Thus, for instance, in a person affected by sausages, not the slightest pulsation of the heart was perceived for months together; while, notwithstanding this, the pulsation of the arteries remained almost regular. This poison appears, according to Keimer, to have the most resemblance to the dipass serpent, or to the supposed effects of the aqua tefana.

London Literary Gazette.

From the Acadian Recorder.

Extract from "Minutes of an Agricultural Tour, performed by JOHN YOUNG, (the able author of "Letters of Agricola") through the eastern parts of Nova Scotia, in 1833.

"Pictou. Visited the Academy—a light, airy and elegant building, at once an ornament and honor to the town. Saw several boxes of moths and butterflies disposed with much taste, not I mean with respect to their genera and species, but so as to produce on the beholder a pleasing effect. They were designed for Edinburgh, and must satisfy the curious in natural history there, that this province enjoys a most delicious summer, which could bring forth different kinds into life, and spread over their wings so many brilliant and dazzling colors.—The method of fixing them into these little cabinets is extremely simple. The inside of the box is neatly pasted over with white paper, and then on the bottom and the lid, pieces of cork about half an inch square, are stuck with glue in the quincunx order, so that in whatever direction the eye views them, they seem ranged in straight lines. Pins are then passed through the bodies of the insects, and fixed to the corks, generally four in each. The wings are carefully dilated, in order to shew the fine tints which nature's pencil has laid on them, and also to discover the back and body, which, in many species, are dressed in the richest velvet or protected with the softest down. Abstracted from all considerations of utility, these boxes were a feast to the eye, and as far as I could judge, displayed a very happy combination of forms and colors.

"Quitting the institution and crossing over into the main street, I was accosted by one of my acquaintances, an inhabitant of the town, who said with rather a droll cast of his eye, 'Ah, so you have been visiting our college; I thought a farmer would not have troubled himself with such things.' 'All the farmers in the province, I replied would be much benefitted, were institutions like this set down in every county; for it is my opinion that no man can cultivate the earth skillfully, who is ignorant of the principles of a good education.'

"This sentiment of my friend is not uncommon among a certain class of men. They think that a plough needs nothing save a stout back and a powerful brawny arm. Than this there can be hardly a more mischievous opinion. Agriculture is a complete science, placed forever beyond the reach of an unlettered understanding. The ordinary rules of practice may be comprehended and successfully followed by those to whom knowledge is a 'scaled fountain;' but in obeying these rules they act from a blind impulse, and can never reach the point of controlling and regulating them. It is the want of education which has so long kept back our farmers from adopting those improvements that had grown up in other countries; and till this want be supplied by such academies as that at Pictou, we cannot expect from them the best directed efforts, nor the higher degrees of enterprize. Intelligence, in all states of society, is the forerunner of wealth; and ignorance has been formerly, and ever will be accompanied with sorry cattle, imperfect implements, faulty modes of manage-

ment and prejudicial views in all the great operations about a farm. The introduction, therefore, of a better system of education will dispel the clouds that have too long brooded over our people: and I cannot but congratulate this district on its library, its printing press, its philosophical apparatus, and even its boxes of butterflies. An Academy of this kind should be supported not merely by the merchants, but by the farmers of Pictou; and they may rest satisfied that their sons, trained in such a school with a little dash of philosophy, will be able to plough, sow and drill better than the gaping boors who despise learning.

"The Agricultural Society of the West River was founded among the first of those now existing, and gave the example of the first ploughing match in the Province. What particular causes here awakened this spirit it is not easy to trace; but the effects are strongly marked, and strike the traveller as soon as he descends to the foot of Mount Tom. The ridges in the fields lie in straight lines, and are better rounded off than what are to be met with elsewhere. The very air itself speaks an improving district, and the happy, contented faces of the inhabitants are sure indications of ease in their circumstances, and of comfort at their fire sides. All along the road there are every where specimens of a superior style of ploughing, and in the neighborhood of the town, there are farms whose management would discredit no country. The fields are cast into regular shape—the fences kept in good order—and the houses and barns possess that neat look which is the ordinary concomitant of industry and competence.

"Whether the improved aspect of the country be attributable to the society would not have been a question at this time of day, had there not existed men who were disposed from the very first to raise a clamor against the general conviction. I had hardly entered on this district before I met with one of those, who to my inquiries about the success and utility of the West River Association, replied in a long string of declamatory matter, and ended that he thought their society had led its members astray, and done more mischief than good. The premiums, he said, for the best crops on one acre had tempted the members to cart all their manure on a particular spot, to the evident disadvantage of the rest of the farm; and had tempted them to bestow their chief care on the old worn out land, instead of removing the stumps and taking in the new. Whenever I fall in with a sturdy veteran of the old school, I no more think of opposing him, than of fighting with the Cossacks; and I yield that humdrum assent, which would do any thing but please a very keen observer. Every man is free to form his own opinions and to express them; but he must have a high idea of his own discretion, who imagines that he discovers flaws in what is approved of by the generality of his neighbors. That some one of our farmers may have injudiciously expended his manure on purpose to win a prize, may, I apprehend, be fairly confessed; but that the system of encouragement to one acre is wrong must be supported by very strong evidence to gain belief.

"It will be recollected that the fertility of this country in comparison of others was stout-

ly denied for the first two years of our progress; and it became, therefore, a matter of first moment to undermine an opinion, which cut the sinews of all industry. The hand becomes feeble, if its efforts either are fruitless or are repaid with less than the average of wages. Improved cultivation was not worthy to be introduced here, unless it was to return a fair adequate requital; and in order to set this controversy at rest, it was essential to ascertain on a large scale of experiment, how much our soil could produce. By limiting the competition to one acre, the poor man as well as the rich could enlist as a soldier in this good warfare, and fight the battles of his country.

"But another capital and noble effect has resulted from the plan. Our old lands at the commencement of the societies, had been brought into such a wretched condition that they were absolutely abandoned to weeds and natural grass, and the forest was yearly invaded for the raising of bread corn. A belief had gone abroad, that they were of very little use, and they stood low on the score of fertility.—The axe and the fire more than the plough were relied on for producing wheat; and the most of our farmers were of opinion that the worn out soil could not be renovated. The prizes on one acre have done away with all these prejudices; and it is now found that the new settlers have no chance in a general competition. The productiveness of the old land has opened a new mine of wealth, where was formerly supposed there was nothing but poverty and barrenness.

"But I believe that it is impossible to please men by any set of measures; and therefore the trite story of the clergyman, who accepted of a church on the condition of giving whatever sort of weather his hearers would ask, betrays a clearer insight into human nature than is supposed. He knew beforehand, and pronounced on it, that they would never agree, whether he was to send them sunshine or rain."

From the United States Gazette.

On the Manufacture of Grass and Straw Bonnets. No. I.

I regard the manufacture of straw, chip, or grass bonnets and hats, so important to the people of the United States, that I desire to offer them through your paper, some remarks on the subject, in the hope of persuading them to consider it seriously, and that they will use their influence with Congress, to increase the duty upon Leghorn hats, so as to enable the American fabric to become firmly established an event which cannot be expected to take place so long as the present low duty is continued.

In the National Gazette of Philadelphia of 6th Jan. last, we find the following extract: "It is stated, that in the counties of Worcester, Middlesex, Norfolk and Bristol, Massachusetts there have been manufactured about 300,000 bonnets in a year, at an average price of \$2.75 per bonnet, amounting to \$825,000, employing 25,000 persons, most of whom were female from the ages of four to twenty years. Those employed in plating straw, have been enabled to support themselves, and in many instances to assist those of their immediate friends in destitute circumstances. The business is now a stand. The bonnets that three years ago

ould command \$2.75, will not now sell for more than \$1.25." The cause of the business being at present at a stand, is not mentioned; but the real cause is, the immense importation of hats and bonnets from Leghorn, at all prices. Mr. Baylies stated in a recent debate on the Tariff, that during the last year \$800,000 worth were imported. With the view of enabling the American fabrics to compete with the Leghorn, the Committee on Domestic Manufactures proposed to increase the duty from one dollar to three dollars, upon all Leghorn hats or bonnets of straw, chip, or grass, which at the place whence imported, with the addition of ten per centum, shall have cost less than three dollars. The resolution, it appears from the sketch of the debate on the occasion, was supported by Mr. Baylies of Mass. and Mr. Rich of Vermont, and opposed by Mr. Cambreleng, of New York, a firm and decided enemy of domestic industry (ship building excepted) and Messrs. Mar- and Sharpe, of New York, and Floyd of Virginia.

The proposition was not adopted. The majority against it is not given in the paper. I sincerely regret the loss of the motion, because the manufacture in the United States is more deserving of encouragement and protection than that of bonnet and hat making, for the following obvious and strong reasons.

1. Whether made from grass or straw, materials of comparatively small value, are converted into articles of great value, some of them of great value.

2. Because the manufacture gives employment to females and children, a class of people peculiarly deserving the fostering care of all governments, by reason of the influence which their labor may be made to have upon the wealth of the nation and the happiness, safety, and morality of society; and of their inability to avail themselves, as men do, of various other trades and employments, when the one by which they support themselves is cut off.

3. Because the articles which are the produce of their labor, would add to the national revenue by their being exported, and exchanged for others of a foreign growth or manufacture, upon the importation of which duties would be paid. Until the British laid a heavy duty upon American hats and bonnets, they were a profitable article to export to England, and the English paper stated that "by a return made to Parliament, it appears that in the year ending the 5th April, 1823, there were 176,000 straw bonnets or hats imported into England from America, and 3512 lbs. of straw plaited." There is no probability of the trade ever being renewed for the people of England long made acquainted with the whole secret of the manufacture, will push it to its most possible extent, and fill the world with it. What goods therefore are hereafter imported from England, which might be purchased by the sale of American bonnets, had not they been laid, must be paid for by thrift received from other sources, but what these are, remains yet to be discovered.

4. Because it is a manufacture that does not require those engaged in it to be collected in large work shops, but may be carried on at home, may occupy the leisure days of the females and children. Thus morality is promoted, the fruits of neat industry are instilled, happiness

insured, and profit obtained, of which, without such employment, they might be deprived.

Considering these arguments, it is really to be wondered at, that our Congress should refuse to increase the duty upon Leghorn hats and foreign straw bonnets, so as to enable the domestic fabric to compete with the imported articles of the same kind; especially too, after hearing from Mr. Baylies, of the many thousand women and children who depended upon the manufacture of bonnets as a means of support; of the poverty to which the loss of their usual employment must inevitably reduce them; and of the great value of their labor to the nation.

The members of Congress and the people of the United States, of all parties, are requested to ponder on these facts, to draw the conclusions from them which cannot fail to arise in their minds, and to remember them when they are told by the enemies to domestic industry, that the statesmen of the old world are relaxing their restrictions upon trade. *Dr. Cooper in particular is requested to attend to them, in case he comes out with another pamphlet and more memorials against encouraging domestic manufactures of the United States.* Miss Sophia Woodhouse (now Mrs. Wells.) and Miss Sally Hamner, of Wethersfield, Connecticut, had the merit of shewing at the exhibition of the Agricultural Society of Hartford, in 1820, the first bonnet made in imitation of the Leghorn hats, from native grass, called in that State, Tickle-moth. We learn from the survey of the county of Rensselaer, New York,* that its botanical name is *Agrostis Alba*. It is a common grass of the Northern and Middle States, but the excellent *poa viridis*, or green grass which is a native of the United States, and forms the green sward of Pennsylvania, would doubtless answer equally well if prepared in a manner similar to that pursued with the *Agrostis Alba*. If taken from the fields where it spontaneously grows it would answer for common hats; but for making those of a finer kind, the seed should be collected and sown very thick early in the Spring.—These seeds are doubtless to be purchased at seed stores. The grass for bonnets should be collected before they have attained their maturity.

A Friend to Agriculture, Commerce and Manufactures.

* Made at the expense of Stephen Van Rensselaer, President of the New York Board of Agriculture.—See *Memoirs of the Board*, page 31, vol. 1.

It is not certain that the *Tickle-moth* Grass, is the *Agrostis Alba*, but this latter species is called "The American Leghorn Grass" in the survey; and their identity is therefore taken for granted.—At all events the *Agrostis Alba* will answer the purpose of making Leghorn Imitation Bonnets.

(To be continued.)

From the American Farmer.

TURNIPS.

Pittsfield, Mass. Jan. 20, 1824.

Sir,—Some months ago I was induced to write you a communication on the subject of *turnips*, in consequence of an article of one of your correspondents, tending to discourage the cultivation of them—and as I then promised to give you the result of this year's crop, I avail myself of a little leisure, to redeem my pledge.

According to the weather, I have for six years practiced sowing turnips, from the 15th to the 25th of June. But this year, a severe

drought through the whole of June, and until the fore part of July, obliged me to delay it until the 10th—(too late by 15 days, at least, to warrant the hope of a crop of *maraboga*.) The land (gravelly) had been previously manured, at the rate of 20 ox cart loads to the acre. Immediately after sowing and rolling, gave the drills a top dressing of 12 bushels of slacked ashes per acre. They were ploughed, and hoed out twice. On the 10th of November, began to harvest them—and had at least 450 bushels to the acre, estimating an ox cart at 30 bushels.

The expense of cultivation, and harvesting, does not exceed that of corn—of which the average crops of the country may be stated at 25 bushels. The corn I raised this year, was manured in the same manner as the turnips, and we had about 50 bushels to the acre. In my estimation, six bushels *ruta baga*, are equal to a bushel of corn for any kind of live stock.

It is objected by some, that it is a troublesome crop to secure through our long, and severe winters;—It is not more so, however, than potatoes and the value of stock, especially sheep, at the close of winter, and until grass will afford a good bite, (which is not generally until the 10th of May) can only be duly appreciated by experience.

It is doubtful in my mind, if the cultivation of turnips will answer to any extent, so far south as Maryland; but for the eastern and western states, it must, methinks, as we progress in agricultural improvements, become an important item in the rotation system of every good farmer, who combines arable and grass farming.

I have long been of opinion, that we might cultivate *rape* to advantage, in this section of our state, (at least for sheep,) being ignorant of the best mode of cultivating it, its proper soil, and the manner of curing and securing it, if raised for the seed. I beg leave to ask of you to appropriate a place in your valuable paper, to an article on the subject, in belief that it would be interesting to this vicinity.

AGRICOLA

From the Connecticut Courant.

FLAX.

While the newspapers are teeming with the exertions of farmers to out do each other, and at the same time to stimulate them to greater exertions, it may be satisfactory to some of your readers to know, that on one half acre of ground, by measure, there were raised the season last past three hundred and twenty-four pounds and thirteen ounces of well-dressed flax; and from the same, ten bushels and twenty-four quarts of seed, well cleaned, in this place, by me the subscriber. JOSEPH B. BLODGET.

East-Windsor, March 15, 1824.

Warm Water.—Warm water is preferable to cold water, as a drink, for persons who are subject to dyspeptic and bilious complaints, and it may be taken more freely than cold water, and consequently answers better as a diluent for carrying off bile, and removing obstructions in the urinary secretion in case of stone and gravel. When water, of a temperature equal to that of the human body, is used for drink, it proves considerably stimulant, and is particularly suited to dyspeptic, bilious, gouty and choloretic subjects.

NEW ENGLAND FARMER.

SATURDAY, APRIL 24, 1824.

FARMER'S CALENDER.

POTATOES. We have heretofore, vol. i. pages 286, 325, gone pretty much at large, into the subject of planting potatoes, and said something relative to the different modes of cultivating that very valuable vegetable. We shall, therefore, endeavor on the present occasion, to be as brief as possible; and although we may go over the same ground, we will not proceed exactly in the same track in which we have before travelled.

You will do well to plant some early sort of potatoes on a small, fertile, and forward piece of ground near your sty, which, together with your peas, (if you have any) will give you a chance to bring forward your pork, and get your hogs at least half fatted before your Indian corn is ripe enough to gather. With regard to the greatest portion of your potatoes, intended for the use of your kitchen, and for feeding your stock, &c. you may, perhaps, derive useful information from the following observations, which we copy from the 2d vol. of "Memoirs of the Board of Agriculture of the State of New York."

"Potatoes should be planted the first ten days in May, or a little before planting Indian corn. But it is better to postpone the planting of potatoes than of corn. Therefore, in the hurry of spring work, farmers often leave their potatoes to be planted in the last week of May. To plant them early will never injure the crop at any season, and if the season happens to be very dry about harvest time, the crop will be much better if planted the first of May.

"Seed potatoes should never be cut—one large whole potatoe is sufficient for a hill. The outside skin of a potatoe called the cuticle is the most durable part, and retains the moisture for the use of the young plant, until it is all exhausted. If potatoes are cut the nutritive juice is absorbed in a great measure by the earth.—The evil of cutting seed potatoes is more manifest on a dry soil than if moist. It is a mistaken opinion that a whole potatoe is not good on account of bringing the plants too near together; for the roots which yield all we seek for, spread in all directions, and fill the hill.

"Potatoes, if planted in a sandy or loamy soil, will yield one third more if a table spoonful of plaster be thrown upon the naked potatoes in each hill, after they are dropped and before they are covered.

"Yard manure is very useful, if laid over the potatoes in each hill, and after an inch of soil has been laid upon them; and then the hill covered as deep as usual. But if the manure be laid directly upon the seed or under it, a drought will injure the crop.

"The most convenient method for raising potatoes is to plant them about the margins of corn fields. Then a horse may turn upon them when ploughing among the corn without injury."

"If the land on which you plant potatoes is infested with grubs, or wire worms it may be well to strew quick lime over it, at the rate of about two bushels to the acre, immediately after plant-

ing. Or if lime cannot conveniently be had, you may try the effect of a bushel and a half or two bushels of salt to the acre. But neither of these substances should be put into the hills or suffered to come in contact with the seed potatoes.

A letter from William Moody to the Hon. Josiah Quincy, published in the 4th vol. of the Massachusetts Agricultural Repository, page 353, recommends sea sand, as an antidote against the wire worm, and, no doubt it would prove efficacious against other insects, which devour potatoes while in the ground. This writer says "I am persuaded, from experience, that sea sand, put under corn or potatoes with manure, or spread on the land, will go far, if not wholly to the total destruction of those destructive worms, [wire worms] on which nothing else seems to have any effect. It has a beneficial effect spread on land before ploughing, or even after land is planted with corn or potatoes; not only to destroy the wire worm and other insects, but to increase the crop. With my neighbors a load of sea sand is considered preferable to a load of their best manure, to mix in with their common barn manure, or to spread on their gardens and low flat land."

Mr. Moody likewise says, in the same letter, "late planted potatoes, which are gathered in before ripe are far the best for seed the next year. If kept in a dry warm place in a cellar, they will be much earlier, and likely to produce more abundantly the next year, and will be as good for use the following spring, though they may not be so good in the fall." He then gives the details of an experiment in which potatoes were planted the 7th day of July, which produced the largest and most in a hill of any raised by the author that season. The same potatoes, planted the spring succeeding came up some days sooner than others of a more early kind. We think it would be well to repeat this experiment, make others of a similar nature, and let the result be made public for the good of the community.

We are happy to be informed that **FREDERICK HALL**, late Professor of Mathematics and Natural Philosophy, and Lecturer on Mineralogy at Middlebury College, has been appointed Professor of Mineralogy and Geology by the Corporation of the University of Vermont, at Burlington. From our personal acquaintance with Professor Hall, we are induced to believe that this appointment will prove beneficial to the University, and serviceable to the public. We know Professor Hall to be a gentleman, whose talents, acquirements, and indefatigable industry, entitle him to a high standing among our American literati. His means for the acquisition of knowledge have been more ample than those which usually fall to the lot of our countrymen. A residence for a considerable time in Paris, the Headquarters of European Science and Literature, has given him opportunities of which, we believe, he has fully availed himself. Since his return he has directed his pursuits, principally, to investigating and developing the natural riches of our soil, and to bringing to light those mineralogical treasures which are bountifully bestowed by the Great Author of Nature on our highly favored portion of the Globe; but require the eye of science and the hand of the artist to produce, and fashion to the use of the Agriculturist and Manufacturer.

FOREIGN.

By the packet ship *Amethyst*, Captain Bussey, arrived at this port on the 21st, London dates to the 12 March have been received. By these it should see that England has offered to mediate between Spain and the South American Provinces. But his Catholic Majesty declines the proposed mediation, and announces his determination to strain every nerve to recover the Provinces, in a tone of confidence, which would seem to be inspired by a reliance on the assistance of other European Powers. The Russian Ambassador has made a speech to Ferdinand which gave intimations of assistance, and it is rumored that a negotiation has actually commenced for the purchase by Spain of ships war from Petersburg.

An article dated Stockholm, Feb. 20, declares that Sir R. Blomfield, the British Ambassador, had received dispatches from his Court, and made a verbal communication to the other foreign Ambassadors at Stockholm, stating, in substance, that if Spain, in attempting to recover her lost possessions in America confines herself to her own means and resources, Great Britain will remain a quiet spectator; but should any other power join and assist Spain, Great Britain will recognise the new governments which are establishing in South America.

LONDON, March 12.—By letters from Trieste, dated on the 24th ult. information has been communicated the arrival there of a vessel from Missolonghi, in 10 days. The news received by this channel is important and satisfactory. The Greek army had been divided into batallions, according to the English custom and was, at these dates, undergoing the discipline of European troops. A great number of the chiefs had assembled at Missolonghi, and the necessary instructions had been promulgated for introducing modern tactics into every quarter of the military service that part of the Federal Republic which had, at a period in question, been liberated from Asiatic subjugation, for the greatest harmony prevailed among the leaders of the different provinces, who had assembled in the Senate, to form laws for their future government. A plan also for the offensive prosecution of the campaign had been maturely deliberated on, and various improvements, had been finally adopted. "was of course kept a secret, but enough was conjured to create an universal belief, that its issue would be splendid, and its results most beneficial to the establishment of this formerly mighty Empire.

BRUSSELS, March 5. Recent letters from the chipelago state that the Greeks have again made landing twenty leagues to the north of Smyrna; they levied large contributions, and required a large quantity of provisions, after which they re-embarked. Other parts of the coast of Asia Minor have likewise been disturbed by the Greeks, who, being masters of the sea, seize the richest Turks in Natolia, who are obliged to pay large ransoms.

Lord Byron had been recognized by the government of Western Greece, as *President of strangers*.

DOMESTIC.

Duel.—A duel has lately been fought in Georgia between two very young men by the name of Cogdell and Wigfall, on account of some trifling affair which happened at Yale College. They fought with rifles; thirty paces distant;—the latter received the ball in the antagonist below the breast bone, which came on the right side between the second and third ribs having touched the liver in its course; of which he died on the following day.

We hail with unfeigned pleasure, the announcement of the establishment of an **ANNUAL REGISTER** of this country, to be edited by Professor EVERETT. The extent and variety of this gentleman's information, and the versatility of his genius, singularly fit him for such task.—*Dos. Gaz.*

Robbery.—The store of Messrs. E. & G. A. Kirtland at Saybrook Point, was broken open on the morning of the 15th inst. and a quantity of goods, to the amount of several hundred dollars, was stolen. A reward of fifty dollars is offered for the thief and goods.

BEAUTIFUL BALLAD.

Oh! lady, buy these budding flow'rs,
For I am sad, and wet and weary:—
I gather'd them ere break of day,
When all was lonely, still and dreary;
And long I've sought to sell them here,
To purchase clothes and dwelling,
For Valor's wretched orphan girl—
Poor me and my young sister Ellen.

Ah! those who tread life's thornless way,
In fortune's golden sunshine basking,
May deem my wants require no aid,
Because my lips are mute, unasking;
They have no heart for woes like mine.
Each word, each look, is cold—repelling,
Yet once a crowd of flatterers fawn'd,
And fortune smil'd on me and Ellen!

Oh! buy my flow'rs, they're fair and fresh
As mine and morning's tears could keep them;
To-morrow's sun shall see them dead,
And I shall scarcely live to weep them!
Yet this sweet bud, if nurs'd with care,
Soon into fullness would be swelling,
And nurtur'd by some generous hand,
So might my little sister Ellen.

She's sleeping in the hollow tree,
Her only home—its leaves her bedding;
And I've no food to carry there,
To soothe the tears she will be shedding.
O! that those mourners' tears which fall;
That bell which heavily is knelling,
And that deep grave were meant for me,
And my poor little sister Ellen!

When we in silence are laid down,
In life's last fearless, blessed sleeping,
No tears will fall upon our grave,
Save those of plying Heaven's own weeping.
Unknown we're liv'd, unknown must die,
No tongue the mournful tale he telling,
Of two young, broken-hearted girls—
Poor Mary and her sister Ellen.

No one has bought of me to-day,
And night is now the town o'reshading,
And I like these poor drooping flowers,
Unnoticed and unwept are fading;
My soul is struggling to be free—
It loathes its wretched earthly dwelling!
My limbs refuse to bear their load—
Oh God! protect lone orphan Ellen.

Miscellaneous.

ANECDOTES.

Lord, whose wife lay extremely ill, was disturbed in his studies by the entrance of her maid, who informed him her mistress was dying, and desired to see him. "Child, said he, tell your mistress I took formal leave of her yesterday."

On the day of the Eclipse, when all the inhabitants of Paris were without doors, provided with telescopes, and pieces of smoked glass, an Englishman was seen driving furiously in a fiacre, along one of the principal streets—"Where does my lord wish to go," said the driver; "to see the Eclipse," said the Englishman, thrusting his head out of the window, "only drive up to it as near as possible, for I am short sighted."

Dr. Wade, Agricultural Professor to the Dublin Society, sometimes lectures his class in the fields, among the productions on which he is lecturing. As he was thus employed, one day treating on potatoes in the beds themselves, he took occasion to speak of this practice. "Why, Doctor," said one of his auditors, "I think you are very right to lecture here on the side of the beds; for you know the faculty always recommend students to attend clinical lectures."

Maritime Enterprises of the Russians.—It appears from the last number of the *Annales des Voyages*, that M. Simonof, Professor at the University of Kassin, has given a sketch of the voyages of the Russians to the South Pole, which is full of interest. In Europe, it is not generally known that the circumnavigators, sent by the powerful Emperor of the North, have made, between the parallels of sixty and seventy degrees, a voyage round the Pole, much more complete and instructive than that made by the celebrated captain Cook. The island situated farthest south, which is at present known, bears the name of Alexander the first.—*Journal des Debats.*

A new gold coinage for Greece has been executed at Paris, under the direction of Denon, the traveller. The piece rather exceeds a sovereign in size. On one side is the archangel Michael, with the flaming Sword, and the Dove, the latter the symbol of Peace. On the reverse, a Lion, the emblem of strength, encircled by a Serpent, meaning to portray eternity; and around the word "Resurrection."

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has just received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seeds, which added to his former collection makes the greatest assortment in New England—among them are 50 bushels early and late Peas, of various sorts; 150 lbs. Turnip, 100 lbs. KUTA PAGA, 200 lbs. Carrot, 100 lbs. Beet, 100 lbs. MANGEL WURTZEL, 50 lbs. Cabbages of sorts, Cauliflowers, 100 lbs. Radish of sorts, Lettuce of sorts, Endive, Kail, Celery, SALSIFI, SCORZENERA, Onion, Leek, Sweet Marjoram, Thyme, Sage, summer and winter Savory, Lavender, sweet Basil, Chervil, Fennel, Burnet, Grass Seeds, viz:—Herds, red and white Clover, Fowl Meadow, Red Top—with a large collection of ORNAMENTAL SEEDS.

Garden Tools, viz:—Pruning and Budding Knives, Pruning Saws, Pruning Shears, Garden Reels and Lines, transplanting Trowels, Rakes, Dutch or Pushing Hoes, Edging Irons.

Gooseberry and Currant Bushes, Honeysuckles, Garden Roses, &c. 1200 Flower Pots with stands. GREEN HOUSE PLANTS, a large variety, constantly for sale, such as Roses, Myrtles, Geraniums, Agapanthus, Orange Trees in fruit and blossom, Rosa Multiflora or Garland Rose, Mountain Daisies, Laurenses, &c. 50,000 THORNS or QUICKS for live fences.

ENGLISH CHEESE, and fine ENGLISH SPLIT PEAS. March 27.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers here appointed Agents for vending LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

TO PRINTERS.

FOR sale at this Office BALL SKINS, at the usual prices.

AGRICULTURAL SEMINARY.

JOSEPH HOLBROOK & TRUMAN COE, will open in Derby, Conn. on the 2d Wednesday of May, a LITERARY, SCIENTIFIC, and PRACTICAL INSTITUTION.

The exercises they design to introduce, are the study of the Latin, Greek, French, and English Language, Rhetoric, Elocution, Geography, and History. Mathematics—such as Arithmetic, Algebra, Geometry, Plane and Spherical Trigonometry, Mensuration and Fluxions. Natural Philosophy in its various branches—Astronomy, Chemistry, Mineralogy, Botany, and Zoology. No efforts will be spared, to render these sciences Practical and fitted to Common Life.—With that view, particular attention will be given to Composition, Diction, written and extemporaneous Debates, the Elements of Arithmetic, and the higher branches of Mathematics in common business, Practical Surveying, the application of Natural Philosophy to various kinds of Machinery, Agricultural Instruments, &c. testing the principles of Chemical Science in mixing and preparing Soil-forming Manures, making Cider, Beer, Spirits, and other articles of Agriculture and Domestic Economy—Agricultural, Geological and Botanical excursions into various parts of the country, examining and fertilizing soils, and Practical Agriculture.

Upon most of the sciences above mentioned, Lectures will be given, attended with familiar illustrations, and the higher branches of Mathematics, will be conducted by a course of demonstrations, intended to show their nature and uses.

There will be given annually, in the winter, a course of Lectures on Agriculture, bringing to view the modes of Farming, which Experience has proved to be best fitted to different soils, climates, exposures, &c. the same time, explaining, as far as may be, the principles of science on which such practice is founded. The course will be designed as well for those farmers, who will attend, in that season of the year will permit them to attend, as the regular members of the Seminary.

It cannot be doubted that if the course here proposed should be extensively adopted, it would effect a great desideratum in the Education of this country, viz. to unite Theory and Practice, and thus training up youth to be both practical and scientific men, and by means prepare the way for the advancement of the useful Arts, particularly Agriculture; and, by instituting an agreeable variety in their exercises, it is held they may be kept almost constantly engaged, in a manner which will be both interesting and useful, and calculated to give them firm and healthy constitutions, and habits of systematic industry and morality.

The Institution is provided with Land, necessary Buildings, Philosophical and Chemical Apparatus, a Cabinet of Minerals, and it is intended, as soon practicable, to furnish an opportunity for youths to try or lessen the expenses of their education, by tending on industry.

Active measures have been taken to collect all improved methods of Education, both in this country and Europe, and every endeavor will be used to acquire such a System of Instruction and Government as to recommend itself, in a particular manner, to those who design to be teachers.

There will be two terms in the year, one commencing on the 2d Wednesday in May, the other the 2d Wednesday in November. Students not taken in less than six months—they will not all be required, however, to go through the same course, but to be under the instruction of such teachers, and attend to such studies, as will fit them for the course of study they design to pursue.

Board from \$1, 50 to \$2 per week.

Tuition Thirty Dollars a year. Courses of Lectures on Chemistry, Natural Philosophy, Mineralogy, Botany, Three Dollars each—which courses will commence at the opening of the Seminary.

Specimens in Mineralogy, Botany, or Zoology, Communications, particularly from Farmers and Merchants, directed to the Agricultural Seminary, at Derby, Conn. will be gratefully received.

Derby, Conn. March 24 1824.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but the subscriber who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

CULTIVATION OF VINES.

To the Editor of the New England Farmer.

SIR,—Perhaps there is nothing relating to our common gardening, in which people more generally err than in the manner of cultivating melons, cucumbers, and other running vines. I allude to the practice of having too many plants grow in a hill. As far as my observation has extended, it appears to be the common practice to suffer as many as from four to ten or twelve vines to grow in a hill. This, I believe, is an error. One good thrifty vine in a hill, I am satisfied is generally enough. I have been confirmed in this opinion, by seeing within a year or two, the effects of a few experiments on the subject.

Sometime in August, 1822, I visited a friend at Salem, who had two considerable water-melon fields. One of them was cultivated the usual way, that is in hills about three and a half feet distant, and with several vines in a hill. The other was planted in hills eight feet distant, each way, and but one vine in a hill was suffered to grow. Both fields were well matured, and in good order: but the difference in the crop was as great as in the manner of their cultivation. In the first mentioned field the melons were of an ordinary size and quality, and the vines were much blighted. In the other field, where the hills were eight feet apart, the vines had no appearance of light upon them, and the melons at that time, though they were not fully grown, were much the largest I ever saw. When they were gathered, as I have since been informed, one of them weighed above forty pounds, and several between thirty and forty pounds each.*

I seldom succeed in raising good melons, owing as I have supposed to the unsuitableness of the soil, it being of a wet, cold nature which causes them to blight. In consequence of this difficulty in bringing them to perfection, I have frequently wholly omitted planting them, although they are to me a real luxury. But the last season I was induced to plant a few similar to those I saw in Salem. My water-melon hills I had about eight feet apart; my musk-melons four, and I suffered but one vine to grow in a hill. Notwithstanding the season was very unfavorable, having frequent sudden showers, accompanied with wind, which blew the vines in every direction, yet my melons were very good, some of them the best I ever raised.

The advantage to be derived from having vines grow single, as I believe nearly as great, respecting the cultivation of cucumbers as of melons. A neighbor of mine, who is very curious in these things, last season, took me into his garden to see the effect of an experiment of his. He had planted his cucumbers in two rows of hills, manured alike. In a part of them he had but one vine grow in a hill, in a part two, and in another part three or more vines in a hill.

* These were the melons noticed in the New England Farmer, vol. I. page 63, and cultivated by Mr. Ware.

At that time, where there was but one in a hill, the vines were very flourishing, all the leaves green, the cucumbers very fair, and he assured me that he had gathered from them as many, as from the same number of hills that had three or more vines in a hill. That part containing two vines in a hill was visibly different, they appeared less luxuriant than those of but one; and in that part containing three or more vines in a hill, they were apparently on the decline, the leaves had mostly become yellow and some of them black.

Perhaps it may be thought that eight feet a part is a great distance for water-melon vines to grow and singly too; but when it is considered that a single vine, in a rich soil, will extend over a rod or even more of ground, I think it must appear rational that in a rich soil it is not too great a distance. Doubtless in a light sandy or gravelly soil, lightly manured, half that distance may be preferable.

P. R.

Franklin, April 23, 1824.

To the Editor of the New England Farmer.

SIR,—Observing in the New England Farmer several pieces on raising Fruit Trees, Grafting and Inoculation, I take the liberty to make a few remarks, the result of experience and observation, which, if you think will promote the objects of your publication, you will permit to occupy a corner of your paper.

RAISING TREES. Take a load or more, (according to the size of your contemplated nursery) of fine barn yard dung; spread it on a level place five or six inches thick; on this sow your seeds. As soon as they are up in the spring, and are an inch or two high, which will be about the last of May, having brought your nursery ground into fine tilth, pull up your plants with your fingers, and throw them into a pail of water. Line out your nursery ground. Make holes with a stick, or iron-bar, at proper distances. Set your plants and water each with a gill or half a pint of water; and water them again in three or four days, should the weather prove dry. No covering to the plants is necessary. Pulling them up in this way, you break off the tap-root; and when you wish to transplant them into your orchard, you will find that they have an abundance of lateral, or side roots, but no tap root.

GRAFTING AND BUDDING. It is a maxim with me in grafting and budding to do it as near the root as the stock will allow. For this practice I shall assign four reasons. The first is your scion will be more likely to take, being covered in part with earth. Secondly, should your tree, by any accident, be broken down, you will, nearly always, save your scion.—Thirdly, your scion being partly under ground, will frequently push out roots; and fourthly, the less you have of the old stock, the nearer will the fruit of the scion approach to the fruit of the tree from which it was taken. On stocks of less than an inch, I esteem tongue-grafting much the best. On larger limbs or stocks, what I call bark grafting; on still larger side grafting, on the large limbs not far from the body. Should some of them fail of uniting, you

preserve your limbs for future operations. If they take, some time in June, the year after, saw off the limb close, and give it a good coat of paint, which should be renewed from year to year till it is out of danger from exposure to the weather. If your tree has gotten to a considerable bigness, in order to make sure work, if you can find a good sprout, which grows to the tree, or rather to the root, under ground, graft that, but if you cannot have a sprout, take a long scion, cut a slice of bark and wood from one side eight or ten inches from the butt—thrust it into the ground—cut a slice from your stock to match it. Join them nicely, bind them together, and, as usual apply the clay. It is said that a scion is more likely to do well, if part of the branches are left above it. If so I should suppose that side grafting would be best.

I will now endeavor to point out the methods of grafting, several ways.

Tongue-Grafting.—Clear away all the earth down to the root.—Take off the stock with a keen, smooth knife, aslant from one to two inches, according to its size. Split it down the middle of the slant, the same way you cut it off. Then slant off your scion the same length of your stock. Split that in the same way. The short side of your scion is called the tongue. Slip this into the cleft in your stock, bringing the edges of both carefully together, where you intend they shall unite, bind them close together with bark, apply your clay, and bring the earth round the scion, leaving two or three buds above ground.

Side grafting.—Cut a gash across your stock, through the bark, then let in your knife above, say an inch, bring it down in such a manner that a straight cut will bring the knife to the wood at the cross-cut, which take out; then cut a slit down from your cross cut half an inch, and with the point of your knife, carefully raise the bark a little at the cross-cut. Cut your scion aslant, at the heel of which cut round through the bark, but not so as to injure the wood. Take off the bark thus cut from the lower end of your scion, and insert the flat side of the wood, and press it down, till the square edges of both barks meet. Bind round with bark, then apply your clay.

Bark Grafting supposes your limb cut off square, and smoothed with your knife. Split and raise the bark, as in side grafting—then cut down your scion, two thirds off, on one side with a square shoulder. From this shoulder taper it off to a point on the wood side.—Then cut the remainder of the bark at the shoulder. Take it off with the point of your knife. Insert the point between the bark and wood, with the flat side to the stock, and bring the shoulders together, and bind round with bark, and put on your clay.

FEEDING BEES. Take a slice of good new brown bread, lay it in a plate, and pour on it some wort or new beer, well sweetened with honey and molasses. Set it into your hive in the morning, and you will find at night that your bees have made a good meal. Repeat this as occasion requires.

Maine, April 17, 1824.

So there will be a two fold intention answered: the land will be preserved from washing, while a large amount of hay and winter pasture may be obtained; while the crop of grass may not be any less, in consequence of this graminaceous acquisition. For independent of the waste of soil prevented by the grass, the water from rainy showers which would otherwise escape before the soil could have time to absorb it, will be retained, to the great benefit of the intermediate crop of grain. As winter grass is nearly stationary in the summer, always making its principal growth in the spring and fall, so that it will interfere but slightly, with those annual plants which are the chief object of cultivation.

When small grain is sown between the grass rows, the mixture of good hay with the straw, will add considerably to its value, while the grass seed, if mature, will blow off with the hay.

ABNER LANDRUM.

Edgfield, South Carolina.

AGRICULTURAL INTELLIGENCE.

We are very happy to see, that Agricultural societies not only continue to multiply, but that generally speaking, they seem to be constantly improving in their shows of cattle and domestic manufactures. It gives us sensible pleasure to perceive that the addresses, are every year improving in their business-like character. That while they evince on the part of the writers, cultivation of mind and research, they serve to communicate very useful information, and what more, a taste for reading among the class of society in which this sort of information was not abundant, thirty years since. Farmers have a rare of leisure for reading. It can scarcely be hoped however, that any but the most opulent and intelligent among them will purchase an agricultural library. Yet almost all could afford to pay five dollars to enroll themselves in the Massachusetts Agricultural Society, which will entitle them to receive for life the Journals of this Society, which are published twice year. Thus for a payment equal to one dollar per annum for five years, they become entitled to receive a work devoted to their own pursuits during their lives. Who is so poor as not to be able to afford this? Who so indifferent to the honor, and dignity of his own profession not to be willing to pay one dollar a year for so short a period as five years, to secure to himself and his children such a mass of Agricultural facts?

Grant, if you please, and it ought to be and is granted, that there are many errors, many unground theories, many extravagant statements and new experiments. Yet does this destroy the motives for reading and thinking on such subjects? We think not—an erroneous and absurd theory is tried and found to be so, and proved by a sounder man to be absurd, but it elicits a sound investigation, and often a sound theory and sound practice. The only terms of admission to the Massachusetts Agricultural Society, are a recommendation from some person of known good character that the person applying is an upright, intelligent farmer—and the payment of five dollars to the support of the Journal, for which five times the value is returned, if the member lives to a reasonable age.—*Mass. Agricul. Repos.*

We rejoice to find by a late able address of the Agricultural Society of Maine, that they are rekindling their zeal, and are fully sensible of the importance of the stimulus and direction to Agricultural effort afforded by public societies. It is impossible that Massachusetts should ever be indifferent to the success of Maine. If the ties of consanguinity, of long political connection could be forgotten—entirely forgotten: Yet there would still remain the great and almost unchangeable natural ties of mutual interest. Massachusetts from various causes must be for a century probably, one of the best customers of Maine.—The prosperity of Maine must be highly important to Massachusetts.

We are pleased to see that they have kept pace with us in the importation of new fruits, and that the valuable varieties of pears sent by Mr. Knight, to the Massachusetts Agricultural Society have been at the same moment imported from another source into Maine. May we always thus proceed hand in hand in the advancement of all the arts which contribute to the wealth or the enjoyment of our respective States.—*ibid.*

MANUFACTURES.

We have received from a friend a statement of the Cotton and Woolen Factories, in the County of Worcester, with the number of persons employed and supported by each. We had before no conception of the extent of these manufactures in the heart of our State. The number of Cotton Factories is 21, employing 6050 persons. The number of Woolen Factories is 25, employing 1080 persons. Independently of the above, the Smithfield Factory, owned by Almy, Brown & Slater, supports 1500 persons, and the Pawtucket Factory, belonging to the same concern, employs 1000. The Ludlow Factory, in which Mr. Slater is concerned, also supports 1000. The Messrs. Slaters give employ to hundreds of Store-keepers, who send their wagons to take the yarn, colored and white, which they give out into farmer's families, forty miles distant, where it is woven into checks, stripes, ginghams, bed-ticks, shirtings, sheetings, &c. and they are paid in W. I. goods, cotton yarn, &c.

There are several considerable Machine shops in the town of Worcester, which occupy all the water power upon the small stream Blackstone, (passing near the Coal Mine) and employ about 150 persons; and there are in the county more than fifty Machine shops which go by water, and employ more than 500 workmen. The whole town of Leicester is employed in Machinery and Card making. Fifteen hundred women and children earn a good living at this business.—*Sal. Reg.*

Effects of Fear.—In the time of the American revolutionary war, while the army was encamped at West Point, a party of soldiers discovered an eagle's nest, half way down a precipice, adjacent to the fort. To get at the nest, a soldier was let down by a rope, fastened round his middle. When he had descended near to the nest, the eagle came upon him with hideous screams, aiming at his head: he had no way of defending himself, but by taking out his knife with which he kept her off by striking at her. In one of the passes he made at her, he had the misfortune to strike the rope, and cut one of the strands entirely off; the other strand began to

be untwisted, while his companions drew him up as soon as possible: in this situation he expected the rope every moment to part, when he must have fallen from the tremendous height among the rocks; but he was drawn up to the top of the rock, when the remaining strand of the rope was nearly reduced to a wisp of tow. In the course of 21 hours, the hair of his head, from a coal black, was turned as the whitest wool! He was 25 years of age.—*Eos M.d. lat.*

To make Transparent Soap.

Suet is the basis of all the soaps of the toilette, known by the name of Windsor soap, because olive-oil forms a paste too difficult to melt again, and contains an odour too strong to be mixed with essences. The suet soap dissolved hot in alcohol retakes its solid state by cooling. To this facts is due the discovery of transparent soap, which, if well prepared, has the appearance of fine white candied sugar it may also be colored, and the vegetable hues for this purpose, are preferable to mineral; any person may make this soap, by putting in a thin glass phial, the half of a cake of Windsor soap-shavings; fill it with one half of alcohol, and put it near the fire until the soap is dissolved; this mixture placed into a mould to cool, produces the transparent soap.—*American Farmer.*

The following Receipt for batts was furnished us by W. D. Taylor, Esq. of Taylorsville.

Half pint of elder juice, extracted from the leaves; half pint of linseed or any other oil; half pint of water, with a small piece of alum, making a quart drench, which will ensure relief in fifteen minutes.—*ibid.*

Steam Boat Disaster.—The Baltimore papers received yesterday announce a distressing accident having occurred to the steam-boat *Eagle*, Capt. WEEMS, in her first trip from Annapolis to that city. In the evening, when off North Point, her boiler burst, killed one passenger, name unknown, and scalded four others, among whom was H. M. Murray, Esq. an attorney at law of Baltimore; the latter but slightly. The Captain and all the crew were more or less injured; and only three of the passengers escaped unhurt. A son of the Captain was blown through the cabin skylight, and yet without serious injury. The *Eagle* was set on fire, but it was soon extinguished. The *Constitution* steam boat, Capt. ROBINSON, spoke the *Eagle* in her distress, was immediately put about, afforded every relief, and towed the disabled boat into Baltimore. The hull of the boat was not essentially injured, but the machinery considerably. Four of the passengers have returned public thanks to Capt. ROBINSON for his kindness and prompt attention.

The *Eagle* had cast iron heads in her boiler. Capt. R. is of opinion that if no vessel had gone to the relief of the *Eagle*, she would have burned to the water's edge, and every soul on board must have perished. The wind was blowing hard at the time, and the *Eagle* was a complete wreck below deck. A soldier was killed in the forward cabin.

A Beaver Hat has been manufactured by Mr. J. Hurley of New-York, and intended as a present to Gen. LA FAYETTE. It is said to be one of the finest specimens ever seen in this or any other country.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.
No. II.

The conduct of the British nation, in cases of a competition of any of its manufactures with a foreign one, is so different from that of the United States, and particularly in the case of the bonnets, that it ought to be known. The following account is given from the 40th vol. of the Transactions of the Society of Arts of London, for the year 1822.

A Friend to Agriculture, Commerce and Manufactures.

NEW MATERIAL FOR STRAW PLAT.

The large silver medal and twenty guineas, were this Session given to Miss Sophia Woodhouse, (Mrs. Wells,) of Weathersfield, in Connecticut, United States, for a new Material for Straw Plat. Samples of the Straw in its raw, bleached, and manufactured state, have been deposited in the Repository of the Society.

During the late war the importation of hats and similar articles for female wear, manufactured of the fine straw grown for this purpose, and known in the market by the name of Leghorn plat, was almost entirely put a stop to. The consequence of this was, an extraordinary degree of encouragement to our domestic manufacture of plaited straw, and a proportional degree of ease and comfort hence derived, by the agricultural labourers of Bedfordshire, Hertfordshire, and Buckinghamshire, by the wives and children of whom this profitable occupation was chiefly engrossed. Competition naturally led to an improvement of the fabric by splitting the straw, which had heretofore been used entire, and by more accurate selection of the straw itself and more effectual methods of bleaching. At the conclusion, however, of the war the trade of the country fell into its usual channels and bonnets and hats of genuine Leghorn plat soon found their way into our markets. The Leghorn straw being much slenderer than that of English growth, may be employed entire for the finest articles, on which account the plat is rendered more even, pliable, and durable than that of equal fineness made from split straw: it is also greatly superior in color. A further advantage is, that the spiral coil of Leghorn plat of which a hat or bonnet is formed, admits of being joined by knitting the adjacent edges together instead of overlapping and sewing them, as must necessarily be the case with the English plat: on account of which difference of construction, the Italian bonnets and hats are of the same uniform thickness, whereas, the English are an unpleasant alternation of ridges and depressions, and require, besides, a considerable greater quantity of plat. These real grounds of preference, independently of the caprice of fashion, soon began to operate unfavorably on the English straw plat, and in a short time put an end to it as far as regards the finer fabrics.

Another cause also has operated in producing the depression of this manufacture, namely, the greater cheapness of labor on the continent in comparison with England. The best Hertfordshire straw may be, and actually is sent to Switzerland, where it is platted, is then returned to England, paying an import duty of 17 shillings per pound, and may, after all, be sold at 25 per cent. cheaper than plat made in this country.

Such being the state of things the society received with much pleasure a communication from Miss Sophia Woodhouse, the daughter of a farmer residing at Weathersfield, in the State of Connecticut, stating that she had manufactured some bonnets in imitation of Leghorn, from the stems of a species of grass growing spontaneously in that part of the United States, and popularly known by the name of *Tickle-moth*.—The communication was accompanied by a bonnet of her manufacture, and a few dried specimens of the entire grass. The bonnet being submitted to the inspection of the principal dealers in such articles, was declared by all of them to be superior even to Leghorn in the fineness of the material and the beauty of its color; and that the introduction of straw to this country, either by importation or growing it here, would probably be of public advantage, by supplying a raw material superior to any other, and which probably may be manufactured to great advantage in those parts of Great Britain and Ireland where labor is cheap.

The reward mentioned at the head of this article was, in consequence, voted to Miss Woodhouse, on conditions which should put the Society in possession of some seed of the grass, and also of the process employed by the candidate to bleach the straw. Both these conditions have been complied with; the seed received has been distributed during the summer of the present year, to various persons in Great Britain and Ireland, and has germinated very successfully, both under cover and in the open air. In the latter situation it has thrown up a thick mat of long and fine herbage, but has not flowered, it is therefore probably perennial; and if it endures our winters, will, in all likelihood, prove a valuable pasture grass.

The treatment of the stems for the purpose of manufacture, is thus described in the words of Miss Woodhouse herself:

Weathersfield, Conn. Dec. 20, 1823.

I regret that the proper season for cutting the grass had elapsed before I received the communication from London. The small quantity which I had previously gathered, I transmit herewith to the Society. Part of it is prepared for plating. It may be considered as a specimen of the usual fineness of the grass, as it has not had a straw, coarse or fine, selected from it.

I am able to give no account of the method of cultivation having never known it cultivated in this country. It grows spontaneously and abundantly in our meadows. It is more common in fields that have not been highly manured, but that are rather reduced in strength and richness of soil; in a few fields it has been observed, that gypsum and manure have destroyed this grass and introduced clover.

I am able to procure but little of the seed.—As it has never been sown in this country, very little of it has been preserved.

I have prepared it for manufacture in the following manner:—I have cut it in the fields from the time of its flowering, until the seed is nearly matured; that part only is used, which is between the upper joint and the top or panicle; on this I pour boiling water and then dry it in the sun; this operation I repeat once or twice, or until the leaves which sheath the stem come off. I then bleach it, but for this purpose I have used no other apparatus

than what every farmer's house furnishes. In the first place I prepare some soap and water, in which I dissolve pearl ash until it can be tasted; in this solution I moisten the grass, and then set it in an upright position in the bottom of a cask; I then burn brimstone in the cask by means of a small heated kettle or dish of coals, and close the cask at the top with blankets so as to confine the smoke. This fumigation I continue until the grass moistened by the solution of pearl-ash, &c. becomes dry, which will require about two hours. During this operation, the kettle will generally require to be reheated, or the coals to be replenished once or twice. The grass is now ready for plating.—After this is performed and the bonnet is sewed together, I fumigate it again with brimstone in the same manner as before, being careful to place the bonnet in a situation in which it will be penetrated by the smoke; the bonnet is now finished by pressing, for which purpose, I have used only a common smoothing iron. The only caution necessary in this operation is, not to have the iron heated so much as to scorch the grass.

SOPHIA WELLS.

(To be continued.)

From the New Bedford Mercury.

LOCUST TREES.

MR. LINDEY.—You will particularly oblige some of your readers by giving publicity to the following directions for preparing and planting the Locust Seed. Want of information on the subject has caused the neglect which has taken place, in the cultivation of this valuable tree.—This method may be depended upon, as it was derived from a source of high respectability on Long Island.

DIRECTIONS.

Put the seeds into a vessel over night, pour hot (not boiling) water on them. In the morning, take them out and spread them—select those that have swelled, for planting; return the remainder into the vessel, repeating the same process the following, and so on for two or three successive nights; taking care each morning to separate the swelled seeds from the others. What remain will probably be imperfect.

Sow or plant the swelled seeds in rows three feet apart, on good ground, about the time of planting beans—to be hoed and dressed the same as beans.

They are very tender when young, and slight frosts will greatly injure, if not kill them.

A correspondent at Little Compton informs us, that a person in that place came near losing a valuable Cow, by her having got a large piece of turnip in her throat, which she could not swallow. Various ways were tried to extract the turnip; but the only practicable method was to cut a hole and take it from her windpipe. The wound was carefully closed up, and the cow fed on corn and potatoes, with a little hay; and is now entirely recovered.—*Ibid.*

We should be glad to know if the following remedy was tried:

Take a quart of water, a little more than milk warm, and put in it a large spoonful of soft soap, and stir it well, and turn it down the animal's throat, about one third at a time. This by causing the throat to be slippery enables the creature to dislodge the root or other substance. See N. E. Farmer, vol. i. page 256.

BIRD SHOOTING.

Easton, Pa. March 26.

The approach of mild weather has brought with it that most charming delight of the season, the music and twittering of the smaller birds—but it is no trifling deduction from the pleasure it affords, to hear the surrounding hills reverberate with the reports of guns that vanton insensible persons are aiming at their ves. Perhaps no amusement (if it deserves that name) is so lame in defence as this. Few are willing to acknowledge themselves hard-hearted or savage enough to be pleased with the dying angings of a poor beautiful little bird, which can answer him but a trifling purpose after it is dead; and as an economical mode of procuring food, it is wholly indefensible, for the cost of powder and shot, used by the most expert gunner, (unless on a chance occasion,) would procure double or treble the weight of good fat mutton or beef, at the butcher's stall, as he can possibly obtain in birds—and if their little limbs be a delicious variation for his palate, yet he must owe an inharmonious soul who can exchange their continued heavenly notes for such a momentary gratification. The exhibition of skillful shooting, or practising to attain it, is a poor plea. Our riflemen in the absence of Indians and bears, content themselves with shooting at a square inch of paper, and sleep just as soundly afterwards as if they had taken a dozen slugs; and so might one of your blue bird gunners.

But the destruction of a robin, chip, blue, or lark bird, is not all; with every individual of the sporting wretch destroys at least a bushel of corn, apples, or other fruit; for in the course of the season, each bird devours as many caterpillars and other insects as would by the use of the ingathering prevent the earth's productions to the amount: and no doubt to such use is to be attributed the enormous increase of marauding insects which the papers from every quarter detail through the summer season:—however, it serves the sufferers right; they could prevent it in nature's way.—So extensive is their destruction been, that the many beautiful summer walks adjoining this town, have been deprived of half their sweetness, in the almost total absence of birds which formerly abounded, and their place occupied by swarms of caterpillars on the ravaged ragged looking trees.

The game laws of England and other places are subjects of great scorn in this country; and perhaps much cannot be said in defence of the reasons for their adoption that would be agreeable to republican notions, as it was, undeniably, to reserve that sport for the richer classes; though all may partake by purchasing licenses at specified times.—Nevertheless they are attended with immense advantages to the farmer. The smaller birds are abundant, and we do not remember ever to have seen an account of extensive destruction by insects in that country; which add the preservation of their crops from the wandering feet of wanton gunners, the gaiety of their dwellings from the music of the little songsters; for we would never see ten dozen gunners toiling on the mud wheel, than forego this last consideration. It is urged by the sportsmen that if they do not others will! Though this is no excuse to them, yet let adjoining farmers unite to prevent any perseveringly prosecuting every one who clears their premises on that errand.—No one

has a right to shoot on any land without the owner's leave, and are also fineable for so doing within a considerable distance of any public road. In parts of Bucks County and elsewhere this is done, and the farmers find their accounts bettered by it,—neither do so many accidents happen by leaving loaded guns standing about the house.

We do not mean to say there may not be proper times for shooting, though it should be confined to a season; and perhaps hawks, crows, &c. are lawful prey at any time.

From the American Farmer.

ON MILK AND ITS PRESERVATION,

With reasons why the portion least drawn from the cow is always the richest.

At a late sitting of the Glasgow Philosophical Society a memoir was read by Mr. Maclure, a surgeon, in which he presented a simple but satisfactory explanation of the well known fact that the milk which is obtained towards the conclusion, is much richer than that which the cow yields at the commencement of the milking process. The dairy-maid calls it the stripings or afterings. His theory is this: He considers milk in the udder of an animal, as being nearly in the same circumstances as milk contained in a vessel out of her body altogether.—It is without the pale of the animal's secretion, and nearly in a state of absolute rest. Its component parts, therefore, will obey the same laws in the one state as in the other. Now the cream, which is the lighter and more oleaginous part of milk, ascends to the surface of that which is contained in a vessel, becomes supernatant, and leaves the more watery and heavier portion below. In like manner, because the part called afterings, which resembles cream, is specifically lighter than the more aqueous portion of milk in the udder, it ascends to the upper region of that organ, and consequently is the last which is expressed during the process of milking.

The following method is recommended for the preservation of milk, either at sea or in warm climates:—"Provide pint or quart bottles, which must be perfectly clean, sweet and dry; draw the milk from the cow into the bottles, and as they are filled, immediately cork them well up. Then spread a little straw on the bottom of the boiler, on which place bottles with straw between them, until the boiler contains a sufficient quantity. Fill it up with cold water; heat the water, and as soon as it begins to boil, draw the fire, and let the whole gradually cool. When quite cold, take out the bottles, and pack them with straw or saw dust, in hampers, and stow them in the coolest part of the ship, or in a cool place. Milk preserved in this manner, has been carried to the West Indies, and back again to Denmark; and although it had been eighteen months in the bottles, it was as sweet as first milked from the cow.

NEW WHEAT.

Extract of a letter from Hon. Jonas Seely, Esq. a member of the Legislature, to an agricultural gentleman in this country.

ALBANY, 6th Feb. 1824.

"SIR,—In answer to your request on the subject of a new kind of wheat, lately cultivated in Seneca county, I really consider it a great

acquisition to our country. It resembles in color the bearded thorn wheat, the berry rather smaller than the white or red chaffed wheat, and weighs from 62 to 64 lbs. a bushel. I have made experiments, and have given it a fair trial on different soils, from clay loam to a black rich soil. It possesses two very important properties which our common wheat does not. It resists frost much better, and is absolutely invulnerable to the attack of the Hessian fly; this was abundantly proved the last season. On this account alone it is invaluable, as I had fields of common wheat nearly destroyed by the fly, while this new wheat side by side was untouched.

The common wheat when not injured by fly or frost will produce some more per acre. The new wheat grows thick on the ground, the color of the straw is lighter and softer and does not grow as tall as common wheat, the heads are shorter but fill well, the chaff is light. The flour is equal to the common red berried wheat. I sold 70 bushels of it to Col. Mynderse, at the Seneca Falls, last December, his miller pronounced it the finest lot of wheat he had purchased since harvest; it was sowed the 17th September, 1822. It was first introduced into Seneca county 5 or six years ago, and is called beaver dam wheat, under an idea it was first brought from a beaver dam near Utica, whereas, Col. Mynderse informed me that it was imported from Spain by Elkanah Watson, Esq. of Albany, and was one of the various samples of wheat he distributed over the country 6 or 7 years ago."

It is hoped the printers of newspapers throughout the state, will, for a moment, take a breathing spell from the busy strife of politics, and occasionally turn an eye to the best interests of our country, viz.: agriculture and domestic manufactures. A general communication of the above important information cannot fail to promote the general good.—*ibid.*

EFFECTUAL CURE FOR THE BOTTS.

TO THE EDITOR OF THE AMERICAN FARMER.

SIR,—In the American Farmer I have read with interest, several remedies for the botts. It is certainly desirable, if possible to obtain some specific, which may be relied on, to expel those terrible insects when actually formed in the stomach, as well as to prevent their formation. As one of your correspondents observes there is no doubt that salt exhibited weekly in the food of horses, would assist as a preventive; and so will salt petre and assafetida occasionally administered.—Carrying and cleaning the hair of the horse is necessary not only for the good appearance, but also for the general health of our favorite animal.

Of all the remedies I have used and seen used to expel the botts, fish brine is decidedly the most efficacious and sure. I have saved several valuable horses, after they were actually stretched on the ground, and apparently in the last agonies.

Let a quart of salt fish brine be administered at once; and the dose be repeated in an hour afterwards, unless previously there be symptoms of relief. The medicine will show its effects in copious discharges from the relieved animal, which will be accompanied by quantities of dead botts. He will not only be relieved, but will be improved in his health and condition. It is to be observed, by the by, that all owners of horses would do well to give them occasionally in their food, and sometimes in draught, small quantities of fish brine.

E. H. CUMMINS.

NEW ENGLAND FARMER.

SATURDAY, MAY 1, 1824.

FARMER'S CALENDAR.

FLAX is not so much cultivated in New England as it should be, notwithstanding many able essays have been written recommending it to the attention of our agriculturists. We shall give a few brief observations, stating the most approved methods of obtaining this crop, and refer our readers, who wish to avail themselves of more detailed information to the able essays of S. W. POMEROY, Esq. republished in the 2d vol. of the N. E. Farmer, pages 26, 36, 44.

Flax should be sown on a moist, cool and rich soil. The land should be made quite fine, and free from weeds, and therefore no new dung should be laid on it at the time of sowing.— Fresh dung causes weeds to multiply till they nearly or altogether stifle the crop. Besides, barn yard manure, applied the same season in which the crop is raised, not only occasions weeds to infest and choke the flax plants, but induces the plants to lodge, and gives them a thin harle. Lime, marle, and leached ashes are recommended. Your seed should be of the last year's growth. It should be "plump, oily, and heavy, of a light brown color, sinking readily in the water, and, when thrown into the fire, should crackle and blaze quick. A very simple method of trial is to sprinkle it thin between two pieces of wet paper, which plunge into a hot-bed or dung-hill, and in less than twenty-four hours the proportion that will vegetate can be discerned."

With regard to the quantity of seed to be sown, there has not been, and perhaps ought not to be, any uniformity of practice. In England they sow two bushels of imported seed to an acre. When they sow seed of their own raising they allow more. If you wish to obtain very fine flax, your seed should be thickly sown from two to three bushels to an acre, will probably prove the proper quantity. But if the raising of seed is an object about a bushel and a half will be the right proportion. "In this country," says Mr. Pomeroy, "it will be important, at present, to sow at such a rate as will ensure good crops of each; and experience only can determine the exact point. It is probable that six pecks is the least, and two bushels the extent that should be sown to obtain the most profitable results, till the demand for seed is considerably lessened."

The Farmer's Assistant asserts that "in addition to the requisites of a rich earth free of the seeds of weeds and well fallowed, for obtaining a good crop of flax, another requisite is that the ground shall not have borne flax for as much as seven years previous to the time it is to be sown with this crop." The same author says, "when ground is folded for raising turnips, instead of sowing this crop for the first year, let it be frequently ploughed in order to kill all the weeds, and sown early with flax the next spring and then with turnips after the flax is taken off."

Salt as manure is recommended by many writers as particularly favorable to the growth of the flax; the quantity applied to be about double to that of the seed sown. In the *Memoirs of the New York Agricultural Society*, vol. ii. page 22, ashes are recommended as the best manure for flax. "The seed should be soaked about

half an hour in weak lye, or rather in strong lye diluted with six times as much water. If it is taken wet from the lye and rolled in plaster it is better. Let it be sowed on land well ploughed twice and harrowed, which had been planted with potatoes or corn (potatoes preferable) the preceding year. Just as the flax is coming up, sow on two or three bushels of strong ashes per acre."

OATS. Every farmer who keeps horses should raise some oats, enough for home consumption at least. Nothing, we believe, is equal to them as food for horses, as they serve in some degree as well for physic as for food. They are, likewise, when manufactured into oat meal, said to be an excellent article for human sustenance, and although not so palatable at first, with a little use are by many preferred to the best wheat flour. Many farmers find it to be a good mode of cultivation to raise oats the first crop, after breaking up the sward. The oats have strong piercing roots, and penetrate the earth in such a manner that it is easily made mellow when the roots of the oats decay. Gypsum is a good manure for oats. It may be sown soon after the oats are harrowed in. Dean's New England Farmer directs the sowing of three bushels of seed oats to an acre. The Farmer's Assistant says, "probably about a bushel and an half is sufficient." Banister's Husbandry says "from three four bushels is the quantity necessary to seed an acre, allowing a larger proportion to the poor lands than needs be sown on those of a more fertile nature." The same writer observes that "where land is intended to be laid down with clover or other grass seeds, it is much more eligible to sow these seeds among oats than on ground sown with barley; for since the land ought to be well prepared both by manure and tillage previous to laying it down to grass seeds, such extraordinary cultivation will be apt to cause the barley to lodge, when the grass will grow through it, and render it of little worth; or if this accident should not happen, the length of the clover will occasion an extraordinary humidity in the barley, that a longer time will become necessary for its lying abroad, whereby great injury may accrue to the grain, if much rain should fall during this procrastinated harvest. These objections do not apply to oats in the like predicament; for the straw of this grain being much stiffer and less porous than that of barley, is enabled to maintain an erect posture against that weather, which would have laid flat the barley crops; and if from the extraordinary length of the grass it should be necessary to prolong the harvest, the oats will take but little injury, though a wet time should happen whilst they lie in the sward."

Oats are reputed to be a very good crop for ploughing in green for manure. Two crops of oats have been ploughed in, the same season, and produced a very good effect. They are, likewise, sometimes sowed for pasture, and the practice has been highly recommended by respectable cultivators.

THE UNITED STATES LITERARY GAZETTE. The first number of a periodical work, with the above title has been published by Messrs. Cummings, Hillard & Co. No. 1, Cornhill, Boston. From a cursory perusal of this number, we are led to favorable anticipations of its progress, provided it should meet with that degree of public patronage, which is indispensable in order to

give permanency to literary efforts, particularly those of this description. The following extract from the Prospectus develops the plan of the publication, and the means, which are relied on to carry its objects into effect.

"We shall endeavor to give to the United States Literary Gazette, a strictly national character. If we do not fail in executing our intentions, it will communicate a distinct and accurate impression of the literary and intellectual condition and progress of this country. A large proportion of our pages will be filled with reviews of works published here, either of domestic or foreign origin; every book which issues from the press of this country, and comes within our reach, shall receive from us such notice as its character and pretensions deserve. We shall also publish whatever interesting information we can gather, concerning our national literature, education, and public opinions.

"Some pages of each number will be filled with *Literary and Scientific Intelligence*. Great care and assiduity will be used to ensure to this department of the Gazette interest and value. It may be well to remark, that our extensive connexion with booksellers at home and abroad, will enable us to supply our editors and contributors, promptly, with almost every new publication of the kind."

The work is to be published the first and fifteenth day of each month in a quarto form, each number containing 16 quarto pages. The paper, type and execution are of the best quality. Terms—\$5 per annum. Subscriptions received by the publishers.

FOREIGN.

Spanish papers to the 11th March have been received in this city, but contain nothing interesting. Accounts from Barcelona state that the Algerines were fitting out vessels to deprecate on the commerce of the British, and that they had taken several Spanish vessels. The port of Algiers is closely blockaded by British squadron.

An article dated St. Jago, Chili, Dec. 15, 1823, states that there are several Spanish privateers on that coast, one of whom is said to have captured the English ship Stanmore, chartered by the Chilean East India Company, and said to have \$50,000 in specie on board, and an equal amount in cargo. A Chilean frigate has sailed in search of her, and it is added that the United States ship Franklin, Com. Stuart, has also sailed in quest of her; as it is said that the Stanmore had the American Consul at Coquimbo, on board, and that he has been detained.

Gen. La Fayette has lost his election to the House of Deputies in the Department of La Sarthe. At the last election he was returned from two places.

From Brazil.—An arrival at Salem from Para, confirms the accounts of the evacuation of that place by the Portuguese and other Europeans, in consequence of the approach of 15,000 of the natives to the possession of the city. On board one vessel 192 merchants, &c. embarked for Lisbon.

From Porto Bello.—Capt. Bossierre, from Porto Bello informs that a letter had been received there from Panama, dated March 26th, giving information of the arrival there of a vessel from Callao, with advices, that the Royal Spanish army had made propositions to Bolivar to capitulate, on condition of being sent to Panama, and thence to be expedited to Europe.

An arrival at New York has brought French papers to the 25th March. By those it appears that the French government are about to acknowledge the independence of Hayti, and open a commercial intercourse with the late Spanish South American States.—The new French Parliament was opened by the King in person. His speech was pacific, but as usual on such occasions, rather indefinite. Respecting Greece and South America, he observed, "I trust that the affairs of the East and of Spanish and Portuguese America will be regulated to the advantage of the nations, and people who are interested, and to the great extension of the commercial relations of the world." The speech was received with lively and reiterated acclamations.

London dates are received to the 20th March, but contain nothing of much interest.

The last advices from Greece continued favorable to that country. Tatros was expected to surrender shortly. Lord Byron had adopted a Greek dress, and marched with a corps against Lepanto. It was reported that the Pacha of Scutari had raised the standard of rebellion against Turkey, and declared his intention of making a common cause with the Albanians and fellowes. Several English officers of merit had recently arrived in Greece, and also several cargoes of munitions of war.

Accounts from Constantinople to Feb. 12th, contradict the report of peace having been ratified with ersia, and state that the Turkish Army had recently been completely defeated, in the neighborhood of Bagdad.

It was reported at Genoa, March 6th, that the Algeres had taken 10 Spanish vessels, and had landed on the coast of Valencia, and carried off 47 persons, men, women and children.

DOMESTIC.

Mr. Thomas Story, of the city of New York, has appeared and placed for inspection at the office of the Commercial of that city, a model, which is to supercede the crank motion in our steam engines. This invention, says the Editor of the Commercial, will transfer the power unimpaired from the piston of a steam engine, to the water wheel of a steam boat, in a perpendicular line, without variation, and will cause a saving of nearly 50 per cent of the power of the engine which is now lost, by the manner in which the power is transferred through the irregular agency of the crank, or the crank motion.

The advantage it possesses over the crank and crank bar now in use in steam engines, is explained by Mr. Story as follows: Suppose a boat has a steam engine, with a cylinder of 30 inches in diameter, equal in power to 30 horses; this engine can raise on its piston 5600 pounds; but by the agency of the crank and crank bar, now in use, it cannot transfer to the wheel axle-tree more than an average power of 20 pounds; whereas this substitute can transfer 50 pounds, from the piston of the same engine, and same time.—Philadelphia Register.

St. Louis, Missouri, March 29. Lt. Morris, of the Council Bluffs, brings news of the murder of five men belonging to the trading establishment of Messrs. B. & Co. by the Yoncons, and one of the Columbus Fur Company, by the Rickare Indians.

An article, dated Indianapolis, March 30, gives a detailed account of a very barbarous murder, committed by a party of white men on some Indians encamped at all Creek, Madison county, for the purpose of hunting. The Indians were ten in number, consisting of the men, three women, two girls half grown, and two small boys. Five white men and two boys went to the camp and decoyed the three men away from the camp on the pretence of assisting them to hunt for some deer. Two of the Indians were shot dead by the white savages; the third made his escape badly wounded. The murderers returned to the camp, and making professions of friendship, killed the women and children, with circumstances of the most atrocious cruelty. One of the lads, concerned in the murder, having been compelled to assist by his father, was informed of the horrid transaction, and five of the seven concerned in the murder were arrested. The families in the neighborhood have removed from that vicinity to avoid the vengeance of the Indians.

Professor Everett is appointed to deliver the Oration on the Phi Beta Kappa Society, of Harvard University, at their next anniversary.

The Boston Recorder of Saturday last, contains a list of battles fought in the United States, or by citizens of the United States, since the commencement of the present century, to the number of a hundred and four, in the greater part of which one of the parties was killed and in several of them both were killed.

Volating the grave.—A trial of a novel character has taken place at the present session of the Supreme Judicial Court, in Worcester, upon an indictment against

a young medical student, for disinterring a dead body. He was found guilty, and sentenced to two months imprisonment, and to pay costs amounting to about \$250.

CONGRESSIONAL.

In SENATE.—Friday, April 16. Mr. Lloyd, of Mass. gave notice that on Monday next he should ask leave to introduce a bill "to provide for the punishment of certain crimes when committed in any Navy Yard, fort, arsenal dock, light house, tract of land, or other place belonging to the United States."

The additional bill relative to making the returns of the election of President and Vice President was further discussed; amendments made, and the bill passed to a third reading.

Monday, April 19. A resolution for fixing on the 15th of May for the adjournment of Congress passed to a third reading. Yeas 25, Nays 21.

The new Tariff Bill from the House was read for a first time.

A resolution passed, requesting information respecting loans of money made during the late war, under the condition of applying them to the defence of the State to which such loans were made.

Tuesday, April 20. Mr. Lloyd, of Mass. asked leave to introduce a bill (mentioned above) for punishment of crimes, &c.

The Tariff Bill was read a second time, and Mr. Lloyd, of Mass. moved that it be referred to the Committee on Finance. After debate, this motion was negatived. Yeas 22, Nays 23. The bill was then referred to the Committee on Commerce and Manufactures.

Wednesday, April 21. The Senate concurred in a resolution from the House for the appointment of a Joint Committee to report what business is necessary to be acted on at the present session, and when the two houses may adjourn.

House.—Friday, April 16. A memorial of the Cherokee Deputation, representing their unwillingness to abandon their homes, declaring their determination to pursue agriculture, manufactures, and the mechanic arts, and praying protection, was received and ordered to be read.

A memorial from sundry inhabitants of Washington, praying the establishment of a National Paper Currency was referred to the Committee of Ways and Means, and ordered to be printed.

The bill respecting the Slave Trade was reported and read twice.

The Tariff Bill was again discussed, and at length the main question "Shall the bill pass?" was put and decided in the affirmative. Yeas 110, Nays 102.

Monday, April 19. The Speaker presented a long address from Ninian Edwards, of Illinois, late a Senator of the United States, and recently appointed Minister to Mexico, vindicating himself from certain allegations made by the Secretary of the Treasury, in a late report to Congress in relation to government deposits in the Western Banks. This caused warm debate, and at length a Committee of seven was appointed to investigate the subject.

Tuesday, April 20. On motion of Mr. Taylor a Committee of five were appointed on the part of the House to join a Committee of the Senate to report what business ought to be acted upon the present session, and when the session may be closed.

Mr. Cocke moved to strike out the appropriation of \$50,000 for a fortification on Naraganset Bay, in Rhode Island. This occasioned a long debate, and the motion was negatived. Yeas 62, Nays 121.

Wednesday, April 21. A bill to allow bounty on vessels employed in the Cod Fishery, in certain cases, was read twice.

The joint resolution of the Senate, fixing on the 16th of May for the recess of Congress was read twice, and after debate referred to a Committee.

The House refused to take up the bill authorizing the building of additional sloops of war.

Mr. Floyd, from the Committee to whom was referred the Memorial of N. Edwards, before mentioned, communicated from the minutes of the Committee a vote to require the attendance of said Edwards, to be examined on the matters contained in his Memorial; and that the Chairman do move the House, that information of the votes of the House thereon, and of the foregoing resolution of the Committee, be communi-

cated to the President of the United States. This motion, after debate, was agreed to.

NEW GARDEN SEEDS.

JUST received by the London Packet, and for sale by GEO. MURDOCK, No. 14, Market-square, an assortment of GARDEN SEED, of the last year's growth, among which are, Early and Late Cauliflower, Early and Late Cabbage, Early and Late Peas, Sweet Marjoram and Thyme, ARMACK, MANGEL WARTZEL, KUTA BAG A, &c. *Likewise*—a few cases of MARASCHINO and CURACOA, a Cordial much celebrated in Europe—French Anniseet in baskets of 2 bottles each—Welch's No. 1 Chocolate, Cocoa and Shells—green Madeira Citron, with other Groceries as usual.

Likewise—a few Hampers of Rich Cheshire and Loni Cheese—London Brown Stout, in whole and half Bottles—English and French Mustard, in kegs and jugs.

March 27.

6w

NOTICE.

MR. HALL J. KELLEY, *Engineer and Teacher of Mathematics*, will be in his Office, No. 64, Market-Street, between the hours of 12 and 2 o'clock, P. M. April 17.

WANTED Nos. 14, 43, and 45, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper.

From the New-York Evening Post.

Whoever can read the following lines without being sensibly touched by their unusual beauty, possesses no feelings in common with me.

FADED HOURS.

BY J. R. SUTERMIESTER.

Oh! for my bright and faded hours,
When life was like a summer stream,
On whose gay banks the virgin flowers,
Blushed in the morning rosy beam—
Or danced upon the stream that bare,
Its store of rich perfume along—
While the wood robin poured on air,
The ravishing delights of song—
The sun looked from his lofty cloud,
While flowed its sparkling waters fair—
And went upon his path way proud,
And strew a brighter lustre there—
And smiled upon the golden heaven,
And on the earth's sweet loveliness,
Where light and joy and song were given
The glad and fairy scene to bless!
Aye, these were bright and joyous hours,
When youth awoke from boyhood's dream:
To see life's Eden dressed in flowers,
While young hope basked in morning's beam,
And proffered thanks to heaven above,
(While glowed his fond and grateful breast)
Who spread for him that scene of love,
And made him so supremely blest.
That scene of love—where hath it gone?
Where hath its charm and beauty sped?
My hours of youth that o'er me shone—
Where have their light and splendor fled?
Into the silent lapse of years—
And I am left on earth to mourn!
And I am left to drop my tears
O'er mem'ry's lone and icy urn!
Yet, why pour forth the voice of wail,
O'er feeling's blighted coronal?
Ere many gorgeous suns shall fail,
I shall be gather'd in my pall.
Oh! my dark hours on earth are few—
My hopes are crush'd—my heart is ruin—
And I shall soon bid life adieu,
To seek enduring joys in heaven!

Rincheck, 1824.

Miscellany.

Translated for the Charleston Courier, from a French paper.

THE DOG OF COGNIOU.

A paper merchant established at Marseilles, went in 1718 on a journey to Toulon, and was assassinated on his return in the wood of Cogniou. Notwithstanding the strict enquiries made by the son and widow of the deceased, they could not fall upon the track of the murderer.

Six months thus passed away, about which time the merchant's son entered one day a coffee-house, where several persons were peaceably assembled. Immediately his father's dog, that had accompanied him, sprung with fury upon a tall lean man who was enjoying the company of ladies. Astonished at this sudden attack, every one rushed forward to restrain the furious animal—they beat him with sticks, strove to draw him off by force—but all in vain—the dog redoubled his rage, and continued to bite his victim, who was pale with fright.

They then applied to his master, who with the utmost difficulty made him release his prisoner, and could only do so by quickly leaving the place, when the dog followed him. But having gone about a hundred steps, the animal returned re-entered the coffee-house, and again sprung upon the man.

There was at this alarming scene, an individual who had been connected in business with the deceased—and he asked the son, who was struck with amazement, if his father had not that dog with him on his melancholy journey to Toulon. Yes, replied the son, he returned to the house long before we had intelligence of the calamity which has ruined us.

During this private conversation, the master who had seized a cord and fastened it round the dog's neck, was holding him with difficulty—when his friend added—If I do not deceive myself, that man is the murderer of your father—remain while they are discussing the adventure, and I will go to the commissary for a guard.

Returning soon after he arrested the individual suspected, and conducted him to prison. On searching him, they discovered the merchant's watch and other jewels, of which he had deprived the unhappy man. It was proved besides, that on the day of the murder, the accused had been seen by a girl coming out of the wood of Cogniou. And these proofs, strengthened by other circumstances, condemned the accused, who avowed his crime to the confessor on the scaffold.

The following fact is gravely stated by a late English Traveller, and no doubt but as gravely swallowed by his English readers. "One thing at least I must speak of, on account of its extraordinary nature; the Americans, I forgot the year, in order to destroy the Dutch shipping in the Texel, conveyed three several casks of a peculiar worm, which they emptied into those waters; the result was, that they ate their way into the hulks of the vessels, which in a short time became completely rotten. A piece of the timber thus rendered useless, is preserved in spirits at this cabinet, (at Brussels) containing still the destructive agents, in the holes which they had made. I mention this circumstance, because I do not remember that we have any such curiosity at our British Museum."

Some idea may be formed of the infant commerce of New South Wales, from the cargo of Lady Barlow, from Sidney to London. The Colonial produces put on board that ship, consisted of fine sea elephant oil, 264 tons; fur seal skins, 13,730; the oak or beet, 3679 solid feet.—*Bell's Weekly Messenger.*

Among a number of acts, which have received the Royal assent, is an act to allow dealers to roast their own coffee, on certain conditions.—*Ibid.*

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

Agricultural Implements.

FOR sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchants' Row, a great variety of new and useful FARMING and GARDEN TOOLS, among which are the following, viz.

Nixon's Patent Cast Iron Plough; Tice's do.; Seever and Fay's do.; Wood's and Freebone's do.; Howard's Cast and Wrought Iron do.; do. Wrought do. do. Double Mould Board and Expanding do.; Sinclair Side Hill Plough; Beaton's Improved Scarifiers and Cultivators; Harrison's and James' Patent Corn Shellers; Jaquith's Threshing Machine; Willis' Patent Straw and Hay Cutter, the most improved and best constructed machine for the purpose ever invented. One the above Machines is now in use and may be seen: Niles' Livery Stable, Hawley Place.—Also, Safford Patent Straw Cutters; Hand Straw Cutters; Bennet Broad Cast Machine for Grass and other Seed; Co and Turnip Drills; Steven's Patent Steel Spring Hoe and Manure Forks; Brade & Co's Cast Steel Hoe Wright's Steel Plated do.; Common and Narrow do. Merrill's Steel Crook Neck do.; Iron and Steel Pot do. do.; Turnip and small Garden do. of all kind Garden and Pruning Shears; Transplanting Trow and Forks; English and American Shovels and Spade Bisbee's polished Cast Steel Back Strapped Shovel, new and very superior article; Cam's Cast Steel Scythe Brush and other Scythes; Common and Iron Tee Garden Rakes, together with many other valuable Tools.—Also, a New Improved Tree Brush for destroying Caterpillars.

☆ A liberal discount made to dealers in the above articles. April 3.

GARDEN AND FIELD SEEDS.

JOSEPH BRIDGE, No. 25, Court-street, has just received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seed which added to his former collection makes the greatest assortment in New England—among them are bushels early and late Peas, of various sorts; 150 lb Turnip, 100 lbs. RUTA BAGA, 200 lbs. Carrot, 1 lb. Beet, 100 lbs. MANGEL WURTZEL, 50 lb Cabbage of sorts, Cauldflowers, 100 lbs. Radish of sort Lettuce of sorts, Endive, Kail, Celery, SALSAF SCORZENERA, Onion, Leek, Sweet Marjora Thyme, Sage, summer and winter Savory, Lavender sweet Basil, Chervil, Fennel, Burnet, Grass See viz!—Herds, red and white Clover, Fowl Meadow, R Top—with a large collection of ORNAMENTAL SEEDS.

Garden Tools, viz:—Pruning and Budding Knives, Pruning Saws, Pruning Shears, Garden Reels and Lin transplanting Trowels, Rakes, Dutch or Pushing Hoe Edging Irons.

Gooseberry and Currant Bushes, Honeysuckles, Garden Roses, &c. 1200 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety, constantly for sale, such as Roses, Myrtles, Geranium Agapanthus, Orange Trees in fruit and blossom, Red Multiflora or Garland Rose, Mountain Daisies, Lauri tines, &c. 50,000 THORNS or QUICKS for hedges.

ENGLISH CHEESE, and fine ENGLISH SPIN PEAS. March 27.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of *Many Wurtzel Seed*, raised by John Prince, Esq., No. 24. April 24.

TERMS OF THE FARMER.

☆ Published every Saturday, at THREE DOLLAR per annum, payable at the end of the year—but the who pay within *seventy days* from the time of subscription will be entitled to a deduction of FIFTY CENTS.

☆ No paper will be discontinued (unless at the discretion of the publisher), until arrearages are paid.

No. 41.

Domestic Economy.

Frying is often a convenient mode of cooking—it may be performed by a fire which will be for roasting or broiling; and by the introduction of the pan between the meat and the fire, things get more equally dressed.

A frying pan should be about four inches deep, with a perfectly flat and thick bottom, perpendicular sides, and must be half filled with fat. Good frying is, in fact, boiling in fat.

To make sure that the pan is quite clean, wipe a little fat over it—and then make it warm and wipe it out with a clean cloth.

Butter, lard, or drippings, but what is quite new, fresh, and free from salt. Any thing spoils the look; any thing bad tasted or spoiled the flavor;—and salt prevents its frying.

Line olive oil is the most delicate for frying—but to have the best oil is very expensive, and bad oil spoils every thing that is dressed with it.

For general purposes, and especially for fish, fresh lard is not near so expensive as oil. It does almost as well, except for cutlets or chops. Butter often burns before you get the use of it, and what you fry will get a dark, dirty appearance.

Cooks in large kitchens, where there is a great deal of frying, commonly use mutton or beef suet, clarified;—if from the kidney or heart.

The mode of clarifying beef or mutton suet, as described in the Cook's Oracle, is as follows:—Cut the suet into thin slices, pick out all the veins and skins, &c. and put it into a thick and well-tinned sauce pan, and set it over a very slow stove, or in an oven, till it is melted; you must not hurry it,—if not done very slowly it will acquire a burnt taste you cannot easily get rid of; then strain it through a hair sieve into a brown pan. When quite cold, tie a paper over it and keep it for use.

Frying, if nicely clean and fresh, is almost as good as any thing,—if not clean, it may be clarified as follows:—Put your dripping into a sauce pan over a stove or slow fire; when it is just going to boil, skim it well, let it boil, then let it stand till a little cooled, then strain it through a sieve into a pan.

Whatever fat you use, after you have done frying, let it remain in the pan for a few minutes, and then pour it through a sieve into a basin—it will do three or four times, as it did at first, i. e. if it has not been used, but *Memo.* the fat you have tried fish in is not to be used for any other purpose.

To know when fat is of a proper heat, according to what you are to fry, is the great secret of frying.

To fry fish, parsley, potatoes, or any thing else, your fire must be very clear and your fat hot, which you may be pretty sure of, if it has done hissing, and is still. We cannot insist too strongly on this point; if the fat is very hot, you cannot fry fish either to a golden color, or firm and crisp.

To be quite certain, throw a little bread into the pan; if it fries crisp, the fat is ready; if it burns the bread it is too hot.

The fire under the pan must be clear and sharp, otherwise the fat is so long before it becomes ready, and demands such attendance to prevent the accident of its catching fire, that the patience of the cooks is exhausted, and they frequently, from ignorance, or impatience, throw in what they are going to fry, before the fat is half hot enough. Whatever is so fried will be pale and sodden, and offend the palate and stomach, not less than the eye.

Have a good light to fry by, that you may see when you have got the right color; a lamp fixed on a stem with a loaded foot, which has an arm that will lengthen out, and slide up and down like a reading candlestick, is a most useful appendage to hitch upon fire places, which are very seldom light enough for the nicer operations of cooking.

After all if you do not thoroughly drain the fat from what you have fried, especially those things that are full dressed, your cooking will do you no credit.

The dryness of fish depends much on its having been fried in fat of a due degree of heat, they are then crisp, and dry in a few minutes after they are taken out of the pan, when they are not, lay them on a soft cloth before the fire, turning them occasionally, till they are.—*Cook's Oracle.*

In a treatise on Domestic Cookery, appended to the last American edition of the *Domestic Encyclopedia*, we have the following directions.

If fish is to be fried or broiled, it must be wrapped in a nice soft cloth after it is well cleaned and washed. When perfectly dry, wet with an egg yolk for frying, and sprinkle the finest crumbs of bread over it, if done a second time with the egg and bread the fish will look much better; then having a thick bottomed frying pan on the fire, with a large quantity of lard or dripping boiling hot, plunge the fish into it, and let it fry middling quickly till the color is a fine brown yellow, and it is judged ready. If it is done enough before it has obtained a proper degree of color, the cook should carefully take it up, and either place it on a large sieve turned upwards, and to be kept for that purpose only, or on the under side of a dish to drain; and if wanted very nice, a sheet of cap paper must be put to receive the fish, which should look of a beautiful color, and all the crumbs appear distinct; the fish being free from all grease. The same dripping, with a little fresh, will serve a second time. Butter gives a bad color; oil fries of the finest color for those who will allow the expense.

Garnish with parsley. This may be done after the fish is fried.

ECONOMY OF DRESSING INFERIOR PIECES OF MEAT.

The coarse pieces of meat, when skillfully cooked, are nearly equal to the best. For instance, the tripe, when cleaned, may be stewed, boiled, broiled, soured, or dressed in pepper pot—the leg made into soup, and the gristly part into a jelly—the coarse part of the leg

made into a mode of beef, to which the cheek may contribute—the heart roasted with savory stuffing—the kidneys well washed, and broiled and eaten with fried onions. The liver also of a young beef creature, when broiled, is by many preferred to the best steak, and is thought to be very healthy and easy of digestion.

Connected with this is the re-dressing of cold meat, of which most delicious dishes can be made, by means of carrots, turnips, leeks, sweet herbs: full as savory as the original joint.

To this may be added the use of bones. By digesting the shanks of mutton and beef for a fortnight in dilute muriatic acid, (spirit of sea salt) I have procured jelly in the same shape as the bone, easily and perfectly soluble in hot water and fit for soup. Hence the theory of the use of ground bones in agriculture, as a manure for land. These suggestions will amount (if put in practice) to some pecuniary value, in the course of a year. The motto of a cook should be, no waste, no want.

To give flavor and gratify the palate you must keep up a regular stock and assortment of flavoring articles; and the mistress of the house ought to have a part of the garden, and a room in the house as a store room, under her sole dominion without intrusion.—*Domestic Encyclopedia.*

Vessels for boiling and stewing should have covers to fit close, and then a very gentle fire will keep them constantly boiling. Steam carries off the heat very rapidly, and should therefore be kept within the vessel. Steaming meat and vegetables is said to be a good mode of cooking, if the apparatus is not too expensive. Simmering makes meat tender, boiling makes it hard; of course a slow fire is the best, whenever a soup or what some call a stew is the object.

Correspondence.

GEOLOGICAL AND AGRICULTURAL SURVEYS.

To the Editor of the New England Farmer,

SIR,—While many of the good citizens of Massachusetts are deeply engaged in meditating schemes for improving the art of husbandry, adopting judicious plans for encouraging a spirit of emulation, by liberally granting premiums to industry and invention; it may not be unreasonable to conclude that those gentlemen whose office it is to conduct the affairs of the agricultural societies in this state, will readily take into consideration any subject which can materially benefit the cause in which they are enlisted. The subject, to which the attention of those gentlemen is now invited, is that of procuring geological and agricultural surveys.—Some part of the funds appropriated in premiums by the county societies might, perhaps, be more advantageously used in taking surveys of their respective counties. Those objects in the natural world, which are every day presenting themselves to our sight, demand a share in the study of every one. Our citizens, it is presumed, are so well aware of this fact, that they would provide themselves, at least, with the surveys of their own counties: this will not on-

ly afford them an opportunity of gratifying their taste, but the superior gratification of exercising their charitable dispositions in releasing their societies from the expenses of publication. That science, united with practical agriculture, is useful for rendering theory more perfect, is a point fully established, and nothing is better fitted to awaken the attention of the curious farmer, call his genius into action, and fit him for correct and useful observation, than an intimate knowledge of the soil he cultivates. **33.**

Hampshire County, April 27, 1821.

LEACHED ASHES AS A MANURE.

To the Editor of the New England Farmer,

SIR,—I wish to inquire of you and of your correspondents, your opinion relative to the usefulness of leached ashes as a manure. Residing near a pot-ash establishment, I can obtain this substance with little cost, but am prevented a plentiful use of it by the opinion current among my neighbors, that the final affect of it will be detrimental to my land. As my experiments do not extend beyond three years back, I am not able to judge correctly on this question. So far, however, as my experience has gone, the result of it has been uniformly favorable. It is said, by those who are opposed to leached ashes, that they ultimately leave the land cold and lifeless, and almost incapable of resuscitation. Your ideas on this subject and those of any of your correspondents who may have made sufficient experiment, will no doubt be welcome to many agriculturalists, as they certainly will to your subscriber. **B.**

Buckfield, Maine, April 20, 1824.

BY THE EDITOR. We have but little experimental knowledge of the properties of ashes, as a manure having never used that substance for that purpose, except as an application to the hills of Indian corn soon after the young plants had made their appearance. We will, however, communicate what we have been able to cull from books, and obtained from other sources of information.

Dr. Deane says that "ashes are not only a valuable manure, but an excellent antidote to the rapaciousness of worms and other insects. Therefore they are a more proper manure for all those plants which are liable to suffer by worms and insects; such as cabbages, turnips, peas, and other pulse. They should be spread evenly, and not in too great quantity.

"Wood ashes is an excellent nourishment for the roots of trees.

"Ashes of all kinds are a good ingredient in composts which are kept under cover. But when they are laid upon land unmixed they should be spread as evenly as possible. They are thought to do better on the top of the surface than when buried in the soil; for there is nothing in them that will evaporate. Their tendency is only downwards; and their salts will soon sink too low, if they be put under the surface. If they are spread upon ground, which has tender plants, it should be done just before a rain, which will dissolve and soften their acrimony: for tender plants, when the weather is dry, will be apt to be injured by them; at least, if they are in contact with the stems or leaves.

"Ashes in their full strength are certainly best for manure; and they will not be in full strength, unless they be kept dry; nor will it be easy to spread them properly. And they should not be laid on lands long before there are roots to be nourished by them, lest the rains rob them of their salts, by washing them into the

hollows, or by sinking them to too great a depth in the soil. A few bushels on an acre are a good dressing for grass lands that are low and inclining to be mossy. But ashes from which lye has been drawn have no small degree of virtue in them. The earthy particles are but little diminished; and some of the saline particles remain in them, especially in *soaper's waste* which has lime mixed with it."

The last American edition of Dr. Willich's Domestic Encyclopedia, under the head of "*Ashes*" observes that "Leached ashes are much used, in some parts of the United States as a manure. Great quantities are annually taken from the city of Philadelphia to Long Island for that purpose. They cost here 40 cents per one horse cart load, and commonly bring \$1, 50, when delivered. From a paper in the first volume of the *New York Agricultural Society's Transactions* by Mons. E. L'Hommidieu, it appears; that *ashes succeed best on dry loamy lands, or loam mixed with sand.* It is considered as the cheapest manure that can be procured. Ten loads of this manure, on poor land, will produce ordinarily twenty-five bushels of wheat, which exceeds by five dollars the expense of the manure, and the \$5 pays for the expense of labor in raising the crop of hay of between two and two and an half tons per acre which it will continue to do for a great number of years. No manure continues so long on the ground as ashes."

Sir John Sinclair says [Code of Agriculture, Appendix, page 27.] "wood ashes are certainly a valuable manure, and are peculiarly well calculated for *gravelly soils and loams*; forty bushels per acre is the common quantity, and spring the proper season for their application; if rain succeeds the effect may be relied on.

The reader will perceive that Dr. Deane's description of the kind of soil to which ashes may be properly applied as manure is entirely different from the soil for which ashes are recommended by the other writers above quoted. Dr. Deane advises their application to *low and moist land*; and we believe they have generally, been so applied in New-England. But they are successfully used on Long Island as an application to "dry loamy lands, or loam mixed with sand." Sir John Sinclair says they "are peculiarly well calculated for *gravelly soils and loams*." Perhaps it is owing to the mis-application of this manure that the opinion prevails in some parts of New England mentioned by our correspondent, that ashes "leave the land cold and lifeless and almost incapable of resuscitation." Ashes, when the wood has been pretty thoroughly burnt, compose something like the earthy or fossil manures, and form a part of the soil. They appear to possess an attraction for moisture, and if applied to a soil, naturally wet they increase its defects and diminish its fertility, by making it more wet than it was before the application. We might with nearly as much propriety apply clay to clayey soil, or stiff loam, as add ashes to a moist soil. Such are our views of this subject, but, perhaps, they are erroneous, and if so, we would thank any of our readers or correspondents, who would condescend to point out our error.

On the Manufacture of Straw and Grass Bonnets.

No. III.

The Large Silver Medal was this Session given to Mr. John Parry, Little Mitchell Street, Bartholomew Square, for the Manufacture of Leghorn Plat from Straw imported from Italy. Specimens of the Straw and of the Plat made therefrom, have been placed in the Society's Repository.

For the protection of our domestic manufacture of platted straw, and to encourage at the same time the importation of the raw material,

(the Italian straw being much fitter for the purpose than that grown in England,) the legislature has imposed the duty of 17 shillings a ton on the plat not made up, and a still smaller one of 5 per cent. *ad valorem* on the straw. In consequence of this, Mr. Bigg, a straw manufacturer, imported some time ago a considerable quantity of prepared straw from Leghorn, with a view of attempting its manufacture in this country, but not succeeding to his wish, placed the straw in the hands of Mr. Parry. Mr. Parry began by acquiring, himself, the art of plating according to the Leghorn method; he then taught it to other persons with success, that he has now above seventy poor women and children, constantly employed in the manufacture. For these spirited and successful exertions the society conferred on Mr. Parry the honorary medal above mentioned, in condition of his disclosing to the society the particulars of the mode of plating according to the Italian method. This they did in order that by giving the same a place in their Transactions they might communicate them generally to those interested in obtaining employment for the poor in the agricultural districts, contributing to the revival and improvement of a manufacture at once healthful and domestic and particularly valuable as accustoming children to habits of industry without the imposition of any hurtful degree of bodily labor.

The U. S. Gazette from which these Nos. are extracted gives, next succeeding the above, a communication from Mr. Parry, describing the manner in which Leghorn hats are platted, or braided and sewed stitched together. The communication, however, refers to figures in the *Transactions of the Society of Arts* a publication which we have not been able to procure. We have therefore substituted the following from *London Mechanics Journal*, which appears to be same in substance, although there is some variation in the mode of describing the process.—*Ed. N. E. Farmer.*

The process of plating straw in the Italian method is exhibited in the first figure. The straws are cut off the straw, and the straw sized to length and thickness, and also color. Thirteen straws are then taken and tied together at one end; they are then divided into a right angle, placing six straws on the left side, and seven on the right. The seventh, or outermost on the right, is to be turned down by the finger and thumb of the right hand, and brought up over two straws, over two, and under two, and thus seven straws will then be placed on the left side of the angle. Then the finger and thumb of the left hand is to turn down the seventh, or outermost straw on the left side, and bring it up under two straws, over two, and under two, and thus seven straws will be placed again on the right side of the angle; and so on, alternately, doubling and plating the outermost seventh straw from side to side, until it becomes too short to cross over so as to be placed on the other side of the angle; then another straw is to be taken, and put under the short straw at the point of the angle in the middle of the plat; and, by another straw coming under the joined one from both sides of the angle in the operation of plating, it will become fastened,—the short end being then left underneath the plat, and the newly fastened straw taking its place on that side of the angle, to which the short straw was directed; and when the plating is continued, until a piece of about twenty yards long is completed. The ends which are left out are then cut off with scissors.

The manner of knitting or sewing Leghorn together is done here principally by Italian processes.

The second figure represents two portions of the four times the real size, partly knitted together, shewing how the edges of one piece cover the edges of the other, and produce a continuation of the interrupted line that characterizes the plat itself, so that the junction is imperceptible on the other side; the uniting and being in every part covered by two straws; whereas, at the top and bottom, it is covered by a single loop.

The third figure represents two pieces that are knitted, but have been subsequently drawn asunder, in order to show more clearly the passage of the thread. It is first inserted under the straw 1, then under straw 2, 3, 4, &c. and comes out at the top.

The fourth figure shows the relative position of two loops with the thread passing within them; the loops being represented as pulled apart from one another.

The needle is pushed on through two or three folds at once, till nearly the whole of it is concealed in the folds; it is then drawn through in the manner of a bodkin, leaving its point to be taken by the thread. If the edges are not sufficiently close, the needle will miss one of the folds, and the joining is imperfect. Sometimes only every fold is threaded; but this requires coarser thread, small raised lines appear on the surface of the plat, which spoils its beauty, and diminishes its value.—*U. S. Gaz.*

Oil or Balsam of Gilead, how obtained.—This excellent family oil, which should be kept in every house, is made in the following simple manner. Put loosely into a bottle of any size,

as many balm of gilead flowers as will reach to about one third part of its height, then nearly fill up the bottle with good sweet oil, and after shaking it a little occasionally, and letting it infuse a day or two, it is fit for use. It must be very closely stopped, and will then not only keep for years, but be the better for keeping. When it is about half used, the bottle may again be filled up with oil, and well shaken; and, in two or three days, it will be as good as at first. The most alarming cuts and bruises of the skin which are so frequently rendered worse by spirituous balsams, salves, &c. are completely cured in a few days, and sometimes in a few hours, by this incomparable oil.

From the Massachusetts Yeoman.

WORCESTER CO. AGRICULTURAL SOCIETY.

At the recent Annual Meeting of this Society, Hon. LEVI LINCOLN was elected President, in the place of Hon. DANIEL WALDO, who declined a re-election. The following is a list of the other officers of the Society, for the ensuing year:—

AARON TUFTS, 1st Vice-President,
WILLIAM STEEDMAN, 2d Vice-President,
THEOPHILUS WHEELER, Treasurer,
OLIVER FISKE, Cor. Secretary,
WILLIAM D. WHEELER, Rec. Secretary.

TRUSTEES.

Atthol, James Humphreys—Barre, Nathaniel Houghton—Bolton, Sampson V. S. Wilder—Boylston, Aaron White—Charlton, Salem Towhee, jr.—Grafton, Jona. Wheeler—Harvard, Jacob Haskell—Holden, Samuel Damon—Lancaster, John Thurston—Leicester, Isaac Southgate—Leominster, Bezaleel Lawrence—Mendon, Benjamin Dayeaport—Milford, Pearly Hunt—Millbury, Asa Waters—North Brookfield, Charles Henshaw—New-Braintree, Samuel Mixer—Northborough, Joseph Davis—Oxford, Jonathan Davis—Petersham, Hutchins Hapgood—Princeton, Ward N. Boylston—Shrewsbury, Nymphas Pratt—Sturbridge, William Foster—Sterling, Stephen Hastings—Sutton, Jonas L. Sibley—Southboro', Jonas Ball—Uxbridge, Bezaleel Taft, jr.—Westborough, Lovett Peters—Worcester, Daniel Waldo, John W. Hubbard, Edward D. Bangs, John W. Lincoln, Silas Brooks, Samuel Ward, Thomas Chamberlain.

The following has been communicated for publication, as a Report made and accepted at a late meeting:—

The Committee to whom was referred the motion for admitting the Clergymen of the County *ex officio* members of the Society, without the usual payment of Initiation fees, Report, That the subject be indefinitely postponed.—Your Committee are impressed with a sense of the importance of obtaining the talents and exertions of that venerable order of men, in aid of the objects of the Society. We are not insensible to the superior advantages possessed by most country Clergymen for acquiring and communicating agricultural knowledge.—Early education, added to habits of reflection and observation, naturally lead their minds to these researches. Local situation generally affords them leisure from the severer duties of the closet and the desk, for the pursuit of agricultural experiments, and philosophical inquiries.—When "much study is a weariness to the flesh," such relaxation becomes as necessary for the

refreshing the body as relieving the mind. Some of the best specimens of rural economy are to be found upon our glebe lands and ministerial farms. The rugged elms, and solid moss-grown walls, in some of our parishes, attract the attention of the traveller to the spot, where in other days, "the village preacher's modest mansion rose," and in more modern times, the *manse* is generally found upon a farm less extensive than formerly, but as neatly cultivated. In the discharge of his daily parochial duties, the Minister necessarily acquires a knowledge of the management of each man's farm, perhaps more thorough and minute, than any other member of the parish. Added to all these considerations, his faculties for communicating the fruits of his researches, and the results of his experiments, give to the agricultural community a claim upon the labors of these useful men.

And with reverence we would inquire, would a proper portion of time, devoted to these labors, unfit Clergymen for the higher and more important duties of their stations? Is the cultivation of the earth an employment incompatible with the sacred functions of a Minister of the Gospel? To dress the garden, and to keep it, was one of the first injunctions of his Creator to the great progenitor of the human race. And in every subsequent age, the descendants of apostate Adam "have eaten their bread in the sweat of their brow." To witness the daily operations of a benevolent Providence, to trace a present Deity in all his works, must enkindle the fire of devotion, and lift the soul in grateful adoration to the Giver of all good.

We should therefore rejoice that our rolls should embrace all the Ministers of the County, of every denomination: whether he cultivates a farm or not, his name and his influence will advance the great objects in which we are engaged. We believe, from inquiry, that most of our Clergy would prefer a standing in the Society equal to that of other members.—A proposition to admit them *gratis*, has been made in similar Societies, and Ministers have not been disposed, generally, to avail themselves of the privilege. Men, in all professions, consider that which costs nothing, as of little value, and not entitled to great attention; besides, a difficulty occurs in regard to those worthy men of that profession, that have already been admitted to the Society. To return the money, would be weakening our funds, and to retain it, would be making an invidious distinction among gentlemen who are entitled to an equal standing in any community.

A considerable proportion of our clerical brethren were made life members of this society by the voluntary donation of some benevolent member or members of their respective parishes. Under the present precarious tenure of ministerial support, this is manifesting an spirit of the purest patriotism and liberality. "Go and do likewise," is recommended to the friends of agriculture and manufactures, in all our towns. It would give evidence, at once, of their personal respect for their Minister, their confidence in his abilities, and at the same time, would be permanently advancing the great interests of the County. Among the multiplied calls for public charities, that which yields their daily bread with more facility, both to the rich and the poor, most certainly should have a place.

[*ibid.*]

DISEASE IN PEAR TREES.

We have heard complaints that the Pear Trees of some of our best cultivators in the vicinity of Boston are in a perishing condition, from some cause or causes not ascertained, and perhaps not ascertainable. The trees have been thoroughly examined, and sawed into small pieces, with the hope of detecting the destroyer in some insect, which might escape common observation. We think it not improbable that the following article may furnish a clue to the mystery. Perhaps some people kill their pear trees, in the same way that some spoil their children, by too much kindness. At any rate we should think it advisable to try what would be the effect of letting them alone, and see if less trimming and manuring may not be attended with beneficial consequences. We do not know but trees as well as animals may die of surfeits, or, as a medical man would say, might be subject to plethora. If there is more nourishment received by the roots than the branches can dispose of, the trees (in a free government) will take the liberty to die, let science say what it will on the subject. To be sure they may not die *secundum artem*, but still if they are *doctored* off they will as surely come to an end as if they had been starved for want of manure. We apprehend that pear trees as well as peach trees partake a little of the nature of Hebrew roots, which Butler says

—“Are always found
To flourish best on barren ground.”

But, we do not pretend to be positive about this matter; we only suggest the thing for consideration; and if our views are erroneous, shall be happy to stand corrected.—*Editor N. E. Farmer.*

From the American Farmer.

Elmhurst, Jan. 1st, 1821.

The great disappointment that has attended the cultivation of the finer kinds of the pear has been matter of much regret, with all the lovers of this delicious fruit. And some who were most forward to obtain them and most particular in nursing them, have utterly despaired from a consciousness of their great attention to them, and knowledge of general failure. But let us remember, that a similar despair prevailed respecting grapes, which is now done away by actual cultivation.

The object of this paper is not only to inquire theoretically into the cause of the most common disease that assails them; but to produce actual facts, which must convince the mind, the most sceptical, of the practicability of retaining these fine fruits, and that by means level to the capacity of every one.

The principal disease that affects them, and the one I particularly allude to, consists in a withering of the interior bark, especially of the limbs, appearing in spring in spots and bars, and more extended affections of the same kind, spreading to the destruction of the individual limb, though the superior part of the limbs are often unaffected by the disease, and are only destroyed by being cut off from the juices of the main stock. As I know of no animal disease exactly resembling it in cause and effect more than Kibes, which consists in cold overtaking a high circulation, and throwing off the skin to perish, I shall call it by that name, to distinguish it from the very improper appellation, blast, which is applied to trees killed simply by severity of cold or heat.

In all the various suggestions as to the cause of this disease, I never heard of one that came

near to the fact, which is more to be wondered at as the real cause has been so strongly indexed by notorious facts. Such for instance, as hard winters, with long cold springs, giving us good pears and leaving us sound trees, whilst a warm winter and especially a warm February, followed by a cold March, (a thing almost inevitable,) destroys our trees. We have long been acquainted with this much of vegetable physiology that the bark (as the juices fall and the fall comes) forms on its interior surface longitudinal fibres the same as sap wood, and by this means adheres to the main sapwood, becoming one and inseparable—and that when a certain temperature, say that of April, becomes steady, that those very same fibres having lost their color and become maternal, throw out juices and form fibres differently disposed and colored, or bark. Just as we see on denuding a chestnut-tree when the sap is running, a new bark is formed by light and heat acting on those juices, and giving them a form and color different from what would have ensued if excluded from light and heat.*

It would, therefore, seem to be the order of nature, that a tree could not otherwise exist in severe cold weather, but by this union of bark to the sapwood. This partial retrocession of juices and unity of the parts—a separation at such time, would be as certain to produce injury and death of the bark, as evolving its fruit buds would annihilate the fruit of the next season.

It appears, that light and heat with the consequent flow of juices by continuing to act on the organic matter of the tree, would form in the first or lowest degree of circulation, the above named longitudinal fibres of sapwood—in the next degree bark, in a higher degree leaves and buds of different kinds, by a still high temperature the wood buds would be elongated into branches, and by the greatest degree fruit buds into blossoms, germ fruit—every one of these operations seem more and more external or exposed, as if the tree with consciousness of her safety and the sun's approach, had successively unfolded her inmost recesses of beauty and usefulness; falling back in the same order with the retiring season—that which was last, falling first—till all has retreated into winter quarters.

It is a well known fact, that the finer kinds of pears are introduced from a milder climate than 39 degrees (from France,) and therefore, are very sensible to both cold and heat. They are trees that abound with juices, as may be seen by the numerous scions that they fling up around them. If the latter part of winter, or early, spring is warm, these juices are set about, especially if the ground is rich and cultivated. In this degree of light and heat the bark begins to form, a separation to take place from the new made sapwood, and in a few days, winter returns upon the tree, or in other words, February has been spring and March winter—an imperfect bark is thus separated from the mother white wood, and like the untimely, weaned child, it sickens, it droops, and as heat is farther applied, the damage increases till it dies,

*It appears that the sapwood in the plantule makes the first bark, as may be seen on the young Melia, and then does the office occasionally to supply the deficiency by accretions, whilst the bark ever after annually makes sapwood, and increases the size of the tree with a visible addition.

because this heat evaporates the juices faster than it can force them into the contracted vessels—which perhaps never can be made to expand again in the vegetable, whatever may be done in the animal economy.*

It is highly probable, that north of this (Virginia) many trees die of winter cold, the excessive retrocession of the juices may become fatal, the bark may give way and split. This is often the case with exotic shrubbery, and is remarkable, that they always give way at the trunk, where the bark is less elastic and scurfy. It will, therefore, be easy to distinguish this disease, which is more properly a blast from Kibes—and moreover, it requires a very different treatment. Manuring articles made into a paste and spread on the body and large limbs with a sedge broom, will be a great defence where matting is not to be had—such instance as white wash, thickened with ash and soft cow dung. But in the disease I have been describing, it might be the very cause of death.

Let us now proceed to matter of fact; I know of only two sets of healthy pear trees, they have in five or seven years changed owners. In the time of the former owners, much attention was paid to them and the disease was constant. The present owners neither manure nor dig about them. In one of these, I know that the ground has surrounded them unbroken for years, as they are not only perfect but bear fruit, while all others fail—they are Bergamot. In the other set alluded to more attention is paid, the grass is cleared away in early summer, the shoots are permitted to grow for forty feet around them in such quantity, as to defy removal but with a scythe, and these remain the next grass time—no manure is applied and the ground naturally poor. Even the unhealthy trees have shot out new and healthy branches since they have remained undisturbed: the facts are too plain to be misunderstood, they point out the remedy as well as the manner of the remedy acting. The abundant juices restrained in the first case, which is preferable and in the latter they are partly restrained and partly diverted into young scions.

I will mention two other facts, though not plain, yet they confirm the above. I moved a place where there were two very healthy pear trees, (Vergolieu,) one was choked as I thought with grass, the other was so surrounded with scions as scarcely to admit approach. I removed the scions, dug and manured the ground both, and the consequence soon ensued; I lost them by Kibes. The other case that confirms those opinions and facts, was that of a garden of my acquaintance, who was actually on the right track to save his trees, but for want of understanding the true cause of the disease he failed—he discovered that the trees which his honey suckles around them, were less liable to disease; but he supposed it were protection and therefore manured and dug, and thus dug the grave of his fine trees.

Let us therefore suffer our trees, after they have come near the fruit bearing period to vegetate naturally—they will be a little more tardy in growing up, but they will be hardy.

*It is sometimes the middle of summer before the whole damage is developed, and some imperfect forming, has led those who merely take a peep at the tree, to conclude it to be done at this time.

healthy and bear well. If our grounds are already rich and loose about the trees, part of it may be removed in the first warm spell, as winter goes off; and we may plant some shrubby at springs early about their roots, such as roseberry bushes or current bushes, or honey suckles or running box; or lay on in place of the rich ground, some sods from poor ground—perhaps some boards or long manure laid on the spots in the severity of winter and moved off the first warm season, might back the juices—various experiments might be made to restrain and divert the too free and early circulation.—the rearing of two trees nearly in contact, giving them the espalier form) might answer. It is clear then, that pear trees, and peach trees could not approach each other, for the former will require treatment exactly reverse of the latter, and I believe in all the knife should never be used after a tree bears fruit, unless some accident makes it necessary, as in the animal.

SILVANUS.

From the London Journal of Arts and Sciences, for March, 1824.

Perkins' Steam Engine.—It was our intention to have remained silent upon the subject of Perkins' improved engine, until the ultimate experiments had been exhibited; but the repeated inquiries which are daily made relative to this interesting invention, induce us to communicate such information as we are enabled in time to time to collect. The public have doubtless considered that the silence which has for some time prevailed upon this interesting subject, must be construed into a tacit acknowledgment that the project has failed. It is acknowledged that such an inference is warranted; but when a reasonable cause is stated, perhaps the nearly exhausted patience of the scientific world may, for a short time longer, be kept from sinking. The fact is, that after all the endeavors which had been made to construct a generator, none had been produced which would hold the steam under its great pressure, without very considerable leakage at the joints between rivets. This necessarily reduced the power of which a perfect vessel would have been capable of exerting, and under these circumstances Mr. Perkins declined producing an imperfect experiment, which would have gone to the public as his ultimatum.

His difficulty is now removed, a generator having been at length produced, of wrought iron without any seam or rivets, which, has, we understand, been proved to sustain the enormous and incredible pressure of twenty thousand pounds upon every inch of its surface. This very extraordinary and unique piece of workmanship has been made by Mr. James Russell, of Wrentham, and is considered by Mr. Perkins to have surmounted all his practical difficulties. The objections which have been urged against this new engine, as to the little power it has been supposed to exert, have met by Mr. Perkins with some very extraordinary experiments, exhibiting its projectile force compared to gunpowder. A small apparatus has been constructed, which we may call a steam gun; this, when connected with the generator, was found to propel bullets of the ordinary musket size, at the rate of 240 per minute, and with such force, as after passing through an inch deal, the ball, striking against an iron target, became flat

tened on one side, and spread out; the original diameter of the bullets was, 650 of an inch;—when picked up, after striking the iron target, they were plane convex 1,070 wide, and 0,290 thick.

It is presumed that these experiments (whatever may be the ulterior advantages of steam-guns) are sufficient to prove that the steam produced by Mr. Perkins' new mode has sufficient power to impel any machinery to which it may be adapted. We hope in our next, or at least, at a very early period, to be enabled to speak satisfactorily of the steam-engine.

ON THE CULTURE OF ROSE BUSHES.

Translated from the French, for the Old Col. Memorial.

Roses are increased by seed, buds, layers or shoots, and by graft on other rose bushes.

The rose from the seed comes slowly; it diversifies varieties.

The most usual method to multiply roses is by buds and layers.

Grafting succeeds better than budding with the choicest roses.

Plant not rose bushes either during frosts or great heat.

Dry earth causes more fragrance, and higher and stronger colors.

Moist earth larger roses, less colour, and slower and later growth.

The rose will not flourish in pots or boxes, on account of its numerous roots.

The blooming of yellow roses may be anticipated, by pulling off the buds and leaving but a few.

The hundred leaved rose will not flourish in the shade.

The white double rose stifles the growth of those near it; particularly the yellow rose.

Pruning agrees generally with every species of rose, except the yellow and the musk-rose.

If rose bushes are watered with a ley made from the ashes of burnt rose bushes the salts contained in it will wonderfully contribute to their growth.

From the American Journal of Arts and Sciences, For June 1823.

Geological Survey of North Carolina.—We understand that Professor Olmstead of the University of North Carolina, will soon commence a series of geological and mineralogical observations, intended, eventually, to comprehend a scientific survey of the State. From the known intelligence, zeal, and scientific attainments of Professor Olmstead, we cannot doubt, that if adequately encouraged, the enterprise will produce very important advantages to science, agriculture, and the other useful arts; and will prove highly honorable to the very respectable State of North Carolina. In no way, in our apprehension, could the same sum of money be more usefully expended; and it would be no small honor to have set the first example of the scientific survey of an entire American State. We hope then to see the next edition of the map of North Carolina,* present at least, the leading features of geology and mineralogy. It would be very desirable also, that the Botany and if practicable, the Zoology of the country should be investigated at the same time.

* Price and Strother's map of North Carolina, from actual survey, has great merit.

RECIPES.

To make Mead.—Take the white of twelve eggs, mix them well in twenty-four gallons of water, to this put forty pounds of honey. Boil the whole one hour; then put in a little ginger, and a little cloves, or cinnamon, or mace, or pimento, or a very small quantity of each, as may be convenient. When the Mead is cold, add a spoonful of yeast, and pour it into a cask, which should be full that it may work out at the bung. When the fermentation is over, close the cask, and put it into a cellar or vault, where no changes in the atmosphere will affect it. When it has stood six or eight months it will be fit for use, and may be bottled off.—Some prefer to omit the spices, which may be done, and good Mead still be made.

Composition to be used instead of Yeast.—To make eight quarts of this composition, boil in common water eight pounds of potatoes, as for eating; bruise them perfectly smooth, and mix with them, whilst warm, two ounces of honey, or any other sweet, and one quart (being the eighth part of a gallon of yeast) of common yeast. And, for making bread, mix three beer pints of the above composition with a bushel of flour, using warm water in making the bread; the water to be warmer in winter than in summer; and the composition to be used in a few hours after it is made; and as soon as the sponge (the mixture of the composition with the flour) begins to fall the first time, the bread should be made and put in the oven.

Method of curing bad Tub Butter.—A quantity of tub butter was brought to market in the West Indies, which, on opening, was found to be very bad, and almost stinking. A native of Pennsylvania undertook to cure it, which he did, in the following manner:—

He started the tubs of butter in a large quantity of hot water, which soon melted the butter: he then skimmed it off as clean as possible, and worked it over again in a churn, and with the addition of salt and fine sugar, the butter was sweet and good.

To keep Oranges and Lemons.—Take small sand and make it very dry; after it is cold put a quantity of it into a clean vessel; then take your oranges, and set a laying of them in the same, the stalk end downwards, so that they do not touch each other, and strew in some of the sand, as much as will cover them two inches deep; then set your vessel in a cold place, and you will find your fruit in high preservation at the end of several months.—*Late English Publication.*

Improved Corks for preserving Wine or Chemical Liquors.—Melt together two parts of white wax and one part of beef suet; dip your corks in this mixture, and immediately dry them in a stove upon an iron plate; repeat this operation twice, and the corks thus prepared will preserve any liquor well without imparting any ill flavour thereto.

James Murray, fishing in the Clyde, caught a very large codfish, weighing 17 lbs. 4 oz. in the gut of which he found a gold watch, bearing the inscription, on a paper in the case of it, "Hugh Davies, of Wrexham;" there was a chain and seal attached to the watch.

NEW ENGLAND FARMER.

SATURDAY, MAY 8, 1824.

FARMER'S CALENDAR.

INDIAN CORN. It will soon be the right time to plant your Indian Corn; and having heretofore (vol. i. pages 334, 341.) given more directions than we fear many of our readers will take the trouble to comply with, we shall be pretty brief on the present occasion.

No rules of universal application can be given respecting the time of the year when corn should be planted. This depends on the nature of the ground and the state of the season. The farmers of Rensselaer county, New York, prefer the middle of May for planting. But if the land is very dry and warm they plant the first week in May to prevent suffering by drought. They say that ashes or quick lime ought always to be applied to the top of corn-hills, immediately after planting, if it follow sward, to prevent grub-larva from destroying it. The same application will have a similar effect, if applied to potatoes, but neither unleached ashes, or lime, in a quick or caustic state, should, in any case, come in contact either with the seed corn or the young plants.*

As a farther precaution against insects and to bring forward germination, it is recommended to wet the seed corn in strong tar-water, or water in which turpentine has been infused, and then roll it in plaster. But care should be taken not to coat the dry corn with tar, as that process may prevent its sprouting. A great many other liquids, steepings and infusions have been recommended as preservatives against worms, &c. but we believe tar water is as effectual as any. There is danger in soaking the seed too much, especially if it be planted early in the season, as it sometimes causes the corn to rot in the ground. But if planting a second time should become necessary, by means of the destruction of the first seed, or if planting be delayed on any account till the beginning of June, then it will be proper that the seed should have warm water poured on it. Let it not soak more than a quarter of an hour, and be cooled speedily, and be planted before it dries. The corn will be forwarded in its growth by several days.—The seed should be covered with about two inches of earth.†

The following article from the *American Farmer*, vol. v. page 264. shews what wonders in the culture of this crop, may be effected by skill and industry:—

GREAT YIELD OF CORN—AND NOVEL MODE OF PLANTING IT.

A friend on a visit to New York, who is habitually attentive to the state of domestic industry, and the progress of public improvements—writes as follows:—

DEAR SIR,—John and Matthew Pratt, of Eaton, Madison county, New York, have raised this year, 680 bushels of Indian corn, from 4 acres of land—last year they raised 517½ bushels from 3 acres; will bet \$200, that within 3 years, they will raise 200 bushels from one acre—they prepare their land well, then make by a shovel plough, a trench 20 inches wide, put in

their manure and cover—2 feet 9 inches off, they make a similar trench, place their manure and so on through the field—they then cover their trench drill in their corn thus:

..... six inches apart each way.

.....
..... 2 ft. 9 in.
.....

..... space between the three rows.

When corn is at a proper state, they with a light plough, throw a small furrow up on each hill and hoe it in; as this exceeds all our southern ideas of corn produce, I think you will do well to write them on the subject.

New York, 30th October, 1823.

If your corn is planted on sward which has been turned over, without cross ploughing, and the sod is not thoroughly rotted, it will be best to make the poles for the hills quite through the turf, otherwise the young plants will receive little or no benefit from the fixed air underneath, and the roots will not penetrate through the furrow-slice till it is too late for the plants to obtain a good growth. When you plant in hills be careful not to drop the kernels too near each other, but see that they are four or five inches apart. Some advise to plant a row or two of potatoes or mangel wurtzel between each row of corn. When dung is placed in the holes an inch or two of earth should be spread over the manure before any of the seeds are dropped. There is nothing in any of the processes of husbandry, which requires more attention than the planting of Indian corn and other seeds. We have known a single laborer plant five acres in a day. But he had better be asleep, for he, generally, dropped six or eight kernels in a clump or space of about the compass of an egg shell. The plants would, of course, be so twined and twisted together that one could not be taken from the hill without destroying the economy of the whole. The plants, of course, were suffered to grow in the form of a brush; one robbed the other of its nourishment, and small stalks and pig-corn composed almost the only products.

WHITE-WASHING FRUIT TREES. We published in a former number (page 254 of the 2d volume of the *New-England Farmer*) some remarks of "D. W. Jun." a correspondent of the *American Farmer* in which that writer observes in substance, that the too common practice of white-washing fruit-trees will not only destroy insects which infest the trees, but the trees also, by its caustic qualities; and that the trees should not be subjected to any application, which would encrust them with a thick paste for "cleanliness is as important to them as it is to the human family." We have likewise seen similar ideas respecting the application of a white-wash composed of lime to the bark of fruit-trees enforced in English publications. We have however learnt by inquiries of some respectable and successful cultivators in the vicinity of Boston that they have applied white-wash, composed altogether of lime diluted with water to the consistence of thick paint for several years in succession, to the bark of their fruit-trees, not only without any visible injury, but with great apparent benefit. We, therefore, as at present advised, must conclude that the apprehensions of "D. W. Jun." are not altogether well founded, at least as

respects the trees growing in our climate, and the lime commonly used in this part of the country. It is not improbable, however, that a white-wash made of magnesian lime stone, which is peculiarly caustic, might prove injurious. And we are assured that even mild lime, such as the pulverized plaster of old buildings, applied to the roots of apple-trees in considerable quantities, has been found to injure them.

This view of the subject corroborates the statements and reasonings of O. Fiske Esq. whose remarks relative to the point in dispute were republished in page 306, vol. ii. of the *New-England Farmer*; and we certainly know of no better authority than the testimony of that gentleman affords, whose reputation as a correct and scientific cultivator is so well established, and so extensively known, that any recommendation of ours would be mere matter of supererogation.

The following is a statement of the produce of some what less than one quarter of an acre of land raised the last season. The land is situated in Brookline, Mass and is owned by a respectable mechanic of that place

PRINT OF GENERAL WASHINGTON. Proposals b John Chorley (Engraver) and Clark Rice, for publishing by subscription, an elegant full length Engraving of the illustrious GEN. GEORGE WASHINGTON; to be copied from a print, done by Mr. James Heath, from an original Picture executed for the Marquis of Lansdowne, by the celebrated Painter, Gilbert Stewart, (Boston, Mass.

This is the first attempt ever been made to lay before the American public the means of possessing large, elegant, and correct likeness of Gen. WASHINGTON. In England, splendid Engravings are common of this distinguished individual, whilst in his native land scarce any are to be found.—Now and the a solitary one appears, meteor-like, of the London plate, bought, even at auction, at 5, 8, and 10 dollar.

The subscription is to be immediately close when a sufficient number of patrons shall have been obtained for the prime run of the plate. Every subscriber's print shall be what good judges would pronounce sound—not in the least defective.

CONDITIONS.

I. The print to be engraved in a masterly style, equal to the London copy.

II. The paper to be of the best quality.

III. The printing to be executed in every respect equal to that done in London.

IV. The price is to be four dollars to subscribers, a delivery, which shall be within eighteen months after a sufficient number shall have been obtained to indemnify the publishers.

NOTE.—It may not be improper to repeat, that it is intended to offer none of the prime impressions to an except subscribers.

The hand bill from which the above is copied contains a well written article, intended as an inducement to Americans to patronise the proposed publication; but which we think it unnecessary to copy. The name of WASHINGTON alone convey all that is splendid in panegyric, and the most lofty eulogy of his character appears like an effort to illuminate sun-beams with the rays of a taper. Ever friend to his country must feel a wish to possess the image of him who was "First in War—First in Peace—and First in the Hearts of his Countrymen." We think this or some other Portrait of our illustrious Chief—the Captain of our Political Salvation, and the Principal Author of American Independence, ought to adorn every Sitting Room from the Cottage of the Laborer to the Mansion House of the Man of Wealth.—

* Memoirs of the New York Board of Agriculture, vol. ii. p. 25.

† Domestic Encyclopedia.

uch an ornament will serve as a silent lesson addressed to the best feelings of patriotism and humanity. It will tell us *as you are, so will you be distinguished, serve well of your country, and your countrymen will hold you in everlasting remembrance.*

It only remains for us to say that from our personal knowledge of Mr. Chorley, the artist, we have no doubt but he will perform all that he has promised—and those who subscribe to his proposals, will in due time, be presented with an accurate, and finely executed portrait of the **GREAT ORIGINAL.**

Since the above was in type we have been informed at the publishers, in addition to their other engagements have agreed to present each subscriber together with his print "*A Summary of the Principal Events of the Life of Washington.*" To be done on a sheet of superfine medium royal sized paper, that it may be finished, and mounted in the manner of a Map. This edition is not to increase the specified price of four dollars.

FOREIGN.

The last news from the seat of war between Greece and Turkey is favorable to the former. There are accounts of the capture of Carysto by Ulysses. The Greeks were to direct their efforts against the fortress of Negropont, and Ulysses hoped to get possession of that fortress before the month of May.

A treaty had been ratified between the Turks and Russians.

Three vessels of war have arrived at Missolonghi, in England, with munitions of war for the Greeks.

The British are taking measures for ameliorating the condition of the Slaves in the West Indies. An official Protector and Guardian of Slaves is to be appointed to Trinidad, who is to be entrusted with the maintenance of their rights. Slaves are not to be employed on any labor on Sunday, and provision is to be made for their religious instruction. Provision is to be made by which they may acquire and hold property—saving slaves are to be established for preserving their earnings, and a provision made by which they may purchase their freedom.

Mr. Canning has proposed in the House of Commons a bill for making the slave trade at sea, by British subjects, *Piracy.* He expresses his satisfaction that Great Britain and the United States, "the two first maritime powers in the world co-operate to destroy this infamous traffic."

Mr. Canning has placed as an inscription over the mantle-piece of his study, the following well known motto from Virgil—

"*Poenitus toto divorsio orbe Britannos.*"

Of which the following extract from one of his speeches given as an apt translation, "the English must not content themselves with moving within their own island."

London article dated March 16, states that the King of Algiers has renewed his engagements with the British Admiral, Sir Harry Neale, not to make Christians captives, and to abide by the treaty made with the Exmouth.

DOMESTIC.

It should seem, by the last accounts from Washington that there is but little likelihood that the New Tariff Bill will become a law during the present session.

The No. of the National Intelligencer observes that the blow inflicted on the Tariff Bill in the Senate has been followed up by a third, by which the prospective duty of 5-1-2 on Cotton Bagging is stricken out.

We understand, however, that the bill is not entirely destroyed. It is supposed as a possible event, that in the duties on iron and hemp, which have been successively stricken out, a lower rate of duty on each of these articles may find favor with the Senate.

As, however, that we see little prospect, at present, of the bill becoming a law, at this session, in any event.

Greek Cause.—The sum of \$639.29 has been received in New York, in aid of the Greek Cause, and forwarded to England. Other donations of money,

says the New York Mercantile Advertiser, have been advised of. The donations collected of swords, pistols, and munitions are to be forwarded to Leghorn.

Slave Trade.—A treaty concluded between the Commissioners of the United States and Great Britain, giving a mutual right of search to the commissioned vessels of each nation in the case of vessels being engaged in the slave trade has been received at Washington, and will soon be laid before the Senate.

Female Seminary.—Mr. Benjamin Farusworth proposes to establish a Seminary in Worcester, Mass. for the instruction of Young Ladies only, and has engaged the assistance of Miss C. Sprague, a lady of distinguished literary attainments.

ROXBURY, APRIL 30, 1824.

The present season is not only one of the earliest, but it is also one of the most forward we have known. The winter was mild beyond all recollection—and this character extended to Europe. We have letters from England stating that they have had no winter. Flowers were in bloom, thro' every month in the year.

I shall reserve for a few days a comparative account of the season, but at present, I would state, that asparagus was cut from eight to fifteen days earlier than usual, on the same beds; the maple flowered eight days earlier than its common period; the gooseberry six days earlier; and all other plants in proportion. The grass is uncommonly forward, and very well set. The winter grain did not suffer in this vicinity, and is at least six inches high and very vigorous. Generally speaking, every plant and tree gives promise of unusual vigor. But late frosts and cold storms often blast these early hopes, and we shall reserve till the last of next month, a full comparison of this season with the past.—*Boston Daily Adr.*

Caution to Stage Drivers.—A verdict of \$500 has been recently obtained for injuries received by the upsetting of a Stage. The action was brought against Joseph Hunt, and others, proprietors of a line of stages between New York and Albany. Rev. Ira Ingraham, the prosecutor, was seriously injured, having his collar bone fractured, and otherwise severely bruised. It was clearly proved the accident was owing to the carelessness of the driver.

CONGRESSIONAL.

SENATE.—Friday, April 23. The bill from the other House, to provide for the necessary surveys for roads and canals, by appropriating \$30,000 was discussed, and it was decided that it should have a third reading. Yeas 25, Nays 21.

Saturday, April 24. Several local and private bills were acted upon.

The Tariff Bill was discussed, and ordered to be printed. The bill to provide for the settlement of certain pecuniary claims against the United States was read a third time and rejected. Yeas 19, Ayes 25.

The bill to provide for the necessary surveys, &c. on the subject of roads and canals, was read a third time and passed. Yeas 24, Nays 19.

Monday, April 26. A bill further to amend the Judicial system was considered.

Tuesday, April 27. A bill making appropriations for the fortifications for the year 1824, was passed after debate. Numerous bills from the other House were read and committed.

Wednesday, April 28. The Tariff Bill being under discussion. Mr. Mills moved to amend it by striking out the following clause:—On iron, in bars or bolts, not manufactured, in whole or in part, by rolling, ninety cents per hundred and twelve pounds weight. This motion, after debate, was decided in the affirmative.—Yeas 24, Nays 23.

Thursday, April 29. The Tariff Bill was again discussed. Mr. Lloyd, of Mass. moved to strike out the clause "*on hemp two cents per pound.*" This, after a protracted debate, was agreed to. Ayes 24, Nays 22.

House.—Friday, April 23. A resolution to instruct the Committee on Public Buildings to inquire into the expediency of purchasing three of Capellano's marble busts of Washington was agreed to, 69 to 64.

A bill allowing bounties to persons employed in the Cod Fisheries in certain cases, was ordered to have a third reading.

A message was received from the President, stating, in substance, that he had ordered Minnan Edwards, lately appointed Minister Plenipotentiary to Mexico, not to proceed on his mission, "but to await such call as might be made on him, either by the House, or its Committee."

Saturday, April 21. The Joint Committee on the subject of a recess, reported in part on the classification of the business to be acted on the present session, without touching the question of adjournment;—also, that after this day, there be two sessions daily—the recess to be from two to four o'clock; and that the hour to which the House shall stand adjourned be 10 o'clock in the forenoon. This report, after debate, was accepted.

Monday, April 26. The Joint Committee of conference on the Appropriation Bill recommended a compromise of the differences between the two houses thereon.

Wednesday, April 23. A Message was received from the President on the accounts and claims of Daniel D. Tompkins, in which it is announced that the President had allowed him, in addition to the sum paid him under the act of the present session, and the moneys charged to his account, a balance of \$60,336 46 cents.

Thursday, April 29. This day was devoted mostly to private bills.

From the Boston Centinel.

22d FEBRUARY 1732.

PARIS, Feb. 23. WASHINGTON'S Birth day was celebrated on Saturday last, by the Americans in Paris. Mr. Consul BARNET presided, and among the guests was Gen. LAFAYETTE. On the health of the General being given he rose and made the following acknowledgment:—

"I request you, gentlemen, to accept my affectionate thanks for these new testimonies of your friendship. While every generous mind, on this side of the Atlantic, has applauded the *late noble and timely declaration of the United States*, it could not but excite the pride of a heart glowing with all the feelings of an old American patriot and soldier—engaged, as I have been here from the beginning, and as I now am, in the great contest between the rights of mankind and the pretensions of European despotism and aristocracy.—These are motives of duty and honor that must direct the time when it shall be my happy lot to revisit the shore of freedom, but that moment will be the most delightful I can ever enjoy."

This was of course received with great applause.—When the cheers were over, a member of the committee of arrangements rose and read the following lines, which were understood to have been hastily furnished by a person present:—

The last General of the American Revolution.

Let Greece tell her story of patriots bright,
Like stars in the firmament set,
Yet they fade in the beams of a purer light
When placed by the side of FAYETTE—

Let Rome too unfold her old classical page,
Where the names of her mighty are met,
Yet where is the glory of hero or sage
That eclipses the name of FAYETTE—

If Europe a laurel of honor combines
On her worthiest brow to be set—
Disclaiming her monarchs, her wreath she entwines,
Immortal, around her FAYETTE—

For he is a star that shines bright and alone,
Where others are faded or set,
And far be the day when his splendor is gone
And the world mourns the loss of FAYETTE.

The volunteer toast of Geo. FAYETTE.

American Policy—and may the plain dealing and firmness of a self-governed people secure the younger natives of the American continent against the two-fold danger of hostile aggression and *unequal friendships*.

DEAN SWIFT'S RECEIPT TO ROAST MUTTON.

To Geminian's beautiful air—"Gently touch the warbling lyre."

"Gently stir and blow the fire,
Lay the mutton down to roast,
Dress it quickly I desire,
In the dripping put a toast,
That I hunger may remove—
Mutton is the meat I love.

"On the dresser see it lie;
Oh! the charming white and red;
Finer meat ne'er met the eye,
On the sweetest grass it fed:
Let the jack go swiftly round,
Let me have it nicely brown'd.

"On the table spread the cloth,
Let the knives be sharp and clean,
Pickles got and salad both,
Let them each be fresh and green.
With small beer, good ale, and wine,
O ye gods! how I shall dine!"

ANECDOTES.

John Dudley, of Deerfield, was a captain in the militia. He was an old bachelor, had an old maid for a house-keeper, and tilled his ground like an honest man. He was acquainted with Gov. Wentworth, and frequently called upon him when at Portsmouth, that he might tell his rustic neighbors how *thick* he was with his Excellency. To add to his importance he once invited the governor to call upon him at Deerfield, on his way into the country; and the governor promised to do so. The captain expected the visit some time in a certain week, and kept near his house busily employed as usual. One very warm day his house-keeper came pulling into the field to inform him that a grand carriage, which must be the governor's, was at a little distance. The Captain ran into the house and hardly had time to slip on his military red coat, and cocked hat, ere his Excellency drove up. With his trusty sword in hand, D. ran into the street, and assuming a true captain like strut, paid a martial salute to his Excellency, who on beholding him, burst out into a hearty laugh. This rather discomposed the man of the sword; but he was put to immediate flight by the following speech of the governor. "Captain Dudley, I am glad to see you, but think your appearance as a military man would be improved, if you were to add to your uniform a *pair of breeches*!"—an article which the good captain, in his haste to pay his respects, had entirely forgotten. *N. H. Hist. Coll.*

Equity.—A gentleman, travelling in a gig, in the vicinity of London, in coming to a turnpike, stopped for a ticket, and while the gate-keeper was procuring it, he threw the toll-money down in the road. The gate-keeper, with great coolness immediately took it up, and placed the ticket on the same spot, which the gentleman perceiving, and being anxious to proceed on his journey, requested him to take it up, but turning on his heels he said, "No, Master, where I *receives* my money there I *always leaves* my receipt;" and immediately left the gentleman to get out of the gig and take it up himself.

A lecturer on Chemistry was describing the nature of some of the gasses, when a lady present, asked the gentleman who attended her what was meant by the terms oxygen and hydrogen, and what was the difference. Very little, Madam, said the gallant. By oxy-gin, we mean *pure gin*; and by hydro-gin, *gin and water*.

A noted horse dealer lately remarked in a room at Aylesbury, where women were the topic of conversation, "Well, for my part I always keep clear of a grey horse, and a handsome wife. It is next to impossible to keep the former clean, and it is a difficult matter to keep the latter honest."—*Lon. Farmer's Journal*.

Moral Maxim.—Shouldst thou be visited with adversity, console thyself with the reflection that, however few of the other good things of this life may fall to thy share, the best of all things, which is innocence, is always in thine own power; and though fortune may make thee, in some degree unhappy, she cannot make thee completely, and irreparably miserable without thine own consent.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of *Mangel Wurtzel Seed*, raised by John Prince, Esq., Roxbury. April 21.

Agricultural Implements.

FOR sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchants' Row, a great variety of new and useful FARMING and GARDEN TOOLS, among which are the following, viz:—

Nixon's Patent Cast Iron Plough; Tice's do.; Seaver and Fay's do.; Wood's and Frechone's do.; Howard's Cast and Wrought Iron do.; Do. Wrought do. Do. Double Mould Board and Expanding do.; Sinclair Side Hill Plough; Beaton's Improved Scarifiers and Cultivators; Harrison's and James' Patent Corn Shellers; Jaquith's Threshing Machine; Willis' Patent Straw and Hay Cutter, the most improved and best constructed machine for the purpose ever invented. Once the above Machines is now in use and may be seen at a Niles' Livery Stable, Hawley Place.—Also, Safford's Patent Straw Cutters; Hand Straw Cutters; Bennet's Broad Cast Machine for Grass and other Seed; Cor and Turnip Drills; Steven's Patent Steel Spring Hoe and Manure Forks; Brade & Co's Cast Steel Hoes; Wright's Steel Plated do.; Common and Narrow do. Merrill's Steel Crook Neck do.; Iron and Steel Pot toe do.; Turnip and small Garden do. of all kinds; Garden and Pruning Shears; Transplanting Trowel and Forks; English and American Shovels and Spades; Bisbee's polished Cast Steel Back Strapped Shovel, new and very superior article; Cam's Cast Steel Scythe Brush and other Scythes; Common and Iron Teel Garden Rakes, together with many other valuable Tools.—Also, a New Improved Tree Brush for destroying Caterpillars.

GARDEN AND FIELD SELDS.

JOSEPH BRIDGE, No. 25, Court-street, has just received per London Packet, and for sale, an extensive variety of Agricultural and Horticultural Seed which added to his former collection makes the greatest assortment in New England—among them are: huskless early and late Peas, of various sorts; 150 lb Turnip, 100 lbs. RUTA BAGA, 200 lbs. Carrot, 10 lbs. Beet, 100 lbs. MANGEL WURTZEL, 50 lb Cabbages of sorts, Cauliflowers, 100 lbs. Radish of ear Lettuce of sorts, Endive, Kail, Celery, SALSAL, SCORZENERA, Onion, Leek, Sweet Marjoram Thyme, Sage, summer and winter Savory, Lavender, sweet Basil, Chervil, Fennel, Burnet, Grass Seed viz:—Herds, red and white Clover, Puro Meadow, Rye Top—with a large collection of ORNAMENTAL SELDS.

Garden Tools, viz:—Pruning and Budding Knife; Pruning Saws, Trimming Shears, Garden Reels and Line; transplanting Trowels, Rakes, Dutch or Pushing Hoe; Edging Irons.

Gosberry and Currant Bushes, Honeysuckles, Garden Roses, &c. 1200 Flower Pots with stands.

GREEN HOUSE PLANTS, a large variety, on constantly for sale, such as Roses, Myrtles, Geranium, Agapanthus, Orange Trees in fruit and blossom, R. Multiflora or Garland Rose, Mountain Daisies, Lauro tinces, &c. 50,000 THORNS or QUICKS for plantations.

ENGLISH CHEESE, and fine ENGLISH SPLICED PEAS. March 27.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for rendering LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 30, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

No. 42.

Domestic Economy.

ON BROILING. Cleanliness is essential in this mode of cookery.

Keep your gridiron quite clean between the broils, and bright on the top; when it is not, wipe it well with a linen cloth; just before you use it, rub the bars with clean mutton suet, to prevent the meat from being marked with the gridiron.

Take care to prepare your fire in time, so that it may burn quite clear; a brisk and clear fire is indispensable; or you cannot give your meat that browning, which constitutes the perfection of this mode of cookery, and gives a relish to food which it cannot receive any other way.

Be very attentive to watch the moment any thing is done; never hasten any thing that is broiling, lest you make smoke and spoil it. Let the bars of the gridiron be all hot and rough, but yet not burning hot on the surface; this is the perfect and fine condition of the gridiron.

As the bars keep away as much heat as their breadth covers, it is absolutely necessary they should be thoroughly hot before any thing to be broiled is laid upon them.

The bars of gridirons should be made concave, and terminate in a trough to catch the gravy, and keep the fat from dropping into the fire and making a smoke, which will spoil the broil.

CHOICE OF STEAKS. Those who are nice about steaks, never attempt to have them, except in a water which permits the meat to be hung till it is tender—and give the butcher some days' notice of their wish for them.

The best steaks are those cut from the middle of a rump, that has been killed at least four days in moderate weather,—much longer in cold weather—when they can be cut about six inches long, four inches wide and half an inch thick, so that you do not beat them unless you suspect they will be tender.

Take care to have a very clear brisk fire, throw a little salt on it, make the gridiron hot, and set it slanting, to prevent the fat from dropping into the fire, and making a smoke. It requires more practice and care than is generally supposed to do steaks to a nicety; and for want of these little attentions, this very common dish, which every body is supposed capable of dressing, seldom comes to the table in perfection.

The season for steaks, says the Cook's Oracle, is from the 29th of September to the 25th of March. The same publication gives the following directions for cooking steaks when taken out of season, or when there is otherwise reason to fear they would prove tough, if broiled without preparation.

Take two pounds of steaks and beat them all—line the bottom of a three quart stew pan with slices of fattish ham, or bacon, and on this lay the steaks, (which should be nicely trimmed and shaped;) just cover them with water, add a few corns of allspice, the same of black pepper, the red part of carrot, a little bundle of parsley and parsley, a large onion, with half a dozen cloves stuck in it, and a head of celery;—

cover them close, and let them simmer gently about an hour and a half, according to their thickness; if they are thin steaks, an hour may be enough; take care that the meat does not go to rags, by doing too fast, or too much.—When the steaks are tender take them up, flour them, and fry or broil them, only just to brown them.

Ask those you cook for, if they like it under, or thoroughly done, and what accompaniments they like best—turn the steak, &c. it will be done in about 10 or fifteen minutes; rub a bit of butter over it, and send it up, garnished with pickles and finely scraped horse-radish.

N. B. Macbeth's receipt for dressing a beef steak is the best—

—When 'tis done, 'twere well
If 'twere done quickly.

The Domestic Encyclopedia gives us the following as the most approved mode of cooking beef steaks and oyster sauce.

Strain off the liquor from the oysters and throw them into cold water to take off the grit, while you simmer the liquor with a bit of mace and lemon peel; then put the oysters in, stew them a few minutes, add a little cream if you have it, and some butter rubbed in a bit of flour; let them boil up at once; and have rump steaks, well seasoned and broiled, ready for throwing the oyster sauce over the moment you are to serve.

WHOLESALE MEATS. All meats are best when the animal is at maturity. Hence, to delicate persons, chickens, lamb, veal, pig, are not near so wholesome or nutritive as beef, fowl, mutton and pork.—*Dr. Willich.*

Fruit should be eaten before dinner, or as a supper. A meal of fruit, after a meal of meat, is more than the stomach can dispense with; especially with a meal of pies and puddings intervening.—*ibid.*

POISON FOR INSECTS. If walnut leaves be steeped in water for a few days, the fluid will acquire such a degree of bitterness, as to prove a certain poison for reptiles of every description.—*ibid.*

Correspondence.

POTATOES.

To the Editor of the New England Farmer,

SIR,—My neighborhood, generally, and perhaps without exception, have lost their potatoes as to size for sauce. They have become very watery, of a sweet sickish taste, and black in the middle, and the cause unknown as the like has not been known before.

Some of my neighbors dug their potatoes early, and others late, some kept them in cellars, and others buried them in the ground; and I cannot hear of any but what are affected in a similar way; they were very good when dug.

I publish this account by way of inquiry if any gentleman has known such a general circumstance before; or how to prevent it, he should publish it for the benefit of new settlements, where great use is made of potatoes.

SAMUEL PRESTON.

Stockport, Pa. May 1, 1824.

BY THE EDITOR. It is, we believe, a general rule in the economy of vegetation, that plants of all kinds, propagated by roots, slips or cuttings will degenerate, and in time become totally extinct. The finest fruits will not always last, and some of those formerly most celebrated in America and G. Britain are now known only by name, and their places are supplied by new varieties, perhaps of equal excellence. The same principle applies to potatoes, and probably all other roots, which should occasionally be renewed from seed, or their eventual destruction is inevitable. English farmers, we are informed, hold it to be absolutely necessary to renew their potatoes from the top seed once in fourteen or fifteen years. We do not pretend, however, to assert that such renewal will prove a complete remedy for the evils of which Mr. Preston complains, but the experiment is easily made, and some benefit will no doubt be the result.

The process for obtaining new varieties of potatoes is thus described in the *Farmer's Assistant*.

"Gather the apples or balls after the seeds are fully ripe; mash them in water till they are cleared of the pulp; then dry the seeds; and next spring sow them in a bed which is to be kept clear of weeds. In the fall, small potatoes will be found at the roots of the plants; and the different varieties of these are to be separately planted the next season; when they will produce potatoes of the usual size; and at this time the respective qualities of each variety can be ascertained."

An English publication directs to "Take the apples of potatoes, or potatoe balls, in the beginning of October, before the frost has hurt them. Hang them up by the foot stalks in a dry closet, where they will not freeze. Let them hang till March or April. Then mash the apples, wash the seeds from the pulp, and dry them in a sunny window. Sow the seeds in a bed about the first of May. When the plants are four or five inches high, transplant them into ground well prepared, one or two plants in a hill.—They will produce full grown apples, and some of the roots will be as large as hen's eggs."

We have no doubt but the general deterioration of the potatoes brought to market in this city, which has been a subject of complaint for some years past may be remedied in this simple and cheap manner.

LEACHED ASHES AS A MANURE.

Indian Hill Farm, West Newbury, Essex County, May 8th, 1824.

T. G. FESSENDEN, Esq.

Dear Sir,—Seeing an enquiry regarding Leached Ashes in the New England Farmer of this morning, with an appeal to your correspondents, I have concluded to send you my opinion—although I can only add two years' experience with that of the enquirer.

I would here remark, that enquiries generally made in your paper, though answered with a promptness by you, that subscribers in this quarter admire, receive no answer from your subscribers generally.—When I think of your long increasing list, and on that see names of men, not only distinguished by rank and fortune, but for well managed farms, and large crops; others in more humble life, though equally distinguished as honest men, (and who undoubtedly, have more leisure than the first mentioned,) refusing to answer enquiries, which, truly, to the man of experience may seem of little or no importance, but which in reality

are of the greatest consequence to us young farmers. I feel convinced 'tis a duty we all owe to answer enquiries—and although my limited knowledge, and little experience will prevent my giving an answer to one in ten of the enquiries, yet am willing to contribute that little, wishing if wrong to be corrected.

Respectfully, your ob't serv't.

BENJAMIN POOR.

Five years since this spring, I ploughed $1\frac{1}{2}$ acres low moist land, manured it in the common way with a mixture of manures, the principal part of which was leached ashes, which I had been led to purchase in consequence of seeing it shipped to New-York, by which I was informed the shipper in all cases made it profitable, as there was always a ready sale. The ensuing fall I had a large crop of Indian corn.—The year following I manured it in a similar way and had a good crop. The next year, after ploughing, and one harrowing, gave a light dressing of leached ashes and sowed barley and a quantity of herdsgrass and clover seed—then after twice harrowing the ground it was left. I think with Dr. Deane, that they are of but little use when ploughed in. Crops of grass have since been taken from that spot, which have far exceeded any in the vicinity for quantity on the same quality of land, as have some on two acres adjoining, which were broken up one year later, but managed and laid down in the same way; and at the same time, with the exception that the last were laid in beds about one rod in width. I have purchased leached ashes since, although the increased demand has enhanced the price one fourth part. Still, I think where grass or grain is wanted leached ashes are cheaper at four cents the bushel, the present price, or say \$1.60 for one cart load containing forty bushels, than stable manure at half that price; although stable manure is selling here this season at \$1.50 for one cart load containing forty bushels. In the spring of 1822, I had a field of five acres sowed with grain and grass seed; the ashes when hauled on the field, were laid in small heaps, and carefully spread. I consider, however, that it would have been much better to have spread them from the cart, as we could distinguish where each lay when the grain was cut also the last year when the grass was cut.

The last spring, 1823, we gave a light dressing to a steep side of a hill, which when mowed the year preceding was scarcely worth the trouble. The reason was, it had been formerly much ploughed, and being steep, every rain had washed it more or less—and as it was hard to plough it had been in grass a number of years. In applying the dressing early in the spring, we spread it carefully from the cart and as it was not perfectly fine, took rakes, and raked it lightly. The crop of hay amply rewarded for the labor and expense. I was this spring often asked by people residing at a distance, what I had done to the steep as it was green and totally different from what it had formerly. I think the present appearance justifies me in saying it will be greater this year than last. That may be owing to the favorable spring, but some say it is generally better the second year than the first.—I have heard many remarks such as your correspondent mentions, as that they left the land cold, &c.; but, no one made that assertion from experience. Such an one told him, that another heard, &c. was the nearest I could get to a reason.—When I first applied ashes to the

low land, I had not the faith I now have. But I ought to observe that the ashes I have purchased were leached for the purpose of making soap, consequently a quantity of lime was used which, in small quantities is said to be a great preventative to moss, &c. on lands.

REVIEWS.

Touche on Agriculture; including a Treatise on the preservation of the Apple Tree, together with Family Recipes, Experiments on Insects, &c. &c. By the Author of a Description of Brunswick, and other Towns in Maine. Portland, A. W. Thayer, Printer, 1821.

[Continued from page 314.]

At the close of our former remarks on this Tract (see vol. ii. page 314.) we promised some notice of the Author's Treatise on the Apple Tree; and will proceed to redeem our pledge. The author gives the following directions relative to the management of

THE NURSERY.

1. "Select ground, for a nursery similar if you can, to that on which you intend to set your orchard. Never make your nursery richer than you intend to keep your orchard; if you do, a vigorous start is given, that is not maintained in the orchard for want of its natural proportion of aliment."

"Put your trees in the nursery at least twenty inches apart. Most fail by crowding them; render them crooked and deformed. They are driven up like the tender growth in the dark forest, almost too slender to support themselves.

*NOTES BY THE EDITOR. It may not be amiss to observe that a dispute exists relative to the quality of the soil for a Nursery. Dr. Thacher says, (Am. Orchardist, page 30.) "it has been a received opinion, that the soil for a nursery should not be made rich, as the plants, when removed to a more fertile soil, will flourish more luxuriantly; but later observation has decided that the reverse to this will be found correct. There is a close analogy between vegetable and animal life; and it is a dictate of nature that both require a full supply of nutriment from their earliest existence. It would be absurd to suppose that the tender roots of young seedlings are capable of drawing sufficient nutriment from a rank, barren, and uncultivated soil, and those that are barely supported or nearly starved at first will never afterwards become vigorous, stately, and handsome, though surrounded by the richest mould. Repeated experiments have proved that a strong and vigorous plant, that has grown up quickly, and arrived at a considerable magnitude in a short time, never fails to grow better after transplanting, than another of the same size that is older and stunted in its growth.—Where the soil is poor and lean, trees in every stage of growth are observed to be languid, weak, and stunted; while those reared in a good mellow soil always assume a fine growth, and advance with strength and vigor."

On the other hand Judge Peters, of Pennsylvania, asserts that young apple-trees taken from a clay soil, and transplanted into one more suitable, thrive better than other apple trees, apparently of better quality, taken from a nursery, where the soil was congenial to their growth.

The "Farmer's Guide," a valuable work lately published by William Drown, of Providence, says, "we agree with a late writer in opinion, that the soil for a nursery ought to be naturally good, for at least one full spade deep, or if more the better; that a loamy soil, of a moderately light temperament is best, and that it cannot naturally be too good. It is very wrong to enrich nurseries with dung particularly until it is very old, and almost turned into earth. It is not absolutely necessary that the soil should be exceedingly rich, nor over carefully manured; a medium between the two extremes is best; such as any good substantial garden ground; or good mellow pasture land."

An apple tree wants body and the first branching limbs more than height. I have found almost universally the case, that the best bearing trees show you their extended bearing limb near the ground. This may depend on the distance in which you set your trees in the nursery, and the manner in which you use that ill-fated instrument the pruning knife, that man, intelligent farmers, while they are striving to save are ignorantly using to the ruin of the tree.* Keep the ground in the nursery level by piling rocks, or turfs about trees of any age you make an habitation for mice, rot the tree and make a lodgment for the worm.—Spare the prominent projecting limbs of the young tree prune off from the bearing tree till seven or eight years old, what sprouts you think will be useless, but never cut any so large, but that nature will heal the wound; risk to follow the process I will give, and need the deadly pruning knife to the next generation.

"We will take it, [the young tree] from the nursery and with some labor and care, saving the horizontal roots as long as possible; cut off the tap or perspire root. Make the hole large if the land be deep, springy and cold, put in a wheel-barrow load of small stones, if you are at a little expense to get them. This, if I may properly use the expression, will be everlasting manure in all soils. Coat these with an inch or two of dirt, throw a handful of potatoes into each hole under the tree, put a large potatoe at the end of every large root, the juice of the potatoe will nourish the tree at least for one season, if set out when it is ever so dry, and you may be sure of the life of the tree. Do not cut any of the roots inward, for most say, by doing it the limbs will be curled inward like wings, and then you will think it necessary to use the ill boding pruning knife. A few kernels of oats sown around the tree will keep the ground light. I have heard potatoes have grown five years in succession, put under the tree, and this may save the ground from binding, and prevent another fatal process of saving

*No doubt a pruning knife may be used in such a way as to become an instrument of destruction. Still it has important duties in the culture of trees. Mr. Cox says, as we think very judiciously, "When trees are much pruned they are apt to throw out numerous suckers from the boughs in the following summer; these should be rubbed off, when they first appear, or they may easily be broken off, when young and brittle—cutting is apt to increase their number. Trees differ much in their form, and require very different treatment in pruning; it may not be necessary in our warm climate to trim quite so close as in England, but great care should be observed to take off every limb, which crosses another, or is likely so to do at a future time; those who can conveniently do it, will find a benefit from *turning their heads in the nursery the year before they remove them*—when transplanted, they will thrive more rapidly from not having been pruned at the time of their removal, which in some measure exhausts and weakens the tree; I have been latterly in the habit of giving the principal pruning to my orchards after they have been planted out about five or six years; their growth, with proper cultivation, is then so vigorous, as to permit any natural defects in their forms to be corrected with safety, by free pruning, and forming their branches; the peculiarity of growth which characterizes each kind is then visible, and uniformity of shape may be more easily obtained.

"Apple trees should be so formed, as to allow man and horse to pass under them in ploughing; so a elevation of the branches, while it protects them from cattle, opens the ground to the salutary influence of the sun, and the crops of grain and grass."

ing the tree by ploughing, in which the unskilful may cut off one of the largest roots, that will, that must destroy as large a limb. No objection ploughing may loosen the ground under the hand of a careful master and invigorate the tree; but so far we cannot find as cheap, and in many instances, a safer method to rear and preserve a good and profitable orchard.—supposing you take 217 young trees from the nursery to set out 21 feet apart on an acre,* which is full enough on any land; the more rocky generally the better, if properly prepared, and the less stones you will need under your tree; when on deep intervals they may be made to flourish by not setting them too deep, and by putting a goodly portion of stones under them. It is on the richest intervals I have found most of the deadly enemies of the apple tree, lurking in the bark without the power of loco-motion: their destruction to the tree is almost universally attributed to cold;—one their greatest abundance is on a deep soil, where the parsnip root is allowed to run into the deep cold earth. I still follow an old notion marking my trees, when I take them from a nursery; set north, north. It is a well known fact that Indians will find their way through a forest in a dark night by feeling the bark of trees, which is always thickest on the north side; therefore follow nature in this, in fact in every thing relating to vegetation as a general rule. Any kind of manure you are disposed to put around a tree, put at least a foot from it, to let the roots always be covered. It is possible the eggs of some insects may lay near the surface, and by cutting with a hoe around a tree before winter sets in, they may be destroyed, ground loosened and the tree saved from many wounds by careless ploughing. Most insects depend on the ground too deep to be easily destroyed. The grub or cut worm descends four feet.”

(To be continued.)

* You cannot set out more than about 75 young trees on an acre 24 feet apart.

from the Mechanic's Journal; a periodical work lately established in London.

ON THE COFFEE SHRUB, COFFEE BEAN, AND COFFEE DRINK.

The coffee shrub is a plant of the same family as madder, namely the rubiacea of Jussieu, and is arranged by Linne in his class pentandria, and order monogynia. There are several species of coffee; but the only one cultivated for use is the Coffea Arabica of modern botanists. It is a native of the Upper Ethiopia, and grows about 14 or 20 feet high: the branches come out in pairs opposite each other, and crossing the pair of branches that come out below and above them; the leaves are somewhat like those of the bay, but less dry, and thinner; the flowers are white, and succeeded by a berry like a cherry, filled with yellowish pulp, and seven small horn-like beams, flat and grooved on one side, and convex on the other.

It was a few years before 1500 that the infusion of these berries came into use as a general drink, and it has slowly extended itself through most parts of the civilized world; except China, England, and Mexico, in which the use of it is more common than that of coffee drink.

It was probably the elastic horny nature of

these beans, which renders them very difficult to powder or for water to penetrate, that originally led the users of coffee drink to roast the beans to a brown colour, in order that they might grind them more easily, and extract the virtues of it the more speedily. The roasting not only perfectly answers these purposes, but also develops the aroma or odorous principle of the coffee bean.

In order to roast coffee properly the uses of roasting must not be lost sight of, namely to destroy the horn like tenacity of the green bean, and to develop its fine scent. Too much heat would destroy the chemical elements, which ought to be preserved, and would substitute in their place others which are of an entirely different quality. That fine scent, which pleases so greatly the admirers of good coffee is succeeded, where the coffee is over roasted, by a bitter taste, and burnt smell, which is far from being pleasant and even disagreeable. If, on the other hand, the roasting process is under-done, and the heat to which the beans have been exposed, has not been sufficient, then the raw smell of the coffee remains, and of course diminishes the aroma, which requires a certain heat to develop it. There is of course a just medium to be observed. Well roasted coffee ought to have a pale chocolate color equally spread over it, which is well known to those who are in the use of performing this operation, but it is never necessary to look at the roasted beans, the scent is sufficient; for when the true aroma is developed, and fills the surrounding atmosphere with its delicious scent, then it is time to stop the roasting. After this period the oil acquires a burnt flavor, a scent somewhat resembling that exhaled by smokers of tobacco is perceived, and instead of good roasted coffee there is obtained a bad kind of charcoal.

Considering the importance of this operation, it is no wonder that some of those who are very fond of coffee drink, although they would feel ashamed in busying themselves in any other department of household economy, yet do not hesitate to roast their own coffee, not only at home, but with their own hands. The fragrance diffused by the roasting seems to delight them; and they appear to enjoy by anticipation, the pleasure they shall feel in drinking of the infusion.

Good raw coffee loses from 16 to 20 per cent. of its weight by roasting; if it loses more it is certainly over-roasted. Many different modes are used, and each has its admirers; but there is, in fact, only a single rule to be observed, namely, to use the proper degree of heat, and keep it up at the same point till the roasting is finished. Whether the roasting is performed in close or open vessels; whether the coffee is left to cool in the roaster or is turned out, or even laid between cloths appear indifferent. If indeed the roasting by accident is carried too far, the coffee should be immediately spread out thin on the floor to cool it as soon as possible. In all cases, when cool the roasted coffee should be put into tin plate boxes, and kept from any moisture.

The chemists have made comparative analyses of raw and roasted coffee, of which some account may hereafter be given; but at present there is room only for detailing the best modes of making the coffee drink.

It being well known that the action of solvents

is hastened, in general, by reducing the solvent to powder; it is necessary to grind the roasted coffee more or less fine, as it is intended to use water less or more heated. To reduce coffee to too fine a powder, although it would require only slightly warm water to extract its soluble parts, yet it would be inconvenient in other respects, for the powder would pass through the strainers of the coffee pot, and by also remaining suspended in the water, would render the clearing of a drink difficult. At all events roasted coffee should never be ground, but the moment before it is used, as otherwise it loses much of its fine scent.

It now remains only to say a few words respecting the making of the ground roasted coffee into drink,—and here the grand points are not to lose the fine aroma, and not extract the bitter acrid, resinous element of the coffee. To avoid both these inconveniences, it is necessary that the coffee drink should not be made with too much heat; as this would dissipate the aroma in vapours, and cause the water to dissolve the resin. The coffee therefore must not be boiled in the water, and still less is it proper to boil the grounds over again with fresh water, as is done by some persons. Coffee drink made from the grounds, when it is added to that made from fresh ground coffee, gives it indeed a fine deep color, but the taste of the drink is very bad.

It is not even necessary to pour boiling, or even warm water upon the ground coffee: cold water, if sufficient time is allowed, makes equally good coffee drink, for the elements to be extracted from the roasted coffee are extremely soluble in water. But if the coffee drink is required to be prepared in haste, hot water must be used.

It is universally agreed on by the French amateurs of coffee, that coffee drink is never so good as when after being made with cold water, or with hot water, and cooled, it is heated over again, carefully avoiding a boiling heat. This heating over again is supposed to cause the various elements which produced the fine flavor of this drink, to unite more intimately; and this may be the real fact. The excellency of the coffee sold at Paris is well known; and this is always made one day and heated over again the next day when wanted. A further advantage attends this knowledge of consequence to single persons, who in summer time do not keep a fire in their chambers, that by merely pouring cold water on the ground coffee over night, and straining it in the morning, the strained liquor may, while they are dressing, be heated sufficiently for drinking, over a lamp; and this gives coffee a superiority over tea for the breakfast of such persons; as tea requires the water to be boiling hot, in order to extract its virtues; and of course requires a fire to be lighted.

From the American Farmer.

“Prevention is better than cure.”

GAFFES. Take a piece of asafetida about the size of a hen's egg; beat it tolerably flat; and wrap a piece of cotton cloth round it, and nail it to the bottom of the trough where the hens are daily watered: this method is adopted in the spring of the year, when the hens begin to bring forth their young broods, and it will be attended with invaluable success in preventing that destructive disorder.

RUSTICES.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.
No. IV.

Thus we see, that although one of the ladies who have made the important discovery of the conversion of a native grass into a costly bonnet, was suffered to pass with empty praise, by all the patriotic Societies in the United States, her labors have been made one source of national wealth to England, and that from a consciousness of their importance, and as a grateful return for her liberality of conduct, she has been generously rewarded by the London Society. We see also that Mr. Parry, one of their own countrymen, has been complimented with a large silver medal for the manufacture of Leghorn plat, from straw imported from Italy: and lastly, to prevent all interference with home industry in the manufacture in question, the government have laid a duty of 3*l.* (\$13, 33) per dozen on imported plats, and 17*s.* (\$3, 07) a lb. on the plat not made up, and a duty of five per cent. ad valorem on the imported straw from Italy.

The business of promoting the manufacture of straw and grass bonnets, has engaged the attention of Cobbett, who has prosecuted it with his well known zeal; and he has lately been presented by the same London Society, through their President the Duke of Sussex, with a medal, value 15 guineas, (\$70,) for his fine straw hat made from British materials, and for his exertions in drawing the attention of the British public to the manufacture. He says very justly "thousands of pages of biography are filled with deeds, none of which deserve to be mentioned on the same day with this act of Miss Woodhouse." (July 19, 1823.)

The merchants of Salem, Mass. probably did not know of these "doings" in England, but they evince most clearly how little the enemies of the New Tariff are authorized in saying, as they daily do, and as they themselves did in their memorial to Congress against it, "that the Statesmen of the old world are relaxing the rigor of their own systems, and yielding themselves to the rational doctrine, that national wealth is best promoted by a free interchange of commodities upon principles of perfect reciprocity."

The first thing done by Cobbett, was to search for the same grass in England as that sent by Miss Woodhouse to the London Society; and then to try experiments with other native grasses of that country, in order to see whether they would not answer equally well with the American species. He says (July 19, 1823,) that he had found the American grass, and had just then cut and bleached plants of it in his little cow pasture at Kensington, his present place of residence. The same grass abounds in England, and he has made some as bright as Miss Woodhouse ever made, some of it was as fine as the hair of her head.—one of his correspondents, a Mr. Clarke, made some beautiful plat from the sweet vernal grass.*

The official return of the number of straw

hats imported into England from Leghorn, during the years 1820, '21, '22, and down to April 1823, was 366,128; and in 1823, 3512 lbs. of plat were imported. The duty upon each hat was five shillings and eight pence sterling.—The whole amount of duty on the above number was therefore \$461,427,48. If, says Cobbett, we succeed in the manufacture, only think of the quantity of hats that are wanted in South America, the West Indies and the United States, only think of the magnitude of the thing! not less than five millions of people in this kingdom, wear these straw hats. (Jan. 21, 1823.) "It would be no trifling thing to take this article of Leghorn hats out of our custom house books; but this is a trifle, compared to the extension of the manufacture; to the introducing it into houses and families; to the making it the means of employing and of feeding without pauperism, a large portion of the laboring people. Colbert was immortalized on account of his encouragement of certain manufactures. I am greatly deceived if he ever encouraged any thing of greater importance to France, than this is to England." (July 19, 1823.)

Now, on the supposition that Cobbett, aided by the Society for the encouragement of arts, and by the governmental duty on imported Leghorns and straw plats, succeeds in making good his promise to the British public, to knock up foreign trade in those articles in England, the treasury of the country will be deprived of this great source of revenue; yet we see, the fear of this loss does not interfere with the prevailing and commendable policy of the government, and the patriots of England, of protecting home-industry; because they know, that unless the poor support themselves by labor, they must be supported by the public; and experience has taught them, that poverty and increase of crimes are closely connected. They also know that it is of much more importance to provide employment for poor women and children in England, than to add to the national coffers, by duties paid for a foreign fabric, which can be made at home; and that what the revenue loses by the cessation of the importation of the bonnets, will be made up by the produce of the returns for the English bonnets exported, by the duties paid by the articles constituting those returns.

Our Congress unfortunately do not reason in this plain common sense way; all they look to is present revenue, and are indifferent to the appalling spectacle of 25,000 women and children thrown out of employ, in consequence of the domestic manufactures of bonnets being suspended, and by reason of the want of a foreign market, and a deluge of cheap bonnets from Leghorn.

Cobbett very justly says that he 'is thoroughly convinced, that the causing of one new apple tree to be introduced,* or the causing of one Leghorn hat to be kept out by an English one, are ten thousand times more value to the country, than the library of the late King, which is to cost the nation forty thousand pounds for a place to put it in.' This is a much more sound doctrine than the hackneyed and common place saying of Dean Swift, respecting the merit of a man in making two blades of grass grow where one grew before. I will fearlessly assert in

like manner, that the keeping 25,000 women and children at work, (who will be thrown out of employ by the destruction of the bonnet manufactory in New England,) is ten thousand times more important to the people of the United States, than all the Societies for colonizing the blacks; for converting the people of India and China to christianity, or for ameliorating the condition of the Jews" in Europe, and for coaxing them to come to the United States, a country, which furnishes so small a scope for the indulgence of their prevailing passion; and most sincerely regret to see amiable ladies engaging in such comparatively useless, and certainly impracticable projects, when such a noble object as the encouragement of the straw and grass bonnet manufactory, exists for the exertion of their benevolent talents, but remains unattended to.

A Friend to Agriculture, Commerce and Manufactures

From the Old Colony Memorial.

FRUIT TREES.

Every friend to the science of horticulture, must be gratified with the attention bestowed on the subject, and the improvements which are making at the present day. Employment in this branch of agriculture, is both salutary and profitable, and it is commendable in every individual to contribute to its improvement. Our knowledge, however, of the physiology and of nature's laws, which govern in the vegetable kingdom, is quite too limited to justify conjectural assertions for facts substantiated by experience and observation. Theory or hypothetical disquisition will neither instruct nor satisfy the unlearned class of the community, who aspire only to practical knowledge derived from well established facts. It appears that a writer in the American Farmer, in a piece which is copied into other papers, has hazarded the positive assertion, that the common practice of white washing trees is highly detrimental to their growth, and that, if persevered in, will prove fatal to the trees. The writer predicates his doctrine on the principle that the application of white wash obstructs the pores and impedes perspiration from the bark of the trees. But it is unfortunate that we are too prone to step beyond the limits within which our actual knowledge ought to confine us. The supposed analogy between animal and vegetable life is problematical; and a cause, which in one case may derange the functions, may in the other be productive of salutary effects. In the winter season when the sap has receded from the trunk, and the exhalant vessels being in a quiescent state, there can be no perspiration, and before the sap receives the vivifying principle in the spring, the white washing is generally applied, and it adheres to the tree but a few weeks. It is well understood that in the summer season the leaves are the organs which perform the functions of inhalation and exhalation, in a manner similar to the lungs in animals. Whether these with the roots are capable of subserving all the purposes of vegetable life for a limited time, I presume not to decide, but am ready to declare my disbelief that the subtle fluid which transpires from the pores of trees can be impeded by a thin coat of white wash. Lime attracts moisture from the atmosphere until it becomes saturated, and why may

* This grass is also a native of the United States, and flowers before any other in Pennsylvania, where it abounds on land manured by sheep. It is the *anthrion odoratum* of the botanists so called from its odour when dried.

* Cobbett has introduced and sold grafts and numerous American apple trees in England. Register, July 19, 1823.

not absorb the perspirable fluid from the bark of trees? But it is best to agree with the facetious poet, that "no argument like matter of fact is." It is a fact that the practice of whitewashing trees has been followed for several years and not a solitary instance of its injurious effects has ever occurred to my observation, it on the contrary there are not wanting the most ample attestations in favor of its great utility. The trees being more vigorous and healthy, the bark more smooth and free from moss than ever before. If, however, we must be governed by fashion, and the fashion has had run, let it be discarded. In the American Gardener and in that valuable paper the New England Farmer, other compositions which may prove equally salutary are recommended. But there is another topic brought into view which is on its gross absurdity is liable to animadversion. It is asserted in an English paper that caterpillars may be destroyed by a clod of earth moulded round the top of the trunk of trees infested with these reptiles. The writer must be entirely ignorant of the natural history of the caterpillar. They are hatched in the spring from eggs deposited on the branches and twigs of trees the preceding summer.—They manifest no kind of antipathy to the earth, as they are frequently seen to traverse it without reluctance, nor have they occasion to ascend the trunk of the tree, for it is on the branches that they have their birth.—The most credulous reader, therefore, not having faith in magic, must smile at the supposition, that a clod of earth will prove so powerful an antidote as to kill or force the reptiles to abandon their possessions. But in all professions there are those who delight in quackery, pride themselves in some nostrum or new discovery. The sagacious editor of the New England Farmer in copying the article expressed doubts respecting the efficacy of this novel discovery, but by another pen we are gravely informed that though the experiment had been known to fail, yet when the *sod* had been applied to the nest it succeeded better than any thing which he ever tried! Let those then who may choose to climb into the tree be careful that they do not ascend the caterpillars' nest and crush the reptiles, but nicely adjust the sod and wait patiently till its shall display its magical powers.—Such exploits may vie with the French Mountebank, who among other nostrums, boasted of an infallible powder to kill fleas with the assurance that if there are millions of them his powder will destroy them all. The nostrum was readily purchased at a high price, but a person desiring to know how it should be applied was answered that he must take the flea by the back and squeeze him until he gapes, then dip a little of the powder in his mouth and swallow it.

There is yet another circumstance connected with this subject deserving of attention. It too frequently happens that cattle are permitted to have access to fruit trees in the winter season—they never fail to nip off the twigs of the last year's growth and break down the small branches within their reach leaving the ends jagged and unseemly. The only remedy for this evil is to cut off the jagged ends close up to the next bud. When this is neglected the broken ends die and become rotten and eventually prove essentially injurious to the whole tree. J. T.

From the Brunswick Times.

CULTURE OF WOAD.

Having seen in your paper an extract from the Aurora, giving an account of the uses and cultivation of the Woad Plant (or *Isatis Tinctoria*) as a substitute for Indigo, and believing that whatever may be found a useful substitute for any foreign article imported into this country, employed in our domestic or family manufactures, tends not only to render us independent of foreign nations, but, with some attention, may become sources of wealth to our industrious farmers and citizens, I have annexed herewith some further account of this valuable plant, which I should be glad if you would publish for the benefit of my brother farmers; not doubting, that if generally known with what ease this plant is reared and prepared for use, that every lady who is in the habit of making cotton, linen, and woollen cloths, for private use, would, instead of running to the shops for indigo, procure a small quantity of the woad seed and cultivate in her garden a very small spot, being sufficient to raise seed enough to sow two or three acres. This plant may be sown any time previous to the first of August, either in the broad cast way, or in the same manner as carrots and parsnips are generally sown, and its leaves are fit for use the summer following. It is biennial, the lower leaves are of an oblong oval figure, thick, ending in obtuse roundish points of a lucid green. The stalks rise about four feet high, dividing into several branches, terminated by small yellow flowers. The time for gathering the crop is about the end of June, or whenever the leaves are fully grown, while they are perfectly green. If the land be good and the crop well husbanded, it will produce three or four gatherings; but the two first are the best, and will produce three or four times as much coloring matter as the third and fourth crop.

The leaves in the large way are carried directly to the mill, with a stone running on the edge resembling the oil or bark mills, where they are mashed into a smooth paste: if this process is deferred, they would putrify. The paste is then laid in heaps, pressed close and smooth, and the blackish crust, which forms on the outside, reunited if it happens to crack.—After laying for fifteen days, the heaps are opened, the crust rubbed and mixed with the inside; it is then formed into balls, which are pressed close and solid; these are dried upon hurdles; they turn black on the outside if in the sun, if in a close place yellowish; if the weather is rainy, the first is to be preferred.

The good balls are distinguished by their being weighty, of an agreeable smell, and when rubbed, of a violet color within. Woad not only affords a lasting and substantial blue, which may be reduced into many different shades, but is of great use in dyeing and fixing many other colors.

In the small way the leaves may be pounded in a trough or wooden mortar, laid smooth in heads, as above directed; and after laying some days the outside crust rolled with the inside, and made into small balls, about the size of a coffee cup, in any convenient vessel which will bear pressing strongly to mould them in: and if the balls happen to crack before they are thoroughly dry, they may be rubbed together,

moulded over again, and dried on boards in the sun. Woad and indigo are frequently used in conjunction, which makes a very great saving to the dyers. In dyeing blue with these substances, it is usual to mix 400 lb. woad, 30 lb. madder, 8 or 9 lbs. lime, and from 10 to 30 lbs. indigo, and a quantity of bran, which are put at different times in a wooden vat and digested with a strong heat for several hours, after which the substances to be dyed are immersed in the mixture.

Silk, woollen, linen, and cotton are alike dyed with these ingredients, but with some variation of the proportions. A solution of woad and indigo in sulphuric acid forms what is called the Saxon blue. For dyeing yarn in the small way, woad may be used in the same manner as indigo; or a proportion of the ingredients before mentioned may be added; but the best color will be produced by using each in the proportion of one ounce of indigo to twelve ounces woad; the latter gives solidity and substance to the color, the former brightness.

The woad was once the great staple of Languedoc, is now cultivated generally in France, Spain, Portugal, Germany, Switzerland, Sweden, and in many parts of England, and in the small way in America. The produce of an acre of ground from woad may be estimated to be worth from one to two hundred dollars.

That the farmers and dyers may make trial of woad, induces this communication.

A MIDDLESEX FARMER.

From Long's Expedition to the Rocky Mountains.

A singular description of food is made use of by some tribes of the Snake Indians, consisting chiefly and sometimes wholly of a species of ant which is very abundant in the region in which they roam. The squaws go in the cool of the morning to the hillocks of these active insects, knowing that then they are assembled in the greatest numbers. Uncovering the little mounds to a certain depth, the squaws scoop them up with their hands and put them into a bag prepared for the purpose. When a sufficient number are obtained, they repair to the water, and cleanse the mass from all the dirt and small pieces of wood collected. The ants are then placed upon a flat stone, and by the pressure of a rolling pin are crushed together in a dense mass, and rolled out like pastry. Of this substance a soup is prepared, which is relished by the Indians, but is not at all to the taste of white men.

Gas Lights.—Professor Olmsted, of the University of North Carolina, has ascertained, that a fine illuminating gas may be obtained from cotton seed. The produce of gas from a bushel of seed, is more than double the average product of the same quantity of New Castle Coal, and greatly exceeds that in illuminating power. It partakes of the purity and splendor of gas from oil, with which substance, indeed, this seed is known to abound. The experiments already made, induce the belief, that, among all substances hitherto tried for gas illumination, this article will be found the most eligible, especially for our southern cities, where cotton seed can be obtained at a very trifling expense; and the idea suggested that this article may possibly become of considerable value for exportation.

Spinning Machines.—It is stated that Mr. Gilbert Brewster, of Norwich, Conn. has already made of his improved machines for spinning wool, to the amount of upwards of \$200,000, and has orders for more machines to a very large amount. He has made large machines at the price of \$2,700, and has made this declaration, that if any person will take one of his machines and put it into full operation for two years, and give him the savings made between this machine, and the old or common modes of spinning wool, he will give the machines without any further charge. The English spinner, cannot spin for less than 2 pence or 3 pence per lb. Mr. Brewster's machines facilitate the spinning so much as to have reduced the price to *one cent per lb.* And not only the best merino wool can be spun at this price, but even the finest Saxon so much superior, even to merino, and of which the finest and highest priced cloths are made.—*N. Y. paper.*

NEW ENGLAND FARMER.

SATURDAY, MAY 15, 1824.

FARMER'S CALENDAR.

MANURE. If you have not cleared your barn yards, and other receptacles of manure of their fertilizing contents you will please to set about it. If you have more dung than you propose to use immediately, do not suffer it to lie scorching and drenching in the sun and rain, unless you mean to be poverty-stricken before you think of it. If your cattle are yarded nights, you will be so good as to get up half an hour earlier than you commonly rise, and shovel what manure they have left under your shed, and then cover it with about as much mud, loam, or something else which will answer the purpose, as there is of the dung. You will thus in a little time obtain a compost as rich as Cresset, and fill your money-bag with hard dollars, or your pocket-book with good bank bills. The weeds which you cut up in your garden, &c. you will either throw to your hogs, bury in trenches between your rows of plants, throw into heaps and cover with earth, or carry them to your compost bed and cover them there.

FENCES. Take another look at your enclosures and see that your fences are sound, firm, high and close. If you do not, and should unhappily wake up some morning and find your cattle in the corn, your pigs in the peas, &c. you will please to recollect that we told you so. After planting and before weeding you will probably have time to make some excellent stone wall. See that you make it where it is most needed, and what you make should be well made. We do not much admire certain apologies for fences, which we every now and then come across, in the course of our agricultural tours. A jagged, cobbling, half-built wall, in which the stones look as if they were huddled together by chance, or an earthquake, not at all disposed to be sociable, but each seems to say to its neighbor, please to keep your distance, is an abomination on any man's farm. We have seen too many such rough monuments of laziness, which seem to have been tossed together for no other purpose but to afford the quadrupeds of the place the means of taking practical lessons in the art of jumping.

PASTURES. Take a scrutinising squint at your pastures, and divide your stock among them according to the best rules in such case made and provided. Do not, however, let your cattle into your pasture ground too early in the spring. You had better buy hay and keep them in your barn yard, or cut and carry browse to them or turn them into the woods to pick a living as they can, than let them make minced pie of your sward-ground, and nip off every spire of grass the moment it peeps from the surface of the soil. In common seasons from the 20th of May to the 1st of June is early enough to turn your stock to grass. Your laboring cattle and horses should be kept up still longer, or at least till the last mentioned time. Dr. Deane said that "cattle should not be let into any pasture until the grass is so grown as to afford them a good bite, so that they may fill themselves without rambling all over the lot. The dryest pastures should be used first, though in them the grass is shortest that the potching of ground in the wettest may be prevented. Milch kine, working oxen and fattening beasts should have the first feeding of an enclosure. Afterwards sheep and horses. When the first lot is thus fed off, it should be shot up, and the dung that has been dropped should be beaten to pieces, and well scattered, afterwards the second pasture should be treated in the same manner, and the rest in course, feeding the wettest pasture after the dryest, that the soil may be less potched.

"Something considerable is saved by letting all sorts of grazing animals take their turns in a pasture. By means of this, nearly all the herbage produced will be eaten; much of which would otherwise be lost. Horses will eat the leavings of horned cattle; and sheep will eat some things that both the one and the other leave."

It will not be proper, when you have turned your cattle to grass to overlook or neglect them. You should see every animal every day, if you rise an hour before the sun for that purpose.

If you turn hogs into a pasture they should have rings in their noses, or as some say, you will do as well to pare off the gristle of the nose, to prevent their rooting. It is, we believe, a good notion to have a sty to feed them in, with a door or aperture opening into a clover pasture of suitable dimensions, which should contain a brook or pool, for their Majesties to wallow in. While the clover is fresh they will need scarcely any other food, but now and then a little brimstone and cream of tartar to give them an appetite. The hogs should not be accommodated with too large a pasture, lest the grass should become so old and tough that they will not eat it. Short and sweet grass is necessary for this species of epicures.

We have it from good authority that sheep require no water in their pastures, calves none, and horses very little except they are worked. The consequence of such a privation we are told is that the animals feed at night, and lie still in the day time. Cows, however, should have water, and that of a good quality. Muddy, stagnant water, such as is made use of in order to manufacture mosquitoes and fever and ague in some of our western States, has a very bad effect on cows, reducing the quantity of their milk, and injuring its quality.

YANKEE INGENUITY. We are much amused, and highly gratified by our frequent visits to the Agricultural Establishment, No. 20, Merchants' Row, Boston. The inventive faculties of our countrymen are there indicated by a display of machines of almost as many forms as there were kinds of animals in Noah's Ark. Although they have not yet exactly, exhibited Mr. Godwin's plough, which would

— "Set itself to work
And plough an acre in a jerk."

they have ploughs, of excellent construction, which come very near and perhaps some of them are but little inferior to Mr. Jefferson's best of all possible ploughs described in Wells & Lilly's edition of Dr. Deane's New England Farmer, under the article "Plough," and very well known to scientific agriculturists in Europe as well as in America.

But the more immediate object of this article is to call the attention of the agricultural part of the community to two machines which we think are of singular utility.

1. An instrument for cutting up hassocks or small protuberances, in swamps and wet meadows, invented by Col. Samuel Putnam, of Danvers, Mass. This consists of a wooden frame of an angular form, somewhat like a common harrow, with an iron or steel appendage beneath it, of semi-elliptical form, bent inward with sharp edges. The machine is drawn by oxen, or horses, and the metallic part embraces the hassocks, or other protuberances, and cuts them off as smoothly as a barber could excise the criniferous excrescences of face without a wrinkle.

2. A new kind of churn, in which the dasher, or the part which stirs the milk or cream, is put in motion by an horizontal lever, to which the dasher is attached by cast iron gearing of the most simple, and effective description.

We know that our description will give but an inadequate idea of the above mentioned machine but we have not room at present for a more perfect account; and those who would wish for further information may call and inspect the machines at the establishment abovementioned.

SWEET CORN. By the kindness of "A Subscriber we have received two parcels of Sweet Corn for distributing gratis, among those who would wish to obtain small quantities for seed. There are two kinds of corn one of which ripens somewhat earlier than the other. We should be happy to present any of our friends, engaged in agriculture or horticulture, who will call send to the Farmer office, with a handful of each, to the parcels are distributed.

VANPARE OF THE OCEAN. A curious monster cycled is now exhibiting at No. 13, Brattle-street, Boston. It was an inhabitant of the deep, caught in the Atlantic Ocean, near the entrance of the Delaware and supposed to have weighed when first captured, between four and five tons. Dr. Mitchell, who examined and dissected it, when first taken, pronounced it to be "a fish considerably different from any seen before and unlike all the descriptions that I could find in the books." A particular description of this marine monster may be found in handbills which will be presented to visitors at the place of exhibition.

"There therefore needs no more be said here,
We unto them refer the reader."

ERRATA. Our subscribers will perceive that part of the pages of this day's paper, are, by mistake, numbered wrong; they may, if they please, correct them with a pen.

FOREIGN.

The last advices from Europe come down to the beginning of April, but are not of great importance. The Slave Trade Bill has passed both houses of Parliament and received the assent of the King. The difficulties between Great Britain and Algiers have been settled.

The occupation of Spain by French troops is limited to the first of July, unless the Allied Powers should deem it necessary that the period should be prolonged. Extensive preparations were going on at Constantinople for another Campaign against the Greeks.

It is stated that Corunna surrendered to the Greeks on the 8th February. They have also succeeded in taking out works of Lepanto.

A letter from Zante of March 23d, states that Lord Byron had negotiated a reconciliation between some of the contending Greek Chiefs, and had induced Theodore Colotroni to evacuate the important fortress of Lepanto, which was now occupied by the Patriots.

It was reported that the Vice Roy of Egypt had declared himself independent of the Porte, and had ordered his lieges to return home.

Advices from Madrid state that an order has at length been published, granting a general pardon to the military of the constitutional armies, with an exception that none of them are to reside at Madrid, or to inhabit the royal palaces. A civil amnesty was also under consideration.

DOMESTIC.

CONCORD, April 24. Anniversary of April 19, 1775.—On Monday last, the Concord Artillery Company, under Capt. Whiting, and the Light Infantry, under Capt. Jarvis, paraded in honor of the anniversary being forty-nine years since the first blood was shed in Concord and Lexington.

The day was ushered in by a salute of thirteen guns, and the reveille was beat by one who had often done the same duty in our revolutionary army.

At dinner, the few remaining patriots of this town, who were engaged in the battle forty-nine years ago, were at the table, and their presence gave life and reality to the scenes and deeds which were thus commemorated. Immediately after dinner, the company marched up to the former site of the north bridge. It was the spot where the British detachment under Col. Lowrie first fired at our men, under the gallant Major Buttrick and Capt. Davis, of Acton Minute Company, the latter of whom was there killed. When the companies arrived there, the Rev. Dr. Ripley made an instructive address, describing to them with minuteness the scene and circumstances as they finally took place.

The Davis Blues, of Acton, under command of Col. Davis, also paraded to commemorate the anniversary. It will be remembered that the Acton minute men were actively engaged at the Concord battle, and cost their commander, Capt. Davis, his life.

A circumstance of a peculiar nature occurred in Lexington in the house now owned by Mr. Priest, during the British retreat. As Mr. James Heywood of Acton, lingering a little behind the main body went back to the house for a draught of water, he perceived a British soldier coming through the house probably for some object. They were both armed—drew up their pieces—fired at each other—and were both shot dead at the same instant.

It must be gratifying to the surviving patriots of the Revolution to review the plains of Concord in 1775, and look around the country in 1824. It speaks favorably to the health of Concord, that there are so many that still live, who actually bore arms on the 19th April, 1775. It has been ascertained that there are twenty men now living in this town, who lived here at the time, and were actors in those scenes, and then took up arms in defence of their rights.

Champlain Canal.—This canal is said to be navigable from Whitehall to the Saratoga Dam; and is expected to be open all the way to the Hudson in a few days.

Extract of a letter, dated Washington, April 30.—“A Convention with England was this day read in the Senate, concluded by Mr. Rush, on the part of the United States, and Mr. Huskisson and Mr. Canby, late a Min-

nister to the United States, on the part of England, granting under regulation and restrictions, the right of search of American and English vessels, engaged in the slave trade. From hearsay, it is inferred that the right of visit and search, being duly restricted and regulated, little or no objection will be made to the Convention.”—*National Aegis*.

Murderous Rencontre.—The Port Gibson paper states, that about the 15th of March, Lt. Guino, of the U. S. Army, shot Mr. Verby, of Wilkinson county, through the heart, and he expired instantly. The duel was fought on the banks of the Mississippi.

Cheap Travelling.—The Rochester paper announces that packet boats now daily depart east and west on the Canal, and the fare is so good and cheap that no one who consults economy can now afford to travel on foot.

Dreadful Accident.—Mr. Amos Boyce and M. John Wright were killed in Pawtucket, on the 20th ult, by the sudden caving in of earth in a well in which they were at work. They were buried about an hour and an half; and when extricated were both dead. The well was sunk the depth of 28 feet, in a quicksand and no precaution was taken by curbing to guard against caving-in of the earth. A very little care, probably, would have effectually protected them from the calamitous event. Mr. Wright belonged to this town.

[Providence paper.]

CONGRESSIONAL.

IN SENATE.—Friday, April 30. Mr. Lloyd, of Mr. presented a memorial from Boston, against, and Mr. Mills a memorial from the same place in favor of the passage of the Tariff bill.

The Senate in committee resumed the consideration of the Tariff. Mr. Kelly, of Alabama, moved to strike out the highest rate of duty proposed on cotton bagging, which motion, after debate was decided in the affirmative. Yeas 28, Nays 19.

Saturday, May 19. After passing on numerous private bills, the Senate resumed the consideration of the Tariff bill, but nothing of consequence was decided on. Monday, May 3. Mr. Jackson, from the joint committee on the subject, reported that the two houses may have a recess on the 19th inst.

The subject of the Tariff bill was again resumed. The amendment proposed by Mr. Holmes, of Me. to exempt Russia duck and sheeting from the duty was the question before the committee; and after some discussion was rejected. Yeas 21, Nays 26.

Tuesday, May 4. The Tariff bill was again discussed, but no decision of any question obtained.

Wednesday, May 5. A motion made by Mr. Elliot to strike out the proviso in the Tariff, which establishes the minimum upon which the duties on cotton cloth, &c. are to be calculated, was decided in the negative. Yeas 23, Nays 24.

Mr. Holmes, of Me. moved to amend the bill by striking out the clause which allows fifteen per centum on the duties now imposed, on all foreign distilled spirits. This motion was decided in the affirmative. Yeas 28, Nays 18.

Thursday, May 6. Mr. Barbour submitted resolutions for the distribution of the present Tariff bill throughout the United States, in order to obtain information of its probable effects on the revenue, and on the shipping, manufacturing, commercial and agricultural interests of the community; which were ordered to be printed.

A motion of Mr. Smith to limit the duty on wool to 25 per cent ad valorem was negatived. Yeas 21, Nays 26.

A motion of Mr. Mills to limit the duty on unmanufactured wool to 30 per cent ad valorem was adopted.

A motion of Mr. Lloyd, of Md. to strike out the proviso that all wool, not valued at more than ten cents per pound, should be charged with a duty of 15 per cent was negatived. Yeas 18, Nays 29.

A motion of Mr. Smith to fix the duty on India silks, at 25 per cent was negatived. Yeas 12, Nays 35.

A motion of Mr. King, of N. Y. to strike out the highest rate of duty on woollens, leaving the duty at 30 per cent ad valorem until June 30, 1825, and afterwards at 33 1-2 per cent ad val. was adopted. Yeas 28, Nays 16.

Several other motions for sundry alterations, exemptions, &c. were made, and were all negatived.

HOUSE.—Friday, April 30. On motion of Mr. Tallant it was ordered that the Committee on Military Affairs be instructed to inquire into and report at the next Session of Congress the extent to which it is expedient to adopt the system of defence proposed in the several reports of the Board of Engineers, for the defence of the maritime frontier of this country, &c.

The report of the Committee on the claims of the heirs of Beaumarchais was discussed in committee of the Whole. Mr. Tucker explained the subject; when on motion the Committee rose. With an understanding that the subject should be resumed on Monday.

Saturday, May 1. Was occupied in attending to private and local business.

Monday, May 3. The subject of a recess being under consideration, Mr. M'Lane hoped the two Houses would not adjourn until the investigation was completed relative to the memorial of Mr. Edwards. After some debate, a motion to lay the report on the table was carried.

Mr. Hamilton, from the Military Committee reported a bill to authorize the settlement of the claims of the state of Massachusetts upon the General Government for services rendered by the militia of the state during the late war, exhibited a report, which concluded as follows:

Your Committee recommend that, in all cases where the militia of the state of Massachusetts were called out in conformity with the desire of an officer of the General Government, or to repel actual invasion, or under a well founded apprehension of invasion, during the late war, the claim of the state for such militia services be allowed, under the usual rules of auditing and allowing similar claims; provided the number of troops, so called out, were not in undue proportion to the exigency.

Your Committee likewise recommend that the claims of Massachusetts for militia services, not comprehended in the above description of cases, be disallowed. This report was referred to the Committee of the Whole.

The House in committee, took into consideration a remonstrance from the State of Kentucky against the decision of the Supreme Court of the U. S. on the subject of the occupying claimant laws of Kentucky. This caused a protracted debate, but no decision was obtained.

Tuesday, May 4. A bill concerning invalid pensioners, and one relative to the Post Office department were discussed without decision.

Wednesday, May 5. Mr. Corke offered a long resolution, requesting the President to give a detailed report on the system and plan of fortification, contemplated by him, and recommended by the board of engineers, &c. which was laid on the table. [Accepted the next day.]

Thursday, May 6. The Post Office bill was dismissed on the ground that the session was too far advanced to give it due consideration.

TO CORRESPONDENTS. We have received several communications, which are too late for insertion in this day's paper. They will be inserted in our next.

PRICES CURRENT.

Ashes, per ton, \$112, 50 a \$115; Pearl, do, \$117, 50 a \$120; Butter, No. 1, per lb. 10 a 12 cts.; Rye, per bush. 55 a 56 cts.; Plaster Paris, per ton, \$4; Herd's Grass, 1822, per bush. \$2 a \$2, 12. For other articles see last paper.

NEW GARDEN SEEDS.

JUST received by the London Packet, and for sale by GEO. MURDOCK, No. 14, Market-square, an assortment of GARDEN SEED, of the last year's growth, among which are, Early and Late Cauliflower, Early and Late Cabbage, Early and Late Peas, Sweet Marjoram and Thyme, ARNACK, MANGEL WURTZEL, RUTA BAGA, &c. Likewise—a few cases of MARASCHINO and CURACOA, a Cordial much celebrated in Europe—French Annisette in baskets of 2 bottles each—Welch's No. 1 Chocolate, Cocoa and Shells—green Madeira Citron, with other Groceries as usual.

Likewise—a few Hampers of Rich Cheshire and Loaf Cheese—London Brown Stent, in whole and half Bottles—English and French Mustard, in kegs and jugs.

From the Hancock Gazette.

Would Yankces still continue free,
Let this their honest motto be,
Our stock we'll raise ourselves, and keep,
From bellowing bull to bleating sheep;
In manufactures we will try
All foreign nations to outvie!
In mechenism try each *notion*,
Except to find perpetual motion;
In agriculture do our best;
And leave to gracious Heaven the rest.

Miscellany.

From the Portland Gazette.

USEFUL RULES FOR HOUSE-WIVES.

1. When you arise in the morning never be particular about pinning your clothes so very nicely; you can do that any time.

2. Never comb your hair, or take off your night cap (till after breakfast. It is your business to take time by the foretop and not let him take you so; therefore keep all night in that quarter till 10 o'clock at least.

3. When you begin the business of your toilet you may do it before the window or in the front entry; but the most proper place is in the kitchen.

4. Never have any particular place for any thing in your house; and then you may rest assured, that nothing will ever be out of place; and that is a great comfort in a family.

5. Never sweep your floor, until you know some person is coming in: he will then see how neat you are: and, besides, in such cases, even your enemies cannot shake off the dust of their feet, against you, though they may the dust of their clothes with which you have covered them by your sweeping.

6. When you have done sweeping, leave your broom on the floor, it will then be handy: and, being always in sight, and in the way, it will be constantly reminding your husband, when he is in the house, what a smart, nice, pains-taking wife he has.

7. Never follow the barbarous practice of brushing down cobwebs. A man's house is his castle: and so is a spider's.—It is a violation of rights; and a shameless disrespect to the fine arts.

8. Keep your parlour and bedroom windows shut as close as possible in dog days: this will keep the hot air out—and you will have excellent fired air inside.

9. Keep your summer cheeses in your bed chambers:—they enrich the qualities of the atmosphere: and if a stranger should lodge in one of your beds: if he could not sleep, he could eat for his refreshment.

10. Never teach your daughters to mend or make any of their own clothes, it is "taking the bread from the mouth of labour"—besides it will make them crooked and give them sore fingers.

11. But if they should insist on mending their own garments, they should do it while they are on: this will make them fit better: and Girls can't leave their work: if they should attempt it their work would follow them.

12. If your husband's coat is out at one of the elbows, don't mend it until it is out at the other; then the patches will make it appear uniform; and shew that you are impartial.

13. Never spoil a joke for a relation's sake; nor suppress the truth for any body's sake. Therefore, if you don't like your husband as well as you ought—out with it, and convince him you are not a respecter of persons.

14. You should endeavour not to keep your temper:—let it off as soon and as fast as you can; and you will then be as calm and quiet as a bottle of cider after the cork has been drawn half a day.

15. If, on any particular occasion, you are at a loss as to the course you ought to pursue, in the management of yourself or your family affairs, take down the paper which contain these Rules and read them over and over till you have satisfied your mind—and then go on.

POOR RICHARD.

Condensation of Various Gases into Liquids.—In the Philosophical Transactions of London, Part II. are detailed the very important results of Mr. Faraday on the condensation of gases into liquids. By submitting solid compounds, containing gaseous elements, to heat, in sealed glass tubes, or by extricating by chemical reaction, from other substances similarly confined, various gaseous products, so great a pressure was produced, as to cause the liquefaction of the gases produced in the several experiments.—The following is a list of gases condensed up to the present time, namely: Chlorine, Muriatric acid, Sulphurous acid, Sulphuretted hydrogen, Carbonic acid, Euchlorine, Nitrous oxide, Cyanogen, and Ammonia.

Application of Liquids, formed by the Condensation of Gases, as Mechanical Agents.—Sir Humphrey Davy has given a paper on this interesting subject in the same Part of the Phil. Trans. above referred. After expressing some doubts as to the economical results to be expected from employing the vapors of water or alcohol, under high pressures by high temperatures, as mechanical agents, from the great loss of radiant heat at high temperatures, and from the extrication of latent heat by compression, and its absorption from expansion; no such doubts, he considers, can arise respecting the use of the vapors of liquids, which require, for their existence, a pressure, equal to 30 or 40 atmospheres, and which exert an immense elastic force at common temperatures, or from slight elevations of them. Such liquids are the liquefied gases.

It is not easy, in a short notice, like the present, to make the whole ground of Sir Humphrey Davy's reasoning intelligible to the generality of readers, involving, as it does, the more abstruse doctrines on the subject of caloric; but a general idea of his exceedingly novel views on the manner of applying the condensed gases as mechanical agents, may be obtained from the following extract from his paper.—*Port Folio.*

"In applying the condensed gases as mechanical agents, there will be some difficulty; the materials of the apparatus must be at least as strong and as perfectly joined as those used by Mr. Perkins in his high pressure steam-engine: but the small differences of temperature required to produce an elastic force, equal to the pressure of many atmospheres, will render the risk of explosion extremely small; and if future experiments should realise the views here developed, the mere difference of tempe-

ture between sunshine and shade, and air and water, or effects of evaporation from a moist surface, will be sufficient to produce results which have hitherto been obtained only by great expenditure of fuel.

Singular Chastisement.—A spruce little gentleman, who, during the summer season, is employed as a waiter of one of the Inns in Harrogate, called to regale himself at the Elephant and Castle Knaresborough, on the evening of the fair, and while in his cups, became exceedingly noisy and quarrelsome with the rest of the company, drinking off their glasses *saucer ceremonie*, and, if a remonstrance was made, a challenge to fight was the immediate consequence. At length an honest athletic farmer, to whom he had "shown fight," whipped the dapper hero under his arm, and cramming him into a sack, tossed him into his cart, which stood at the door, and drove down the street to the distance of a mile from the town, where he was unbagged, to the great amusement of a vast number of spectators, and to the evident improvement of the manners of the offender.

Literary Discovery.—A Latin MS. undoubtedly by Milton, long supposed to be irrecoverably lost, has just been discovered at the State Paper Office. The subject is religious, and the arguments are all drawn from the Scriptures. There are many Hebrew quotations, and the work is one of considerable bulk, as it contains 735 pages, many of them closely written, and believed to be in the hand writing of the poet's nephew, Philips, with many interlineations in a different hand. It was found in an envelope addressed to Cyriac Skinner, Merchant.—The situation which Milton held, of Latin Secretary to Cromwell, will account for such a discovery being made in the State Paper Office.—*London paper.*

Progress of Liberty.—A writer in the London Monthly Magazine has given a sketch of the progress of free institutions, from which we learn, that in 1775, the number of free men living under free governments, was 15,800,000. He computes the number, at this time, to be 87,200,000.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending **LEADING IMPROVED LEAD PIPE**, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

March 27.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of Mangel Wurtzel Seed, raised by John Prince, Esq., Roxbury. April 24.

WANTED Nos. 14, 43, and 45, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper.

TERMS OF THE FARMER.

Published every Saturday, at **THREE DOLLARS** per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscribing will be entitled to a deduction of **FIFTY CENTS**.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

Domestic Economy.

CHOOSING AND DRESSING POTATOES.

Highly extracted and abridged from the Cook's Oracle.

The vegetable kingdom affords no food more wholesome, more easily procured, or less expensive than the potatoe; yet although this most useful vegetable is dressed almost every day, in almost every family,—for one plate of potatoes that comes to the table as it should, nine are spoiled.

Choose potatoes of a moderate size, free from blemishes, and buy them in the mould; they must not be wetted till they are cleansed to be cooked. Protect them from the air and frost by piling them in heaps in a cellar, covering them with mats, or burying them in sand or in earth. The action of frost is most destructive.

Wash them, but do not pare or cut them unless they are very large,—fill a saucepan half full of potatoes of equal size, or make them so by dividing the larger ones, put to them as much cold water as will cover them about an inch: they are sooner boiled and more savoury in when drowned in water—most boiled potatoes are spoiled by having too little water; potatoes are often spoiled by too much;—they must merely be covered, and a little allowed for waste in boiling, so that they may be just covered at the finish.

Set them on a moderate fire till they boil, then take them off, and set them by the side of the fire to simmer slowly till they are soft enough to admit a fork,—(place no dependence on the usual test of their skin cracking, which if they are boiled fast will happen to some potatoes when they are not half done, and the inside quite hard,) then pour the water off, (if you let the potatoes remain in the water a moment after they are done enough, they will become watery and watery,) uncover the saucepan, and set it at such a distance from the fire as will secure it from burning; their superfluous moisture will evaporate, and the potatoes perfectly dry and mealy.

You may afterwards place a napkin, folded to the size of the saucepan's diameter, over the potatoes, to keep them hot and mealy till wanted.

This method of managing potatoes is in every respect equal to steaming them, and they are dressed in half the time.

There is such an infinite variety of sorts and sizes of potatoes that it is impossible to say how long they will take in doing; the best way is to try them with a fork. Moderate sized potatoes will generally be done enough in fifteen or twenty minutes.

The Cook's Oracle, in addition to the preceding, gives the following methods of Dressing Potatoes. Although some of the modes described are familiar to every housewife, it is not probable that some others may be new and more useful to those who wish to make the best of this root, which, as an article of sustenance, is second only to the staff of life.

COLD POTATOES FRIED. Put a bit of clean larding into a frying pan; when it is melted

slice in your potatoes with a little pepper and salt, put them on the fire, keep stirring them; when they are quite hot they are ready.

2. POTATOES BOILED AND BROILED. Dress your potatoes as before directed, and put them on a grid-iron over a very clear and brisk fire; turn them till they are brown all over, and send them up dry, with melted butter in a cup.

3. POTATOES FRIED IN SLICES OR SHAVINGS.—Peel large potatoes, slice them about a quarter of an inch thick, or cut them in shavings round and round as you would peel a lemon; dry them well in a clean cloth, and fry them in lard or dripping. Take care that your fat and frying pan are quite clean; put it on a quick fire, watch it, and as soon as the lard boils, and is still, put in the slices of potatoe, and keep moving them till they are crisp; take them up and lay them to drain on a sieve; send them up with a very little salt spread on them.

4. POTATOES FRIED WHOLE. When nearly boiled enough, put them into a stew pan with a bit of butter, or some nice clean drippings;—shake them about often (for fear of burning them,) till they are brown and crisp; drain them from the fat.

Observation.—It will be an elegant improvement to the three last receipts, previous to frying or broiling the potatoes, to flour them and dip them in yolk of egg, and then roll them in fine sifted bread crumbs; they will then deserve to be called *potatoes full dressed*.

5. POTATOES MASHED. When your potatoes are thoroughly boiled, drain and dry them perfectly, pick out every speck, &c. and rub them through a collender into a clean straw pan; to a pound of potatoes put about half an ounce of butter, and a table spoonful of milk; do not make them too moist; mix them well together. You may put them into shapes, egg them with yolk of egg, and brown them very slightly by a slow fire.

POTATOES MASHED WITH ONIONS. Prepare some boiled onions, by putting them through a sieve, and mix them with potatoes. In proportioning the onions to the potatoes, you will be guided by your wish to have more or less of their flavor.

7. POTATOES ESCALOPED. Mash potatoes as directed in No. 5; then butter some nice clean scallop shells, or patty pans, put in your potatoes, make them smooth at the top, cross a knife over them, strew a few fine bread crumbs on them. Sprinkle them with a paste brush with a few drops of melted butter, and then set them in an oven; when they are browned on the top take them carefully out of the shells, and brown the other side.

8. POTATOES ROASTED. Wash and dry your potatoes, (all of a size,) and put them into a tin Dutch oven [or any other oven] or cheese toaster; take care not to put them too near the fire, or they will get burnt on the outside before they are warmed through. Large potatoes will require two hours to roast them.

N. B. To save time and trouble, some cooks half boil them first.

9. POTATOES ROASTED UNDER MEAT. Half boil large potatoes,—drain the water from them, and put them into an earthen dish, or small

tin pan, under meat that is roasting, and baste them with some of the dripping;—when they are browned on one side, turn them and brown the other,—send them up round the meat, or in a small dish.

10. POTATOE BALLS, [OR MASHED POTATOES ROLLED INTO A SPHERICAL FORM.]—Mix mashed potatoes with the yolk of an egg, roll them into balls, flour them, or egg and bread crumb them, and fry them in clean drippings,—or brown them in a Dutch oven.

11. POTATOE BALLS RAGOUT. This is made by adding to a pound of potatoes a quarter of a pound of grated ham, or some sweet herbs or chopped parsley and onion or shallot, salt, pepper, and a little grated nutmeg, or other spice, with the yolk of a couple of eggs; they are then to be dressed as in the preceding No.

12. POTATOE SNOW. The potatoe must be free from spots, and the whitest you can pick out; put them on in cold water; when they begin to crack, strain the water from them, and put them into a clean stew pan by the side of the fire, till they are quite dry and fall to pieces; run them through a wire sieve or the dish they are to be sent up in, and do not disturb them afterwards.

13. POTATOE PIE. Peel and slice your potatoes very thin into a pie dish; between each layer of potatoes put a little chopped onion, (three quarters of an ounce of onion is sufficient for a pound of potatoes;) between each layer sprinkle a little pepper and salt, put in a little water, and cut about two ounces of butter into little bits, and lay them on the top;—cover it close with puff paste. It will take about an hour and a half to bake it.

N. B. The yolks of four eggs (boiled hard) may be added; and when baked a table spoonful of good mushroom catsup poured in through a funnel.

NEW POTATOES. The best way to clean new potatoes is to rub them with a coarse cloth, or a flannel, or a scrubbing brush. They are, however, poor, watery and insipid till they are about two inches in diameter, or have nearly or quite obtained their full growth.

Correspondence.

SWINE.

To the Editor of the New England Farmer,

SIR,—The swine or hog is a valuable and useful animal and a number of them is almost as necessary for the farmer as a stock of cattle.—Hogs are not only valuable on account of the meat and fat they afford for the market and home consumption but highly useful in the business of making manure.—It is an indisputable fact that by proper care and attention, a greater quantity of good manure can be made from swine than in any other way with the same expense.

Much exertion has been made within a few years to make our hogs better by introducing new kinds and crossing different breeds and in some instances they have been essentially improved but in others wretchedly depreciated.

A kind have lately been introduced into this

vicinity denominated the English breed. I am one among many others who have incautiously ventured to make trial of them to my great disadvantage as they turn out to be inferior in every point to any that I have had before them. I can with the same expense make one of my old sort weigh at least one hundred pounds more than one of the new kind so that upon a moderate calculation there is a loss of not less than five dollars in each hog of the English breed.

Much credit is due to the committee on swine at our last cattle show on account of their decision between the competitors for premiums.—The gentlemen composing this committee are well known to be practical farmers and well qualified to perform the duty assigned them.—Their judgment was decidedly in favor of the larger kind of hogs in preference to those mouse eared chubs which are to be seen in many of our styes more resembling woodchucks than swine.

The credit of this famous kind of hogs is undoubtedly sinking in this vicinity. Several of my neighbors have lately expressed their disapprobation of them and their preference to a larger kind as being better and much more profitable.—I am determined to be rid of them as soon as practicable and for time to come be contented with my old sort until I have better evidence than I had before that a new kind is preferable.*

Swine must have suitable food and enough of it, together with good care and attention in order that they may do well and be profitable. They should always be attended by the same person for if one takes the whole care of them, he will better know what they most need and how much to give them. They should never have any more given them at a time than they will readily eat with a good relish, for if they have more than this it will cause them to become dainty, and lose their appetite, so that frequently they will eat but little more than enough to keep them alive.

The practice of grinding cobs or ears of corn, for hogs, to me, appears to be worse than useless; and were it wholly dispensed with, I think we should see better hogs and hear less complaint about their being dainty and doing so poorly. It is a fact, which I have proved by actual experiment that hogs which have for a considerable time been fed upon good meal, will

* This statement gives a view of the subject very different from that to which we have been accustomed. We have been told by experienced agriculturists that the breed of swine, originally introduced into this country from England, and which had its origin we believe, from the celebrated Bakewell, has proved a great benefit to agriculturists. That very correct and scientific cultivator, Dr. Fiske of Worcester, stated (in a piece originally published in the Worcester Spy, and republished in the New England Farmer, vol. i. page 107,) as follows:—"My hogs are of the genuine Bedford breed so called in England, and experience has proved to my satisfaction that this breed is far the best that has been introduced into this country." They are quiet in their nature, fat easy, and with little expense or trouble. I have had some weigh at 12 months, about 350 lbs., and a considerable number, at 18 months old, 400 lbs."

It is possible, however, that the breed, originally excellent, may have deteriorated for want of crossing. "Breeding in and in" as it is technically called, will, in time ruin any breed. See N. E. Farmer, vol. i. page 370.—Editor N. E. Farmer.

not at any rate eat that which is made of clear cobs, and very unwillingly that which is made from ears of corn.

My method of feeding hogs is to boil potatoes night and morning during the winter and spring, with which I put a small quantity of meal and give it to them which makes them grow and do well. Through the summer I give them the wash of the dairy, and about the first of September put them to fattening, and give them as much meal as they will eat; and in this way I can make as good pork as any of my neighbors.

A FARMER.

Worcester, May, 1824.

CATERPILLARS.

To the Editor of the New England Farmer,

SIR,—As this is the season for the young caterpillar to commence its ravages on our fruit trees, it seems the most proper time to check its career. This may be very easily and at the same time, effectually done by adopting the following plan.

When the sun is within half an hour of setting in a cool evening by the help of portable steps, ten feet in height, the operator (who by the by will have no need of "spirits of turpentine, fish oil, lighted birch bark," &c. &c.) after coming at the nests will have simply to apply (do not shudder gentle reader) his fore finger and thumb, or if more convenient, his whole hand, and in an instant crush their little commonwealth to atoms!

By the above method, with the occasional use of Mr. Pickering's brush, when the nests could not be otherwise approached, I commonly exterminate these foul interlopers before their size exceeds one fourth of an inch in length, and should feel confident of getting rid of them in toto, if my orchards were not in the neighborhood of the sluggish whose orchards are, each succeeding year, swarming with the above vermin, which, while in the moth state, will deposit its eggs as well on my trees as on those they had so recently robbed of that beautiful and necessary clothing, their foliage.

While on this subject, permit me to ask, if the remedy mentioned in a late New England Farmer was meant to apply to the worm, known in this country by the name of caterpillar; or the canker worm? for as the former is already up before it emerges from its cell, I am at a loss to conceive what benefit "a sod of earth" can be, in preventing its future operations. W.

F—g, May 4, 1824.

BY THE EDITOR. We have, repeatedly expressed our opinion that a "sod of earth" will not prove of any use against caterpillars, and do not believe they would prove any more efficacious against canker worms. See New England Farmer, vol. ii. page 262, 290.

PEACH TREES.

To the Editor of the New England Farmer,

SIR.—In looking over your valuable paper from its commencement, I find no account of an insect which has greatly injured my young Peach Trees this season, but I presume it is that pest called the 'borer'. Its depredations are generally committed in the main trunk of the tree, at from 18 inches to 4 feet from the ground. Observing the trees to look sickly I was induced to search for the cause, when I noticed several places, where the gum was oozing

out through very minute orifices in the bark this lead to further investigation, on which, I discovered an unctuous mass of white matter between the inner bark and the wood, which, I presume is the larvæ of the insect; around this deposit the wood and bark had turned of a dark brown color, and were evidently in a state of disease. I am convinced this must be the cause of the failure in the trees, but I am at a loss for a remedy, which is the cause of this communication.—Perhaps you, sir, or some correspondent, may do others, as well as myself, a favor by pointing out a preventive or cure for the evil I would observe, that there are no worms below ground, that having been duly attended to.

Yours, &c.

A SUBSCRIBER.

Lynn, Mass. May 12, 1824.

Our correspondent in "looking over" our paper, may have overlooked some of its articles. In vol. i. p. 10 he will find the shells of walnuts recommended, and pages 187 and 317, of the same volume he will perceive other remedies prescribed for this disorder. Again in vol. ii. pages 241, 281, and 291, he may find mode of extirpating the borer recommended. How far or of them may prove successful we cannot say any thing more than has been said by those from whom we derived our information on the subject. We wish the prescriptions might be faithfully tried, and if any thing farther can be suggested should be happy to publish it.

CIRCULAR.

CITY OF WASHINGTON, 6th May, 1824.

SIR,—The importance of the subject, will trust, authorize the liberty I now take to a dress you;—being impelled by a motive of less force, than a full conviction that I have discovered an improvement in the management of the COTTON PLANT, by which the male called the *rot*, so often destructive to the hope of the Planter, and that hitherto seems to have baffled all attempts to arrest its ravages, may be prevented—the maturation accelerated, and the crop increased;—withal so economical the execution, as to promise general utility. And as it is desirable to inspire confidence in the efficacy of the process by affording *practical inferences* before proceeding to the simple details, I crave your attention to the following remarks, that are intended to elucidate the principles upon which the discovery is founded and exhibit the *rationale* of the effects of its application.

On examining the staple of mature Cotton with a high magnifier, it will appear that the filaments are *tubular*, having lateral *pores* or *cells*, communicating with the longitudinal tube and containing an unctuous substance, which must be extracted or decomposed, before the article can be made to receive a permanent dye,—a due and regular secretion of this unctuous matter, is deemed essential to the health and vigor of the capsule or pod. When those minute vessels in the green and tender filaments become ruptured or greatly distended, morbid state of action ensues, which may be considered as the predisposing cause of the *rot* and a further investigation of the physiology of the Cotton Plant will lead to the conclusion that this cause is induced and the disease excited, by an excess of stimulus or undue absorption of crude aqueous sap—promoted by sudden changes of temperature, copious rain, &c.

pecially after drought or extreme luxuriance.—thus affected, the *proximate* cause may be limited to a peculiar humid state of the atmosphere—to the action of insects or other external agents.

Each species of the Cotton Plant generally cultivated in the United States, and of necessity varied as an annual, may be found in climates are congenial, or where indigenous, a *perennial* plant, capable of production for several years. The Album or Sap-wood, comprising the entire stem, with the exception of a small portion of pith, although the product of our short seasons, has a firm texture, and is replete with a variety of tubes, through which the sap ascends from the remotest fibres of the roots to the leaves; and descends through the bark. In its capacious *vascular system*, owing to the earl stature of the plant and other causes, a powerful capillary attraction is ordinarily exerted; producing a copious and rapid flow of sap, a correspondent increment of wood, and a constant succession of flowers and capsules; a portion of which do not arrive at maturity.—Now if the circulation of sap is stopped in its descent through the bark, it must necessarily be subject to less violent action upon any excess of stimulus, and more perfect elaboration in the bines and foliage, by a protracted exposure to light, heat and other influences of the atmosphere; while the leaves, exercising their proper functions, perspire or evaporate the excrementitious and aqueous parts; the remainder thus modified, or prepared for organization, is absorbed and evolved by the flowers and capsules; rendering them at all times vigorous and able to withstand the vicissitudes of seasons, the action of insects,—and to repel the formidable mastic like that float in the atmosphere, usually to fix upon weak or diseased vegetation, and complete its destruction. Moreover, the plant being, in a great measure, deprived of the means of propagating the *oviparous* or *wood* progeny, its energies are directed to the *oviparous* or *sexual*; accordingly, the main force of vegetation is employed to increase and perfect the crop.

You will now understand, Sir, that the improvement before stated, consists in obstructing the circulation of the sap in its descent through the stem or branches of the Cotton Plant, without deteriorating the Album or Sap-wood—this may be effected by an annular excision of the *cortex* or *liber*, or outer and inner barks. And the process on which I rely for the most efficient and economical application of the discovery, is with an instrument I denominate a Decorticator, that will, at a single operation, decorticate a cylinder or annular strip of the bark, and completely detach the same, leaving the Album entirely bare; and can be managed with such facility, that a common labourer, if believed, will be able to operate upon one acre more acres in a day. This instrument has some resemblance to the common *forceps*, in the form of which are two knives of an elliptical form, for making the *horizontal* incisions, parallel, and at such distance as the width of the excision may require; between each in the centre, is fixed an *incisor*, for making the *vertical* cuts, having its edge at right angles, even with the edges of the horizontal knives. The operator grasps the stem with the instru-

ment, and by a gentle pressure, which a spring between the handles enables him to regulate, the strip to be removed, is divided on each side, when by turning the instrument round the stem, the horizontal incisions are completed, and by the same operation the incisions detach the bark. To prevent an accumulation of bark between the knives, that would obstruct their operation, or consume time in removing, *springs* are fixed at each end on a level with their edges, and extending to the incisor, where they give way on a slight pressure; when that ceases, they return to their former position and throw off the bark. For a more particular description of this instrument, you are referred to the *American Farmer*, in which, by the patriotic and friendly exertions of John S. Skinner, Esq. of Baltimore, the indefatigable Editor of that invaluable vehicle, a *fac simile*, or drawing of full size, with ample references for its construction, will shortly appear.*

It will readily occur to you that the results of single experiments in Agriculture, often prove no more than what relates to a *single season*, to *one soil*, *one climate*, and *one mode of culture*; and the axiom may be applied to the present subject, which opens a field where great uncertainty of data must necessarily exist. It is from this consideration, Sir, that I am induced to solicit that the merits of the discovery may be submitted to the test of varied and multiplied trials, under your auspices, the approaching season; and with great deference offer some suggestions as an outline for your government.

The first and most important point to be ascertained, is the period most suitable to obstruct the sap, in order to promote the highest state of improvement in the crop, and at the same time effectually guard against the *rot*.—For this purpose a number of rows in a cotton field should be appropriated expressly for experiments;—commencing with one row when the flower buds appear on the first tier of branches—with the next when the petals of the flowers on those branches are first expanded; continuing to decorticate other rows successively at every marked *stage of growth*, 'till the crop approaches to maturity—leaving *untouched*, alternate plants in each row, as *standards* for comparison. There may possibly be periods when the bark will not peel freely; in that case the operation should be deferred 'till it can be easily and completely detached, so that no fibre be left to connect the circulation; nor should there be any shoots or branches permitted to remain between the roots and the excision, unless they are also decorticated.

Should you be disposed to extend the operation to *acres* or *fields*, the period I shall assume as most likely to produce the desired results is, when the plants are in full foliage, having the most part of the flower buds formed, that may be expected to come to maturity, and before the fecundating process has generally commenced; as the organs of fructification will be greatly invigorated, and, of course, fewer abortive pods.

The necessary width of the excision of bark, presents for the next enquiry; and on this point so much depends upon the luxuriance of the plant and the period when decorticated,

that experience only can determine. It will be inexpedient to expose more of the Album than necessary; and probably one-fourth of an inch may be assumed as the medium, to prevent a union of the barks and a restoration of the circulation, before all the benefits from the process are realized.

I would further request, that your attention may be directed to plantations where no danger is apprehended from the *rot*, particularly to the *black seed* species, which, though not affected by that malady, except in peculiar situations or in consequence of long continuance of wet weather, is subject to a *rust* that destroys the foliage, causing the pods to shrink or perish; and also to a *blight* that shews itself in dark spots on the capsules; these, by whatever more correct names they may be distinguished, are both active members of the *parasitic* family—the effect of a diseased state of the vessels and not the cause. And probably may be repelled by the increased vigor imparted by decortication.

It should be kept in view that the black species is more disposed to produce *wood* than the green, especially on deep carbonaceous soils, such as *swamps* and *marshes*; indeed so much so, as to become very unproductive from its exuberance and profusion of *wood buds*. There are strong reasons for concluding, that this disposition may be changed, and flower buds produced more abundantly, if the plants were decorticated at an early period, or as soon as there was sufficient *stamina* in the stalk to bear the operation. The prospect of an accelerated maturation, will, I trust, elicit attention to decorticate this species, even on the sea islands.

As you may be unprovided with the instrument above described before the season for operating commences, one of the following description I presume may be conveniently within your reach. Insert into a *haft* the blades of two knives a quarter of an inch apart, or the width that may be deemed necessary, having their edges parallel and even. With such an instrument two horizontal incisions are made at the same time; when the operator should divide the strip by one or two vertical cuts, and children might follow and detach the bark with their fingers. Although this method will require more than double the labour, and, without great care, less likely to be well performed than with a decorticator properly constructed, yet it is believed that considerable progress may be made in a day.

It remains to be stated that LETTERS PATENT have this day been issued according to law, granting me the exclusive right to the improvement here announced. And I hereby give you a license to make use of said improvement to any extent that may suit your pleasure or convenience, for and during the present season. At the close of which, namely, after the first day of November next, I shall be ready to relieve overtures and to treat for the disposal of the right of said improvement, either for the State in which you reside, for Districts, or to individuals.

With sentiments of high respect
and consideration, I am, Sir,
Most faithfully yours,
SAMUEL WYLLYS POMEROY.
Of Brighton, Massachusetts.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.
No. V.

The celebrated English statesman and orator, Mr. Windham, asserted in the House of Commons, that 'Cobbett deserved a Statue for what he had done in the United States.' He referred to his first visit, in 1793, when he came to try his fortune among us, to his great exertions, to promote the cause of England, and to his abuse of the French nation, and of some of the greatest and best men in this country. Instead of erecting a statue, to him, he was put in Newgate in 1810, for two years, and fined one thousand pounds to the King, merely for publishing 'that British soldiers had been whipped in the heart of England, under a guard of German bayonets.' His zeal in the bonnet business certainly entitles him much more to a statue from his countrymen, than his political conduct, either in England or the United States; and he cannot fail of being remembered honorably, for the source of wealth which he has laid open for his countrymen. He says, (June, 1823) "I know they (the English bonnets) will go to America. I know they will beat the Leghorns in the West Indies, in South America, and in the United States; but the thing of all things I should like, is to send a box of hats and sell them at Leghorn! In his Register of December 19, 1823, he says that the people of Norfolk and Suffolk have taken the lead in the valuable manufacture, and the town of Bury St. Edmunds is sending out teachers to instruct the rest of the country." He is safe in saying that the English will beat the Americans, because it is probable that Congress will not follow the example of England, by encouraging the manufacture of the article in these states. They will do what the writers of England wish and say they ought to do, that is, lay no duties, let trade "regulate itself."

Thus the trade will be completely turned upon us. We first sent New England bonnets to old England; and she will hereafter deluge us with them; and together with the capital with which we in effect supply the British manufacturers, to the great injury of our native importers, by allowing long credits on importations; and by the disposal of their *filmy made-for-auction-goods*, at public sale on their account, will contribute to the drain of our cash from us, and continue the chain, which the British statesmen boast, they have entwined around the necks of the Americans.

Our fellow citizens of the south, are in particular, interested in patronizing the cheap American straw and grass bonnet manufactory, to enable the people of the north to purchase their grand staples.

Tobacco, will not now pay for cultivation, and there is no prospect of any change taking place in the price for the better: for accounts which may be relied on, state, that at the close of the year 1823, the stock in Europe amounted to 75,000 hhd.—that is 10,000 beyond the demand for one year. Nor can more be said for Cotton. The planters of South Carolina and Georgia, ought to reflect upon the fact, that twelve years since when their export of cotton did not amount to more than half, (if so much,) as that during the last year, their receipts were

far greater than at present. Friend Cropper of Liverpool, did indeed, by a most fallacious statement, last year, induce the planters to believe, that the supply would not be equal to the demand, and for a few months, the effect was, his receiving large consignments, the thing he wanted, but the bubble soon burst, and now it seems, that new rivals in the cultivation of cotton have started up, in the independent colonies of South America, and of Mexico. Several cargoes of the article from Santa Martha, and of Carthagena, have been imported into Philadelphia, and sold at 17 cents: it was eagerly purchased by the spinners, being soft and silky, and the staple as long and fine as that of the best Sea Island. The Spanish colonies, are our rivals at home: a more distant, but no less formidable competitor in the European market is that extraordinary person the Pacha of Egypt, samples of whose good cotton have been received in the United States, and who, having the power will doubtless accomplish that which he has declared he would do, "cover the earth with the cotton plant from Cairo to the Cataracts of the Nile." His first shipment of several thousand bales was a short time since stated by a Manchester Commission house, to their correspondent in Philadelphia, to be on the way to England. The people of New England, take the cotton from the south, and they would take a great deal more, if Congress would increase the duty upon fine cotton fabrics, and upon coarse woollens; and justice demands that the ladies and men of the south should wear the fine grass and straw bonnets of the north. What a glorious sight would it be for 1000 ladies of South Carolina to appear during their annual carnival in Charleston, and especially on the race course, covered with them!!! That would be truly an act of patriotism. It would be proper conduct in the daughters and grand daughters of women, whose high eulogy will be pronounced by future historians, and who during the American war, so nobly submitted to the greatest privations, to bodily and mental sufferings, for the glorious cause of their country, and often supported the drooping spirits of their husbands, lovers, and sons, in the trying scenes to which they were exposed; and who while prisoners in Charleston, refused to dance at balls with the elegantly dressed British officers, and accepted as partners, their captive countrymen with thread bare coats!

Besides, is it not better policy to make this reciprocal exchange of a raw material for an elegant article of dress, than to send their money to Leghorn for hats? Cotton, the Leghorners do not want, for they raise what they require, in their own country. But the cry is, that "the manufacturers will impose, and charge two prices if encouraged by increased duties on foreign goods. Such fears are groundless. The fact of the high prices they charged during the late war will not happen again; and even for those prices an apology may be offered, by referring to the well known fact, that farmers, planters and merchants always avail themselves of a scarcity in the article they have to sell, by taking as much as they can get. The cotton planters themselves did not refuse at one time 50 cents a pound for Sea Island cotton, and 30 cents a pound for Upland: they would gladly get those sums again, but *the game is up*: nor did the Tobacco planters refuse in the year

1818, \$110 and \$120 per hhd. for their tobacco: they would take those sums to-morrow. Such is human nature. High prices for cloths or other domestic articles of manufacture are not again to be expected, although protected by duty; for the *invariable result will be*, as long since stated by A. Hamilton, that competition will reduce prices even below those of the imported article; and at the same time, the American fabric will be far better in quality than the foreign. Coarse muslins, bats, leather, chemical medicines, paints, and many other articles that might be mentioned, are in proof of both positions. The abundance of Capital, the diminished sources for investing it, and the zeal of our citizens, are a powerful stimulus, to active engagements in manufactures; and if the example of the statesmen of the old world was adopted by those of the United States of *protecting in every possible way, home industry*, the world soon flourish, and prosperity once more be restored to the country.

A Friend to Agriculture, Commerce and Manufacture

Extracts from the London Farmers' Journal.

ON SALT AS A MANURE.

Cheshire, Feb. 25, 1824.

"In answer to the enquiry of a Yorkshire Farmer, (inserted in your valuable journal for the present week,) respecting "Salt as a Top-dressing for Wheat," I beg leave to say, that should consider salt, used as a top-dressing, even in a moderate quantity would be fatal to the crop; but if salt had been spread upon the fallows early in autumn, and well incorporated in the soil, there is not a doubt but that considerable benefit would have been derived from particularly so if the fallows were in a foul or weedy state, and which owing to the wetness the last summer was generally the case.

"A CHESHIRE FARMER."

SALT NOT A MANURE.

"I am fearful that the humbug that has gone forth to the agricultural world, 'that salt is a powerful manure,' will have occasioned much dependence and consequently great disappointment, among those whose education has not been such as to enable them to fairly investigate the merits of this subject. Animal and vegetable life is supported by that quantity of food, which is taken up by the absorbent vessels (for I call the fibrous roots of plants by that term;) and the food of each is considered more or less nutritious, in proportion to its solubility.

"Salt operates on the animal system, by promoting a more copious discharge of saliva and gastric juice, (the natural solvents of food and which it aids in promoting an increase quantity of chyle, thus inducing a tendency to fatten; acting not as a food in itself, but as condiment.

"So in using salt as a manure—it is not in itself a manure, but assists, used in moderate quantities, the decomposition of the decaying animal and vegetable matter applied as a compost, aiding them, more quickly to assume the æriform, or liquid state, which is necessary previous to absorption by the plants, for the vigorous and healthy growth."

REMARK.—Our readers will perceive similar idea to the above in our paper, vol. ii. pages 210, 249.

FEEDING CATTLE WITH FLAX SEED.

"A correspondent in the Farmers' Journal recommends feeding cattle with flax seed, and says, 'the mode which I have adopted was to mix the seed down to a jelly, adding thereto a small quantity of salt, and sufficient pollard and chaff to make the food tolerably solid. I began by giving the seed in the proportion of 1 lb. to each beast daily, and gradually increased the quantity to 4 lbs. The cattle were exceedingly fond of it, and threw well.'"

REMARK.—The foregoing corroborates the assertions of some of our American cultivators, who have found flax seed jelly an excellent ingredient in feed for fattening cattle. See N. E. Farmer, vol. i. ps. 13, 314.

From the American Farmer.

MAPLE TREE SUGAR.

Washington, Pa. April 20, 1824.

DEAR SIR,—The honour done my hotch potch distle of the 6th of March, by publishing it, is quite unexpected.* It was really intended only for your own eye; and contained as many notions as a yankee pedlar's cart. I am, however, gratified to find you view the sugar tree in the manner it truly merits. It is one of "heaven's choicest gifts," bestowed on our happy country; but like many other blessings, shamefully abused. The farmers near this place sell nearly as much sugar tree, as hickory for fuel. It is equally valuable for this purpose.

I know many families that make from twelve to sixteen hundred pounds of sugar annually, and some go over two thousand pounds. The force required is one man, one boy with a horse and small sled, to collect the water; with occasionally a little extra help. In many instances the females of the family do all the work, except cutting and hauling the wood for fuel. A settlement in the northern part of Ohio, called the "western reserve," has justly obtained much celebrity for making large quantities of sugar. It is almost entirely settled by New Englanders, a people that know how to make the best of every thing. A friend, at my request, has written to his brother, who lives in that settlement, for correct information on this subject; which if obtained shall be forwarded to you. I question much, however, whether any tree in the United States can exceed one that grows on the farm of Amos Walton, of West Bethlam Township, this county. The produce of this tree for the last three years was as follows: spring of 1822, thirty-five and one half pounds; spring of 1823, twenty four pounds; and this spring twenty-nine and a half pounds; with a small portion of molasses each year. I had the above statement from a member of the family. I am well acquainted with them, and know them to be very respectable. The tree is not of the largest kind, but has a very bushy top. It stands near the head of a spring, without any other trees near it. The quantity made in this county this season falls short about one fourth. The quality very good.

I wish you to send me No. 46, of the 5th vol. of the Farmer, containing Mr. Bates' admirable address. So many of my neighbours borrowed and read this address, that they have literally read it to rags. I am, your's, &c.

ALEXANDER REED.

Republished in the New England Farmer, vol. ii. p. 298.

From the Columbian Centinel.

MR. RUSSELL.—Presuming on your love of country, and of good Butter I wish you would give place to the following remarks relating to that article; and if every Editor in New-England would do the same, they would benefit themselves as well as their neighbors. Your obedient servant, D.

TO THE BUTTER MAKERS IN NEW-ENGLAND.

The writer of this note could tell a long story about Butter, having been 45 years in the trade, but he will make it very short.

Make your Butter of sweet cream—work out all the buttermilk; put no more salt to it than will make it palatable, for salt has no good effect as to keeping Butter sweet; it is working out all the Buttermilk, and excluding the air from it that will accomplish this very desirable object.

Pack your Butter in handsome, tight kegs, which will contain 20 or 25 lbs.; soak the kegs well in a strong pickle, and then tare them; pack the Butter solid—not in layers as is too often the case. This method of packing Butter gives you a double chance for sale; for being equally handy for home use, if it does not sell in the market, it can be inspected, and will be in order for exportation. But when your Butter comes to market in tubs, barrels, boxes, &c. it can be sold only for home use, for Butter cannot be exported except in kegs.

Many tons of Butter are now on hand made last year, and the year before, the greater part of which must be sold for soap grease, at 5 cents per pound.

This article, if made good, and well packed, would constitute a very considerable commodity for exportation, but foreigners will not eat our rancid Butter. The Spring and Summer Butter must be sold low, for our merchants cannot ship Butter at a high price; for the Dutch and Irish Butter stand in our way, and is very excellent.

The custom of selling Butter in lumps to the traders is a very bad one; every family should first fill a keg, no matter if it does not contain more than twelve pounds, then sell it to the trader; but the other method is ruinous.

I hope some gentleman of education and knowledge of the subject will take it up, for it is very necessary to the welfare of

NEW-ENGLAND.

Grass Bonnets.—"The liberal price," says the Baltimore American, "which was paid about a year ago at the Exchange, by a merchant of this city, for a beautiful grass bonnet, manufactured entirely of domestic materials by a lady of Tioga County, in the state of N. York, we learn has had the happy effect of directing the attention and ingenuity of others in that section of the country to the same branch of domestic manufacture. We are informed that numbers of females and children, are now employed in fabricating grass bonnets, and hats, in imitation of the various qualities of Leghorn, and that the manufacture has been attended with much success. We learn that Judge Drake, of Tioga, arrived in this city a few days ago, by way of the Susquehanna river, bringing with him a bonnet of the most admirable colour, texture and workmanship, made by

the same fair hands which produced the bonnet first alluded to. A gentleman who has examined and compared it with high priced Leghorn, describes it as far surpassing that or any other he has ever seen."

Cotton Sails.—The editor of the Darien Gazette states that he has been favored with a sample of cotton sail cloth, or canvas, which for beauty and strength exceeds any thing of the kind he has ever beheld; and strongly recommends to ship owners to give it a fair trial, observing that one suit of cotton sails will out last two of Russia or any other canvas that is now in use. The editor of the Gazette further states that he has sailed on board Portuguese, Spanish, Maltese, Sicilian and Greek vessels—none of which had any other but cotton sails, and generally, all their small rigging was cotton.

The schr. Atlantic, bound to Philadelphia, sailed from Darien on the last of April, fitted with a suit of cotton sails.

NEW ENGLAND FARMER.

SATURDAY, MAY 22, 1824.

FARMER'S CALENDER.

MAKING CHEESE.—Although we have heretofore given pretty copious directions on the subject of making butter, we have had little to say relative to cheese-making. But the manufacture of cheese is scarcely less important, and we believe is generally more profitable than that of butter. We shall therefore give some remarks respecting this branch of rural economy, premising, however, that what we shall state is derived from reading or conversation, having had no practical acquaintance with this sort of domestic manufacture. We shall not pretend to dictate, nor even to advise, but hope to furnish some hints, of which those who have the management of dairies may perhaps avail themselves to advantage.

The goodness of cheese, as well as of butter depends much on the quality of the milk; though the season and particular process adopted in making it, also have a very considerable influence upon it in this respect—more perhaps than the material of which it is prepared. We shall, therefore, briefly notice these circumstances; and, as different modes of making cheese are practised in different counties, or places, we shall then concisely state those which are more particularly deserving of notice.

The best season for this purpose is from the commencement of May till the close of September; or under favorable circumstances to the beginning of October; or during the period when cows are, or in general can be pastured.—In many large dairies indeed cheese may be made throughout the year, provided the cows be well fed, particularly in the winter.

With regard to the rennet, as no good cheese can be made without it, great attention is necessary in preparing it for coagulating the milk. Strictly speaking rennet is coagulated [curdled] lacteous [milky] matter, or substance found in the stomachs or maws of calves that have been fed only with milk, and which was formerly used in coagulating milk; though it is, in a more extensive sense, applied to *bair*, *vell*, *maw*, or *stomach*, as it is variously termed, which pos-

esses the same properties; and which is now invariably used for that purpose.

Dairy women usually preserve the maw, and the curd contained in it, after setting them, and then by steeping this bag and curd, make a rennet to turn their milk for making cheese. But a more simple method, and which is equally good in every respect, is to throw away the curd, and, after steeping it in pickle, stretch out the maw upon a slender bow inserted into it, which will soon be very dry, and keep well for a long time. Take an inch or two of the maw thus dried, and steep it over night in a few spoonfuls of warm water, which water serves full as well as if the curd had been preserved for turning the milk. It is said that one inch will serve for the milk of five cows.

In the Bath papers, Mr. Hazard gives the following receipt for making rennet: "When the raw skin is well prepared and fit for the purpose, three pints of soft water, clean and sweet, should be mixed with salt, wherein should be put sweet briar, rose leaves and flowers, cinnamon, mace, cloves, and almost every sort of spice; and if these are put into two quarts of water, they must boil gently, till the liquor is reduced to three pints, and care should be taken that this liquor is not smoked. It should be strained clear from the spices, &c. and when found to be not warmer than milk from the cow, it should be poured upon the cawl or maw; a lemon might be sliced into it, when it may remain a day or two; after which it should be strained again, and put into a bottle, where it will keep good for twelve months. It will smell like a perfume; and a small quantity of it will turn the milk, and give the cheese a pleasing flavor. He adds "If the maw be salted and dried for a week or two near the fire, it will do for the purpose again almost as well as before."

Another receipt is as follows: "after the maw has been well cleansed and salted, and dried upon sticks or splints, take boiled water two quarts, made into a brine that will bear an egg. Let it be blood warm, and put in the maw either cut or whole; let it steep twenty-four hours, and it will be fit for use. About a teaspoon full will turn the milk of ten cows. It should be kept in glass bottles well corked."

The Massachusetts Agricultural Repository gives still another recipe for making rennet, which is as follows: "The rennet is prepared by taking some whey and salting it till it will bear an egg; it is then suffered to stand over night, and in the morning it is skimmed and raked off clear; to this is added an equal quantity of water brine strong as the whey, and into this mixture, some sweet briar, thyme or some other sweet herbs, also a little black pepper and salt petre; the herbs are kept in the brine three or four days, after which it is decanted clear from them. Into six quarts of this liquor four large calves' bags, or more properly called calves' stomachs are put. No part of the preparation is heated, and frequently the calves' bags are only steeped in cold salt and water.

But whatever kind of rennet the dairy woman may choose to prepare, it should be remembered that this animal acid is extremely apt to become rancid and putrescent, and that great care is necessary to apply a sufficient quantity of salt to preserve it in its best state. The rank and disagreeable taste too frequently

found in cheese is frequently caused by the rennet's having been badly preserved.

It has been observed by Dr. Anderson that it is generally supposed that the goodness of cheese depends almost entirely upon its richness: by which is meant the proportion of oily matter, whether natural or adventitious, that it contains; nothing, however, he says is more certain, than that this does not depend upon this circumstance. *Parmesan* cheese is, he observes, in general, deemed, in respect to *superior*, among the best kind of cheeses that are made; but it contains no remarkable proportion of oily matter. To many palates the small round Dutch cheeses are very pleasing to the taste; yet they are, he asserts, made entirely of skimmed milk. And if softness to the feel, and that kind of consistency which appears mellowed and butyaceous, be the rule for ascertaining the richness of cheese, neither will this be found to depend necessarily on the proportion of oily matter that they contain. "I have seen cheese, made of skimmed milk, that are exactly like the finest kind of cream cheese, which approaches to the taste and consistency of butter; I have seen cheeses made entirely of cream, which had much less of the buttery taste and appearance than the other. In short much more depends on the skill and dexterity of the operator than on the quality of the materials. Many cheeses are made in England of as rich milk as the Siltion cheeses, which seem not to contain nearly the same proportion of cream; and I had lately occasion to notice, that a great many cheeses are made of the same kind of milk with the Suffolk cheese, which have nothing of that horny hardness, and indigestible quality for which these are remarkable. If the taste and consistence that the cheese acquires, when acted on by heat in the process of toasting, be assumed as a criterion for judging of its richness, neither will it be found that this depends upon the proportion of cream that enters into their composition. I have seen very indifferent cheese, that has been made of skimmed milk, which, when toasted, was richer and more pleasing to the palate of most persons, who have tasted it, than very excellent North Wiltshire cheese, which is deemed among the best kinds that are made in this island. From these facts and many other considerations, I am satisfied, that what we call richness in cheese depends more on the particular process adopted in the management, than upon the materials of which the cheese consists. The taste of Gloucester, and that of Cheshire cheeses are very different from each other, though the quality of the milk of which they are made varies very little. The same thing may be said of Siltion and *Parmesan* cheeses, though the vanity of man, desirous to conceal his own weakness is ever disposed to attribute these peculiarities to soil or pasture, or other circumstances that seem to throw the blame of want of success from off his own shoulders.

(To be continued.)

DESTROY INSECTS WHICH INFEST YOUR FRUIT TREES.—The communication of our correspondent "W." relative to destroying caterpillars by manual application we think very judicious. There is another method recommended by Mr. George Webster, of Albany, by which it is said caterpillars and canker worms may be destroy-

ed or driven from the trees they infest. This mode was published in our first volume, page 379, but we will repeat the substance of the recipe. Bore a hole into the tree, put in a little sulphur, and drive in a plug. We know sulphur is peculiarly penetrating and powerful and perhaps, applied in this way may be efficacious. It may be applied to an elm, wild cherry tree, or any other forest tree infested with insects, for the sake of experiment. We wish very much that Mr. Somebody, or Anybody, would try it, and let us know the result. It is not impossible but that by this operation the borer, and other insects which make their lodgments in the wood of the apple tree, pear tree, locust tree, &c. may be driven from their habitations.

LAMP TEA KETTLE. The Editor of the New England Farmer has invented and applied to us what he conceives to be an improvement on any method heretofore made use of for heating or boiling water by a lamp, cooking by steam, frying, &c. by means of heat derived from a lamp.

The lamp is a tin vessel, shaped like a common fire pottinger, which will contain about a pint. To this cover is adapted, perforated with tubes to receive the wicks. The tubes may be of any convenient size, but those which the inventor prefers, after repeated experiment, are about three eighths of an inch in diameter and project about an inch above the top or cover of the vessel containing the oil. About one eighth of an inch below the top, or upper extremity of the tube and seven eighths of an inch above the cover of the vessel, is placed, horizontally, a circular plate of tin of nearly the same diameter with the bottom of the vessel which contains the water to be heated. This plate (according to the last improvement) is perforated with small holes, like a grater to admit air to the burners, while most of the heat is confined to the bottom and sides of the boiler.

The tea kettle is set, and may be soldered in a can of tin, which extends round it, but does not embrace so closely as to prevent the heat of the lamp from pervading the sides as well as the bottom of the boiler. The lower end of the rim or case extends about two inches below the bottom of the kettle. One inch of the lowest part may as well be perforated with small holes like a lantern, but this is not indispensable. A small opening or slit, in the lower part of the case is very convenient, through which the tubes of the lamps, as the blaze may be inspected, to see that they do not smoke the bottom of the kettle, which should be prevented. This aperture may, or may not be closed with a glass. It closed with glass, some of the heat is saved. The wicks are elevated or depressed by a wire for that purpose about the size and length of a common knitting needle, the end of which is introduced into longitudinal slits or apertures in the tubes, between the top of the oil vessel, and the plate of tin before mentioned. The case is set on legs of tin, or other metal, of sufficient length to bring the bottom of the boiler about two and an half inches from the top of the tube of the lamp.

The tea kettles are more broad and shallow than usual; those which we have made being from 8 to 10 inches horizontal diameter, and two to four inches in depth. The nose of the tea-kettle is placed in the top part, so as not to prevent the vessel from being conveniently set into the case before mentioned.

Before the lamp is put under the boiler it should be lighted with a match, or slip of paper, and trimmed in

ch a manner as to yield no perceptible smoke. They are effected by elevating or depressing the wicks in the wire before mentioned. After the lamp is put under the kettle the wicks may still be altered if they would smoke or give but a feeble flame. If the lamp is permitted to reach the bottom of the boiler it will have a black mark or impression, and soon cover and crust the tin with an integument of soot or lamp black which will impede the transmission of heat to the water, and retard its boiling.

The wicks which I generally make use of are from 6 to 8 inches in length. They may be of cotton, or of proper material, and of such a size as completely fill the tubes and at the same time slide up and down without difficulty. If they are crowded too tightly into the tubes, the capillary attraction will scarcely operate, and the lamp will burn at best but feebly. If on the other hand they are too small for the tubes, they will be apt to fall out, and in other respects will not operate favorably. The number of wicks, and tubes may be in proportion to the quantity of water, which it is wished to boil, and the speed with which it is desired to effect the ebullition. I have used from five to thirteen wicks. The wicks, of three eighths of an inch diameter, properly trimmed, and employed, will boil 2 quarts in about 4 minutes. Thirteen wicks will boil a gallon in about 15 minutes. Nine wicks will boil 3 quarts in about 40 minutes. The experiments by which these facts were ascertained were, however, conducted with new kettles or boilers, in which the tin, being new and bright, conducted more caloric and imbibed or transmitted less of the same vessels would do after they had been used and become in a degree blackened or tarnished. If the sides and bottoms of the boilers were varnished or painted black, they would, when new, boil some minutes sooner. A little use, however, obviates any objection from the brightness, and consequent reflection of the tin. After the water is raised to a boiling heat, the wicks but one or two may be extinguished, by pushing them down in the tubes, and the remaining wicks will keep the water simmering at a boiling heat. It is well known to the inventor that the boiling of water by lamps has long been a process by no means uncommon. But the apparatus hitherto used was expensive, and scarcely effectual for boiling much as two quarts of water at a time, when common fish oil has been used. Argand lamps may be used, but cost too much for common domestic purposes. Altho, if burnt in a lamp of sufficient power to raise over three quarts of water from its common temperature to a boiling heat in any reasonable time, will melt and sometimes the whole mass of combustible liquid will take fire at once, and burn with something like explosion.

Its invention does not rest in theory, but has been rendered successful operation. Several gentlemen in Boston have made use of lamps and tea kettles constructed according to the principles described above, and are well satisfied of their utility, and the great economy of boiling water for tea, &c. especially in the warmer months of the season, by this contrivance. A tea kettle, or boiler of this kind has been in use 8 or 10 weeks at the shop for the sale of Soda-water, Nos. 1 and 2 Pemberton Hill, Boston, where it is still employed. Mr. Newton, who keeps that establishment, has ascertained that one quart of oil, which costs about 1-2 cents, will be sufficient to keep two quarts of water at a boiling temperature for six days, from 9 o'clock, A. M. to 11 P. M. Implements of this kind, may likewise be seen and their uses further explained at the office of the New England Farmer, or at No. 20,

Merchants' Row, Boston, at either of which places orders for constructing them will meet a prompt attention.

The Editor hereby gives notice that a Patent for his invention will soon be solicited, and cautions all those who do not wish to render themselves liable to the penalties of the Patent Law of the United States not to make, use, or vend any implement of the same or similar nature with the above described without his licence. He has delayed petitioning for his Patent merely for the purpose of making some further applications of the principle of his invention, which he wishes to describe in his specification.

Mr. Pomeroy's Invention.—We have this day, pages 338, 339, published a circular letter from Mr. Pomeroy, late Vice President of the Massachusetts Agricultural Society, relating to an improvement which he has discovered in the management of the Cotton Plant, by which the malady called the *rot*, so often destructive to the hopes of the Planter, may be prevented. The object of this discovery is of immense importance to that section of the Union, which admits of the culture of the Cotton Plant; and should Mr. Pomeroy's remedy succeed, according to his anticipations, he must rank high among the most distinguished of his country's benefactors.

Mr. Pomeroy has long been advantageously known to his countrymen as a scientific agriculturist.—His Essays on the culture of Indian Corn and Flax Husbandry have been extensively circulated, and met with the entire approbation of those who are the best qualified judges of the subjects of those Essays.—His high standing as an experienced and philosophical Cultivator, will give weight to his opinions, and facilitate the general introduction of his improvements. We wish his success may be as splendid as his objects are praiseworthy and patriotic.

No Political or Religious Controversy in our Columns.—When we commenced our paper, we stated, in substance, that it should not be a vehicle of dispute on any subject of political or polemical nature.—We have however, inadvertently, published, volume II, page 336, 2d column, a paragraph on the subject of converting Jews, Chiorese, &c. which may appear to contravene this prescribed rule of our conduct. But we do not mean to add our sanction to all the sentiments of our correspondents, and due consideration might have led us to reject that part of an article on "Straw Bonnets," which embraced the subject of Missions, &c.

New England Museum.—We do not know a place in this city, in which a stranger can more rationally and agreeably spend a leisure hour than in the *New England Museum*, at the corner of Court and Market streets; which ought to be a favorite resort for all who have any taste for the most rare productions of Nature, and the most curious specimens of Art.

Steam Boat Explosion.—A very disastrous explosion took place on board the steam boat *Etna*, Capt. Robinson on the 15th inst. on her passage from Washington, New Jersey, to New York. The deck of the boat was blown off and the vessel rendered a complete wreck.—There were about forty passengers on board. Three women and two men lay dead on board, some jumped overboard of whom three were drowned and fifteen or twenty severely scalded.

Fire at Harper's Ferry.—A fire took place at Harper's Ferry on the morning, before day break, of the 8th inst. by which a large Yarn Manufactory, belonging to the United States, about 150 feet long and 50 feet wide was destroyed. Loss to the United States from 80 to 100,000 dollars, and to the workmen in

consequence of being thrown out of work from ten to twenty thousand dollars.

CONGRESSIONAL.

IN SENATE.—Friday, May 7. The Senate resumed the consideration of the Tariff Bill, and on motion of Mr. King, of New York, decided that worsted stuff goods should be subjected to a duty of twenty-five per cent. only.—Vas 27, Nays 23.

On motion of Mr. Haynes, the Senate voted that blankets should be subjected to a duty of twenty-five per cent. only. Flying pans were exempted from the proposed duty, 29 to 18 cts. The duty on Cocoa was stricken out, and likewise the duty on Russia, Hollands and Ravens Duck, Osanburg's, Tickenburgs and Burlaps was fixed at fifteen per cent. ad valorem.—Vas 34, Nays 16. Woolen goods, the value of which does not exceed 37 1-3 cents per yard, were subjected to no more than a duty of 25 per cent. The duty of four cents per pound on Tallow was stricken out without a division, and the draw back on that article expunged. A duty of ten cents on Oats was added to the bill. The duty of three cents per pound on Flax was stricken out. A specific duty on Prunella Shoes, Laced Boots, &c. was agreed to. The duty on Pepper and Glass Bads was stricken out; but the Senate refused to strike out the duty of 6 cents per bushel, heaped measure, on Coal.

Saturday, May 8. The duty on Chinese Cassia was stricken out; and a duty of two cents per pound imposed on Ginger. The duty on cutting knives, scythes, spades, &c. was so modified as to make it 30 per cent. ad valorem. The duties on screws and vessels of cast iron were reduced to 30 per cent. ad valorem.

Monday, May 10. A communication, and documents, relating to the Commercial Relations between the United States and Portugal were received from the President, and on motion of Mr. Lloyd, of Mass. ordered to be printed.

The Tariff Bill was again discussed, but it is not possible to give a record of the proceedings in our limits.

Tuesday, May 11, and Wednesday, May 12, were devoted almost altogether to the Tariff Bill.

Thursday, May 13. The Tariff Bill, as amended in the House, was read a third time, and passed.

House.—Friday, May 7. The engrossed bill to authorize the creation of five millions of dollars of stock to meet awards of Commissioners under the Florida treaty of 1810, was passed, and sent to the Senate for concurrence.

Saturday, May 8. A bill relative to police regulations for the Capitol, and a bill relative to clearing the Ohio and Mississippi of obstructions to navigation were discussed, but no decision obtained.

Monday, May 10. The long agitated Beaumarchais claim was discussed, and after long debate laid on the table.

Mr. Stewart proposed to bring forward on Thursday next, a resolution for appropriating the annual proceeds of the sales of public lands, and the dividends of the United States' Bank Stock, commencing from the 1st of January, 1823, to the purpose of internal improvements, to be distributed among the states according to their representation, &c.

Tuesday, May 11. Mr. Strong, of N. Y. offered a resolution for appropriating the proceeds of public lands after the 4th of July, 1825, to the support of common schools, and the constructing of public roads and canals.

Wednesday, May 12. A bill respecting a canal in Indiana was debated on, reported, and at length ordered to be engrossed.

A bill for appropriating \$20,000 for repairing Plymouth Beach passed the first stage.

Thursday, May 13. An account of the receipts and expenditures of the United States for 1822, with an appendix on the state of the Public Debt at the close of that year was transmitted by the Secretary of the Treasury and laid on the table.

The Tariff with amendments was received from the Senate and referred to the Committee on Manufactures.

A Message was received from the President together with a communication to the House containing a statement of supplies sent from the United States to parts of South America for the use of the squadron in the Pacific Ocean, &c.

FOR THE NEW ENGLAND FARMER.

RECEIPT TO STEW A KNUCKLE OF VEAL.

Altered from Gay, and adapted to the meridian of New England.

For a delicate meal
Take a knuckle of veal;
In small pieces cut it;
In a stewing pan put it?
Salt, pepper and mace
May season this knuckle;
What's join'd to a place,*
With other herbs muckle;
What never stands still,
You may add if you will,
To wit *thyme*, or time,
Which goes well in rhyme,
And doubtless will do
Quite as well in a stew.
Your dish will do scarcely,
Sans onions and parsley,
And more things embrac'd
To suit *men of taste*;
But which all and single,
We cannot make jingle—
Perhaps if we could
They would not be good.
If the Cook, all so sly,
Should season it high
Till it bites a man's tongue,
She ought to be hung
Up high in disgrace—
Perhaps lose her place.
The water then turn in
Just to keep it from burning,
The materials cover,
An inch deep, not over;
Then put on a cap,
Sitting tight as a tap,
And keep in the steam,
Or you'll lose all the cream,
Or essence of what
You have in your pot.
Then let it stand simmering
On a fire that's just glimmering,
'Twixt three and four hours,
And then (*O ye Powers!*)
You will have such a treat
As the nicest may eat.
O yes! at the least
As dainty a feast,
As those who may dine
On a fat ox's chine,
Which Homer declar'd
His heroes oft shar'd;
Surpassing ragouts,
Which Frenchmen might choose.
An Alderman might
Smack his lips with delight
To taste such a dish,
Which an epicure's wish
If ever so craving
Would suit to a shaving;
And which would be fare
Good enough for a May'r.

HONORABLE HUMILITY.

Gen. Bauer, who commanded the Russian cavalry in Holstein, was a soldier of fortune,

whose family and country were unknown to every one. When encamped near Hussem, he took a mode of discovering himself, as novel as it was amiable. He invited all his field officers, and some others, to dine with him, and sent an adjutant to bring a miller and his wife, who lived in the neighborhood, to the entertainment. The poor couple came, very much afraid of the summons, and quite confused when they appeared before the Muscovite General. Bauer seeing this, bade them be quite easy, for he intended only to show them kindness, and had sent for them to dine with him that day; at the same time he conversed familiarly with them about the country. At dinner, the General placed the miller and his wife one on each hand, and nearest to him, and paid particular attention to them. In the course of the entertainment, he asked the miller many questions about his family and relations. The miller stated that he was the eldest son of his father, who left the mill he then possessed, and that he had two brothers and one sister. "Have you no other brother?" said the General, "No," replied the miller; "I had once another, but he went away with the soldiers when he was very young, and must have long ago been killed in the wars." The General observing the company much surprised at his conversation with the miller, said to them, "Brother soldiers, you have always been curious to know who I was, and whence I came. I now inform you, that this is the place of my nativity, and you have heard from this miller, who is my elder brother, what my family is." Then turning to the astonished miller and his wife, the General embraced them, saying he was the brother they supposed dead. The General then invited the whole of the company to meet him next day at the mill, where a plentiful entertainment was provided; the General pointed out to his brothers in arms, the room in which he was born, with as much evident joy as if he had been showing the place where he had gained a victory.—*English paper.*

It is the mind that maketh well or ill. The elements of pain and pleasure are every where. The degree of happiness that any circumstances or objects can confer on us, depends on the mental disposition with which we approach them. If you consider what is meant by the common phrases, a happy disposition and a discontented temper, you will perceive the truth of what has been said. A happy disposition finds materials of enjoyment every where. In the city, or the country—in society or in solitude—in the theatre, or in the forest—in the hum of the multitude, or in the silence of the mountains, are alike materials of reflection, and elements of pleasure. It is one mode of pleasure to listen to the music of a theatre glittering with light, and crowded with elegance and beauty; it is another, to glide at sunset over the bosom of a lonely lake, where no sound disturbs the silence, but that of the motion of the boat through the waters. A happy disposition derives pleasure from both; a discontented temper from neither: for it is always busy in detecting deficiencies, and feeding dissatisfaction with comparisons. The one gathers all the flowers, the other all the nettles in its path. The one has the faculty of enjoying every thing, the other of enjoying nothing.

The one realizes all the pleasure of the present; the other converts it into pain by pining after something better; which is only better because it is not present, and which, if it were present, would not be enjoyed. These morbid spirits are, in life, what professed critics are in literature: they see nothing but faults, because they are predetermined to shut their eyes to beauties. The critic does his utmost to blight genius in its infancy: that which rises in spite of him, he will not see; then he complains of the decline of literature. In like manner, the cankers of society complain of human nature, and society, when they have wilfully debarr'd themselves from all the good they contain, are done the utmost to blight their own happiness, and that of all around them. Misanthropy sometimes the product of disappointed benevolence; but it is more frequently the offspring of overweening and mortified vanity, quarrelling with the world for not being better treated than it deserves.—*Port Folio.*

ANECDOTES.

Some time ago, the clerk of one of the Churches of Birmingham, previous to the commencement of the service, dirtied his hand with putting some coals on the fire, and unconsciously rubbing his face, besmeared it so as to resemble the son of Vulcan. He turned into the reading desk, where he naturally attracted much attention, which was considerably increased when he gave the first line of the hymn, "Behold the brightness of my face." The congregation could no longer preserve their gravity, and involuntary laugh burst from every corner of the Chapel.

Napoleon, in his Italian successes, took Hungarian battalion prisoners. The Colonel, an old man, complained bitterly of the French mode of fighting by rapid and desultory attacks on the flanks, the rears, the lines of communication, &c. concluding by saying, "that he fought in the army of Maria Theresa." "You must be old," said Napoleon. "Yes I am sixty or seventy."—"Why Colonel, you have certainly lived long enough to know how to conquer a little more closely."—"General," replied the Hungarian, "I reckon my money, my shirt and my horses; but my years, I know that body will want to steal them, and that I shall never lose one of them!"

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for venting LINCOLN'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

March 27.

MANGEL WURTZEL SEED.

FOR sale at this office a few pounds of Mangel Wurtzel Seed, raised by John Kenrick, Esq., of New York. April 2.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

Correspondence.

the Editor of the New England Farmer,

SIR,—I formerly stated to you, but I believe only in my recollection, a mode of constructing ovens to economize fuel; and referred to the Papers of the Bath & West of England Society, for an exact account of them. I have now found my original extract from those papers, and enclose a copy. I have not made a comparative experiment, to ascertain the proportion of fuel used; but those who have been accustomed to baking common ovens, and of the size suited to private families, pronounce the saving in these new ones to be very great, not less than two thirds, if not three fourths of the usual quantity. Yet the heat is found sufficient to bake loaves, not of wheat flour only, but those of rye and Indian-corn meal, of eight or ten pounds weight, baked as is common in New England, in deep earthen pans. Three such ovens have been constructed for members of my own family; and their experienced superiority to others has occasioned a call for directions for a fourth.

T. PICKERING.

Worcester, May 17, 1824.

Extract from a communication of LEWIS TRUVELL, Esq. on the construction of Cottages for the laboring classes, published in the "Papers of the Bath and West of England Society." Vol. ii. p. 338.

In the other corner is placed an oven made of one brick in thickness ($2\frac{1}{4}$ inches) both at bottom and sides, and not more than one in breadth ($1\frac{1}{2}$ inches) on the top; the whole to be bedded and furrowed on all sides, above and below with four inches of well rammed wood ashes.—"Wood ashes being a bad conductor of caloric, and thence keeping in all heat, such an oven will require more than a third part of the fuel usually consumed in the operation of heating. I had one an oven that being surrounded and in contact, with very thick walls on every side, and into whose substance the unseen fire passed in continued progress, it required twenty faggots to heat it. Of this I soon grew tired, and built another as above described, of the same dimensions, and which (the fire not being suffered to pass beyond a single brick) would be heated at any time (although divested of previous warmth) with three of such faggots, and generally in about a sixth of the time of the former.

As small sized ovens made at the potteries of one entire piece, it would be singularly appropriate to bed them in these ashes, to prevent a migration of the heat beyond their own external parts."

The process, I suppose must be this:—Having determined on the size of the oven, build up the sides as they are to rise perpendicularly; then leaving a space on all sides of four inches, commence the exterior course of bricks, and raise them to the same height; then pour in and ram close the ashes; and continuing to build the interior and exterior courses of brick work, four inches asunder, introduce the ashes as they shall be found convenient. The mason will be able to notice, that the whole foundation of the oven is to be covered with the rammed or hard-pressed ashes.

T. P.

LEACHED ASHES AS A MANURE.

To the Editor of the New England Farmer,

SIR,—I noticed in your paper of the 3th inst. a communication from one of your correspondents requesting some information "relative to the usefulness of leached ashes as a manure."

As I wish to obtain all the knowledge I can, respecting the art and science of agriculture, so I would ever be ready to impart any information I may possess concerning the same, that can be beneficial either to individuals or the community.

Leached ashes, I think may be used as a manure without any fearful apprehensions of the after consequences. I have annually made use of a quantity of them for several years past, without any visible injury to my land. The manner in which I have used them, is by mixing them with my compost manure, putting about one load of ashes to three loads of manure. With this I manure my corn in the hill, and believe that a load of it consisting of one fourth part of ashes is equally as valuable as the same quantity without them; and where I use this manure, I have nothing to fear from the ravages of worms, as it is a sure preventive against their destructive depredations. I am always careful not to use any of this kind of manure with my potatoes, for although it will cause them to flourish and grow, they are always scabby and rough, and not so good as those raised with other manure.

I lately conversed with a gentleman of my acquaintance upon this subject who owns a potash establishment, and who is an experienced farmer. He informed me that he had a high opinion of the value of leached ashes as a manure, and that he made use of large quantities of them both for his grass and corn. He told me that he had a piece of ground which formerly produced scarcely grass enough to pay the expense of cutting and haying it, and naturally subject to bushes and red moss, which now produces grass of the best quality most abundantly. This change he attributed altogether to leached ashes which had been spread upon the land from time to time.

He told me that he made it his rule to ash this piece of ground once in three years at least, for if neglected longer it would get back to its original state. He also informed me that he mixed them with his barn yard manure, and likewise spread them on his pasture land to good advantage, and from the experience of many years, he was fully satisfied that they were not an injury to the land. CULTIVATOR.

Worcester County, May, 1824.

LICE ON APPLE TREES.

Extract of a Letter from Joshua W. Carr, Esq. to the Editor, dated Bangor, Me. May 8, 1824.

"Enclosed is a piece of Apple Tree bark, on which is a specimen of lice, which are very destructive to apple trees in this quarter. I suspect they are peculiar to the eastern part of Maine, as I have never learned that the orchards in Massachusetts were infested with them. Our trees flourish finely, until they are four or five years old, when most of them are attacked by

this insect, and unless they are scraped off, soon destroy the tree. White-washing, ashes, and tobacco juice, do not appear to have any effect upon them, although applied the last of June, when the young ones first appear. Perhaps some of your correspondents, better acquainted with cultivating orchards, than we are in this country, can prescribe a remedy, which will confer a favor on many."

HEDGE FENCES.

Extract of a Letter from James Whitlaw, Esq. to the Editor, dated Ryegate, Vt. May 17, 1824.

"As timber is becoming scarce, which makes fencing very expensive, we must soon have something to supply its place. We have stone sufficient in many places, but in others they are scarce. In Scotland, the land of my nativity, the lands are principally inclosed with thorn hedges, which in three or four years after planted make a sufficient fence, and with a little care will last an age. Will you insert an article in the New England Farmer, inquiring of your correspondents if any of them have made trial of raising hedges, and request them to state of what sort of shrubs they are composed, the mode of procedure, and their success? Their replies may lead to some useful information. We have thorns here which are suitable for the purpose, and may easily be multiplied."

MILLET.

Extract of a Letter from Mr. Joel Aldrich, to the Editor, dated Smithfield, R. I. May 20, 1824.

"Being on the Hon. Josiah Quincy's farm, in the month of August last, if I understood his farmers correctly, they informed me that a few days previous they sowed a very large field of Millet. I am desirous to be informed at what time that was cut, the manner of cutting and preparing it for fodder, and the advantage to be derived from that manner of raising fodder. The information may be given through the medium of thy paper, or in any way most convenient to thyself."

From the Port Folio.

ON MILLET.

To the President of the Pennsylvania Agricultural Society.

I recommended, in the early part of the last year, the cultivation of Millet for fodder, and stated the success I had met, in its use as a food for neat cattle. I have since cultivated it much more extensively, and have been confirmed in the impressions I had conveyed, as to its management—its product—and its value, when applied to the support of horses, and black cattle, although I am satisfied, that it is not so well fitted for the use of sheep, as clover hay. The unusual drought of May and June, materially affected the growth of early sown Millet—the heavy rains in July and August injured as much in many cases, the quality of its fodder. I sowed ten acres of land in good tilth, with Millet, red clover, and orchard grass seeds; they were all lightly harrowed, and carefully rolled. As

the success of the grass, was more important, than the weight of the Millet crop, I sowed but two pecks of Millet seeds per acre, half the quantity which I am accustomed to use, where I desire a heavy crop of fodder. In despite of the injuries caused by the want of snow, during the winter, I have never had before so fair a prospect of thickly set sward. I should not adopt this practice generally since Millet must be sown so late, as to expose tender grasses, to the evils of drought in July and August, before they can be sufficiently strong to survive them.

Millet should never be grown upon land which is not in good condition and very fine tilth. The seeds should be lightly covered by a harrow with wooden teeth, and after rolled. Of thirty acres upon which my last crop was grown, I tried various experiments. The field which was the most lightly harrowed was the most productive. I am led to believe however necessary the harrow is in all cases, to properly cover seeds, yet in few it is used with sufficient care, or in a fit shape. Excepting winter grains I know no seeds which are not I think usually too deeply buried.

JOHN HARE POWELL.

Powellton, Phil. Co. April, 10, 1824.

For directions and remarks relative to the culture of Millet, see *New England Farmer*, vol. i. page 59. Also page 277 of the same volume, which contains Col. Powell's statement alluded to above. Mr. Cox's remarks on page 299. And, in the 2d volume of our paper, pages 306 and 307 are "an Extract of a letter from the Hon. Bushrod Washington relative to the culture of Millet," and "Extract of a letter from John Hare Powell, Esq. to Jonathan Roberts, President of the Pennsylvania Agricultural Society." We should be glad to receive some account of the culture, application, &c. of this plant, as well on the farm of the Hon. Mr. Quincy, alluded to above, as on the estates of other New England cultivators, and shall ever be happy to publish all the information on the subject which we can obtain.

On the value of, and different modes of preparing, Burnt Earth for Manure.

[From *Essays on Practical Husbandry*, by Edward Burroughs, Esq. Essay Second. On Manures and their application.]

This substance being but little known as a manure, and being highly valuable on most soils, merits the particular attention of the cultivator; it has also this particular recommendation, that there are but few farms on which it cannot be prepared, and can be obtained at a cheaper rate than most other manures.

By the term "burned earth," is to be understood, any species of soil that is capable of being torrefied or dried up by excessive heat preserving at the same time, its original staple after that operation. Clays of all sorts, and strong loams, will answer well for this purpose; but moors and sandy soils, being deficient in tenacity, will not torrefy to advantage as I shall, in its proper place, explain. It is necessary to observe, that this mode of preparing earth as a manure, is upon a principle very different from that of reducing it to ashes; and though the effect produced on the land on which it is applied may be apparently the same, yet the torrefied substance is by far a more permanent manure.

The chemical difference in the preparation

is this:—In reducing the soil to ashes, much of its fertilizing properties are dissipated, and its vegetable matter destroyed: but, when torrefied, those properties are preserved, and its vegetable matter only reduced to a state more valuable as the food of plants. There are two sorts of burned earth: 1st, That which is produced from the subsoil; and 2dly, That which is produced from the surface, or upper soil. I treat of them severally in order to show how they are to be appropriately applied, and to point out the best mode of preparing them under different circumstances.

First.—Subsoil calculated for this purpose may be said to be of two kinds, viz. adhesive clay and calcareous earth; the former seldom possesses any fertilizing properties in its natural state; but the latter is generally a valuable substance, even in this state. As alternatives to the soil they may be a good application if appropriately applied, and may produce fertility accordingly; but, by putting them through a process of torrefaction, however naturally deficient in fertilizing properties, they can be converted into valuable manures. Hence it would appear that the most fertile subsoil would be the most advantageous to torrefy, and this I have no doubt, is the case; but as the process will make any description of soil a valuable manure, the only object is, to procure that which will answer best for this purpose.

The most simple and the cheapest method of preparing this manure, is, to excavate a place in the pit out of which the subsoil is to be raised for this purpose, and in this place to build the kiln. The subsoil will then be convenient to throw on the kiln; and the culm for assisting in burning of it may also be laid down convenient, as it is wanted. The kiln is burnt in the following manner, viz.

An arch of about four or five feet long, three wide and two high, is made with well burned brick; the front of which is close like an oven, and the inside fitted to receive a strong fire of coals. On the top of the arch six or eight holes are left, the size of a small brick, to admit the heat passing out, which is so communicated to the earth laid on. When the fire is sufficiently strong the door of the kiln is to be well stopped, and the earth thrown on in some degree pulverized, about six or eight inches thick, so as to cover the top of the kiln, and every direction around it to which the heat might communicate. In this manner it is to be dressed alternately with culm and earth, which are to be laid on accordingly to the heat of the fire, which is on no account to be permitted to burn too strong.

After the kiln is once well lighted, it will burn several hundred bushels of earth without any additional fire inside; and the same kiln will answer for a length of time to renew the process when it may be necessary.

The substance which I saw put through this process on the lands of Doveridge, was a yellow clay of a strong nature, and liable to become calcined by excessive heat, which Lord Waterpark found to be the case on the first commencing his experiments. However, on reducing the strength of the fire in the kiln, and not giving so heavy a dressing of culm between the layers of clay, the heat was sufficient to produce torrefaction; and when the clay was carted out, it was in a mellow and pulverized state.

This was applied, in the month of April, on a field that had produced barley the year before, and the soil of which was nearly similar to the subsoil applied on it.—The result was, that the most excellent crop of barley was obtained by this dressing, even better than on another part of the same field which had been limed in a sufficient quantity, and treated in the same manner.

Subsoil may also be torrefied in kilns made of sods, or mud and straw, as follows:—On a headland or waste piece of land, off which sods can be had sufficiently old to build walls, erect four parallel to each other, and forming a square of eight feet in the clear; let these be well joined at the angles by crossing the sods, and raised about four feet high at the commencement, and twenty inches thick. Through the centre of the four walls, and on a level with the surface, cut flues, so that they will all meet in the centre of the kiln, about five or six inches deep, and four wide, which are to be covered by sods on the top, leaving intervals between them of less than an inch. These flues are to be kept free of clay or rubbish, and the mouths well open to the air.

In the centre of the kiln place brushwood, turf, or other combustible matter; also some small blocks of wood to strengthen the fire; and when all is well kindled throw on some culm and then clay, and so on, as you find the fire sufficiently strong to take dressing always observing to keep the heat of the kiln as even and as moderate as possible, just of sufficient strength to expel the moisture from the layers of clay as they are thrown on. Much care should, however, be taken not to cover the fire too soon after being lighted, which would be likely to extinguish it totally.

The reason of raising the walls at the commencement only four feet is, that the firing may be more readily placed in it; but, during the burning, they should always be kept eighteen inches higher than the centre of the kiln, in order that the wind should not have power on the surface of the fire. As soon as the kiln is strong kindled, two flues should be stopped, observing always to keep those open which face as much as possible the windward point; should the kiln burn too strong, one of those will be sufficient to leave open. It will often happen that the kilns will burn to a height of eight or nine feet; but is of no advantage to let them burn higher than seven feet, as the inconvenience of dressing them, when so elevated adds too much to the expense.

When kilns are well managed, one of the size I have described would be burned in about six weeks, at the end of which time the walls would be so torrefied as to become of equal value, as manure, with the interior of the kiln; however, it cannot be expected that they will be in a state sufficiently pulverized to put out the same time for a crop: it would, therefore, be advisable to have them broken down as soon as the kiln has burned out, and to mix and blend together. About two months after this preparation, it will be in good order to put out for a green crop; but, for a corn crop, it should be in the highest state of pulverization. Calcareous earth is considered by some scientific farmers, the best substance for burning, on the principle that the calcareous matter which it contains as reduced to lime in the process of torrefaction; therefore, lime being, in their

tion, the best burned substance which can be produced, the manure the most replete with it must be the most valuable. Now there are two matters to be ascertained before this theory can be admitted:—1st, Is lime a greater fertilizer of soils in general than torrefied earth? and 2dly, whether in the process burning any subsoil which has a large portion of calcareous earth, the effect which should be produced by torrefaction would be counteracted if there were sufficient fire applied to reduce the calcareous particles to lime?

First.—Lime being established as a valuable application on many soils, it would be no easy matter to persuade those who have not tried unburned earth as a substitute, that it possesses more fertilizing properties; but then experience, by which all must be governed, has convinced me that this latter substance is by far more valuable on many soils, than lime. I have tried it on clayey, on light soils, and on moory soils, all of which it produced good crops of potatoes and turnips, and afterwards corn? and, in a instance in particular, where lime had been applied ineffectually, a dressing of burned clay made the land yield most abundantly. Lime stimulates and pulverises the soil; whereas unburned earth not only possesses those properties, but contains in itself enriching and valuable qualities. The following experiments will serve to corroborate these assertions.

In a wheat stubble (the soil a light sandy one) which I had gravelled as a preparation for a crop I sowed barley in the following spring, the land being winter fallowed, and in October, part of the field I dressed with burned clay in compost. The crop was sown, and reaped on both parts equally alike; but the portion of the field on which the burned earth was applied produced by far the best quality of grain, and also a greater quantity to the acre.

In a moory field, which I prepared for a potato crop, I applied a heavy dressing of strong lime and lime compost, (not considering the lime sufficiently strong to take pure lime with clay); part of the field remained undressed until May, for want of stuff to lay on, and being late in the season, my farm yard dung was consumed. I therefore, had no alternative but to prepare some burned earth, by digging the head lands, which was laid on the remainder of the field about the 20th of May, and potatoes planted. The result was most encouraging, the crop on this part of the field being much better than where the lime and clay had been applied.

I will now proceed to show the mode of preparing the surface, or upper soil, so as to produce a very valuable manure. Head lands on tillage fields are the principal source from which to obtain earth for this purpose; let me be what it may, if it adheres to the surface when dug, it can be torrefied in a kiln by the use of sods, in the manner I have already described; but, then, the principle on which these sods are burned being different from that of preparing subsoil for this purpose, it is necessary to state the process minutely.

The kilns be made of sods they may be immediately lighted on being finished; but if straw and straw, they should be permitted to burn before it is applied. Any labouring man, the habit of building huts with sods or other materials, will prepare a kiln without difficulty; and

as it is not necessary that neatness should be observed, five or six men could erect one in a day. The walls however, when made of sods, should be beat close with the spade, in order to prevent them from drawing air, by which the burning of the kiln would be much retarded.

The successful burning of these kilns chiefly depends on the judicious manner in which the kindling is placed in them and the sods laid on the fire; for they are not to be dressed with any combustible matter alternately, as is the case when the subsoil is burning. The entire operation is performed by the heat from the body of the kiln passing through the interstices of the sods, and which are formed by laying them loosely and openly on the top of each other. It is therefore advisable, that the sods used for the purpose of dressing the kiln, should be cut as square and lumpy as possible, and of a size that they can be easily handled, so as to lay them on the kiln carefully:—loose earth should not be thrown in on any account.

The best materials for lighting the kilns are, turf and coarse lumber; but where those cannot be procured, any kind of brushwood and coals may be substituted with effect; but the fire should be made stronger in those kilns than when subsoil is to be burned. It will be necessary to lay on the sods very expeditiously on the fire being properly kindled; otherwise the combustible materials would be exhausted before a sufficient quantity of the sods was heated: and on this chiefly depends the successful burning of the kiln. For this reason, it would be necessary to light them early in the day, in order that they may be well covered before sun set. In dressing them, the sods should be laid close to the walls; and the centre kept a little elevated; and those points where the fire breaks out strongest, should be heavily covered, as the kiln would be exhausted by permitting the smoke to pass too rapidly away.

Fly Water.—Most of the fly waters, and other preparations commonly sold for the destruction of flies, are variously disguised poisons, dangerous and even fatal to the human species; such as solutions of mercury, arsenic, &c. mixed with honey or syrup. The following preparation, however, without endangering the lives of children, or other incautious persons, is not less fatal to flies than even a solution of arsenic. Dissolve two drachms of the extract of quassia, in half a pint of boiling water; and adding a little sugar, or syrup, pour the mixture on plates. To this enticing food the flies are extremely partial, and it never fails to destroy them.

Remedies against Fleas.—Fumigation with brimstone, or the fresh leaves of penny-royal sewed in a bag, and laid in the bed, will have the desired effect.

Best Mode of avoiding the fatal Accidents of open Carriages.—Jumping out is particularly dangerous (the motion of the gig communicating a different one to the one you give yourself by jumping,) which tends very much to throw you on your side or head: many suppose it very easy to jump a little forward, and alight safe; 'tis supposition; they will not find it so on trial. The method of getting out behind the carriage is the most safe of any, having often tried

it, when the horse has been going very fast.—Perhaps it is best to fix yourself firm, and remain in the carriage.

Remedies for the Stings of Bees.—The application of laudanum gives immediate relief, and a strong solution of salt in water is also recommended. Care should, however, be taken in the first place to extract the sting of the bee with a steady hand, for if any part of it breaks in, remedies will be much less effectual than they would otherwise prove.

The Stone.—It appears that the French surgeons have obtained a triumph most honorable for themselves, and most precious to humanity. Civiale has succeeded in curing the disorder of the stone without the operation of cutting.—His method consists in the introduction of an instrument, which seizes the stone, then crushes it, and reduces it to powder. This ingenious process is far less afflicting, and does not compromise the existence or even the health of patients.—*Paris paper.*

From the Columbian Centinel.

MR. RUSSELL.—Much has been said and written the existing laws requiring the Imprisonment of debtors, as not only barbarous, but ineffectual for rendering the desired benefit to creditors. A general proclamation has been made throughout the country for the abolishment of Imprisonment for Debt, but a substitute thereto has never been presented to the public, and very dangerous consequences must inevitably attend the annihilation of the present existing laws, without some judicious provision instead; and a disinterested effort has been made by an individual of this city, eminent for his talents and integrity, who has devoted about six months of close application to the subject of devising a system which shall more effectually secure justice to the creditor, and protect the debtor from imprisonment; and the result of his labors is just completed in manuscript; with a perusal of which, I have been indulged, and of its well guarded provisions I am delighted and pleased. While it appears to protect the creditor as completely from the fraudulent artifices, as human art can devise, it is equally effectual in its lenient provisions for protecting the honest, oppressed debtor from disgrace and imprisonment. A method for designating the honest from the fraudulent debtor, which the sufferings of society have imperiously demanded, is admirably engrafted into this system.

A critical review of the work, would occupy many pages for recording just commendations, and in pointing out the complete revolution and the beneficial influence it would produce in the morals of society.

The author of this system is BENJAMIN DEARBORN, Esq. who deserves well of his country for many useful improvements in the arts, and whose life has been almost incessantly devoted toward promoting the interest of the community, and alleviating the distressed and wants of the suffering and oppressed.

I do most sincerely hope that the system will shortly be published from the proceeds of a generous subscription, which shall enable a very extensive circulation, at least through the United States, and be duly appreciated by an enlightened public.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.
No. VII.

At the request of the writer, Mr. Baylies has furnished him with a sketch of his remarks, in the House of Representatives, in favor of the increase of duty proposed on Leghorn hats. They are highly interesting, quite to the point, and furnish materials for melancholy reflection, upon the indifference exhibited by our Representatives, to the source of wealth which the Manufacture to which they refer, opens to the United States.

A Friend to Agriculture, Commerce and Manufactures.

Remarks of Mr. BAYLIES, of Massachusetts, on his motion to amend the Tariff, by striking out the minimum of one dollar on Leghorn Flats and Hats, and inserting three dollars.

I am aware, that by altering the minimum price on which the cost of this article is to be estimated, from one dollar to three, a high duty in proportion to its cost, will be imposed.

It has been assumed as a principle in the course of the debate on this bill, (the Tariff) that a protecting bill ought to be given in such manner, and to such an amount, as shall enable the domestic manufacturer to compete on equal terms with the foreign manufacturer in the domestic market. This principle will not apply to my motion. It is my design, I admit, to exclude these flats and hats from our own market, and that exclusion is to be wished, by all who are friends to domestic economy, as well as domestic industry.

During the year ending September 1822, the amount of the cost of Leghorn hats and flats, as estimated for the purpose of ascertaining the duty, was about \$610,000.

During the last year the Treasury estimate is \$313,391.

If the importation of the fabrics of Leghorn was prohibited, trade would not be injured. We do not exchange our commodities for Leghorn bonnets and hats, but the proceeds of half the American trade in the Mediterranean, are invested in these straws, which otherwise would have been invested in articles more necessary, less costly, and paying more freight.

But my object, Mr. Chairman, is to protect, to encourage, and to renew a branch of a domestic manufacture, which has been ruined by the introduction of the straws of Leghorn.

Some twenty or twenty three years since, a young lady either of Franklin or Wrentham, in Massachusetts, was induced merely for the purpose of experiment, to undertake the fabrication of a bonnet from straw. Her experiment succeeded, and in consequence of her success some of the females who lived in her vicinity, were also induced to try the experiment, and they also succeeded. In the neighborhood the business soon became general. All bonnets and hats for domestic use, were fabricated at home. These bonnets were at length introduced by the country traders, into the cities and seaports, and met with a favorable reception. In the year 1806, I met a New York trader on a journey, who informed me, that he had purchased straw bonnets at Wrentham, to the amount of *ten thousand dollars*. I well recollect my astonishment at this information, for so ignorant was I at that time, of the extent of this business, that I did not be-

lieve that bonnets to that amount were manufactured in all the states. The English Dunstables were excluded from the American market, by the American straws, which surpassed them in elegance, durability and cheapness.—Fashion soon gave them currency and they met with a rapid and profitable sale in the markets of Boston, New York, Philadelphia, Baltimore, Norfolk, Charleston and Savannah.

At the commencement of the late war this manufacture was in its most flourishing state.—I was told on good authority, that the annual amount of the sales of straw bonnets manufactured in ten adjoining towns, (townships,) in Massachusetts, was \$500,000. The whole amount has been stated by the chairman of the committee on manufactures to have been \$300,000; and a circular from some gentlemen of respectability who are well acquainted with the subject, states the amount to have been in some years \$1,500,000.

The straws were woven and shaped by young unmarried females, of that class whose labor is not generally productive. The work was done in families under the paternal roof, and by the domestic fire-side, and never was labor sweetened with such rewards. I have known, and I have heard of many farmers who were relieved from embarrassments and mortgages, by the labor of their daughters, and those daughters when married could carry to their husbands marriage portions, frequently of a thousand and sometimes of two thousand dollars, which is an establishment for any young farmer in New England. The profitable exercise of this employment extended its benefits, not fanciful, not speculative, but real, to all the neighboring farmers. Their unproductive lands were devoted to the culture of rye. Eighty dollars have been offered and refused, for the rye growing on a single acre. The face of the country was improved, and a vast addition was made to the value of the soil, by multiplying its capabilities. The comforts of the farmer were increased, his falling fences were reared, his decaying house was repaired, taste came in with her embellishments, and neatness and plenty literally united around the hut of poverty. Sad indeed is the reverse. Cold and cheerless wait, once more revisits the mansions of the poor.

The caprice of fashion has introduced an article manufactured from the straw of Tuscany, which, to say the least, has deprived numerous American families of many of their comforts. The tulip-mania of Holland was not so ruinous to that nation, as the mania for wearing Leghorns is to this. The vast amount which was formerly paid to our own citizens, which gladdened the poor man's heart, which increased the productiveness of our soil, and relieved our citizens from debt, is given to the Tuscans! Fashion has said that it is *ungentle* to appear in a domestic bonnet!—a word has ruined a manufacture which subsisted thousands!

Sumptuary laws are not justifiable, could they be justified in any case they would be, in this.

Should the motion now before us prevail, I think it will go far towards the exclusion of the coarser, and least valuable fabrics of Leghorn; and if our country women choose to pay \$50 or \$60 for a Leghorn, when one of home manufacture could be purchased for six, it becomes a proper subject for high duty, and if they will, with this high duty, continue to wear the for-

eign fabric, the revenue will be benefited, and the nation will gain something, by taxing a folly which cannot be prevented. If on the other hand, the importation is prevented, you will restore and revive a branch of manufacturing industry which cannot injure the nation, and which will enrich it.

From the Hampshire Gazette.

GYPSUM.

We have frequently heard farmers remark that gypsum or plaster has no effect on some of their lands, where it operated powerfully a few years ago; and we are informed that the quantity of this article used in the towns on the Connecticut river is diminishing yearly. It appears from an address of Culbert Powell, Esq. President of an Agricultural Society in Virginia, "that plaster has ceased to produce any visible effect upon vegetation on land in Virginia, where it has hitherto been long and freely used." Mr. P. proceeds to account for this seeming mystery. He adopts the opinion of Sir Humphrey Davy, that gypsum forms a part of the food of certain plants, as clover, and other artificial grasses, and is intimately combined as a necessary part of their woody fibre, and that the reason why it is not generally efficacious, because most soils contain it in sufficient quantities for the use of the grasses. Sir Humphrey found, on analysing soils from several counties of England, where gypsum produced no effect, that they already contained a sufficiency of it in their composition. Mr. Powell concludes from these facts, that the lands in Virginia, on which plaster has been so operative in years past, were naturally deficient in that material; if the use of it removed the natural defect, it brought into action the other productive materials of the soil, which could not be wrought without it; and that a course of luxuriant crops thus produced has exhausted the other materials of vegetation, which must now be supplied an application of animal and vegetable manure.

REMARKS.—The foregoing observations relative to the inefficiency of plaster of Paris, when it has been applied for a series of years, although its first operation were beneficial, are corroborated by the experience of many cultivators. Jonathan Roberts, Esq. President of the Pennsylvania Agricultural Society, in an address to that Society, states that farmers can well collect how beneficially gypsum or plaster of Paris was exhibited as a manure, and that in the course of eight or ten years after its general application, the soil afforded neither a wholesome summer pasture, nor winter fodder. Recourse was then had to the culture of fibrous rooted grasses.—An evident diminution of the ploughed crops followed. Of these grasses, timothy was found to be the most productive, but the most pernicious to the soil. It was recommended by Sir Humphrey to mix with clover, but with these qualifications it is in but very little estimation at present among experienced farmers. The orchard, ray and herd's grass appear to be entitled to no preference over the timothy grasses of our country; they do not afford so rich a sward for the plough. The clover at present seen in the field has regained its original value. The cause of its deterioration or recovery I pretend not to explain.

The use of gypsum for a while superseded the use of lime—during that period the soil became sad and unproductive. A recurrence to its use produced the former results, an open and productive soil. The effect of lime on grass crops in this second year, is

has been scarcely less visible and valuable than the effect of plaster when first applied. This precious mineral abounds throughout our country. It seems (lime-stone) an essential ingredient in restoring and improving the fertility of soils. Our farmers well understand this, and they now apply it to an extent and expense alike creditable to their enterprise and intelligence. But to realize its full benefit, it must be accompanied with moderate dressings from the barn and other periods from seven to nine years."

There does not appear to us to be any thing mysterious or unaccountable in the fact that plaster of Paris, applied in too great quantities and for too long a time would cease to produce a good effect. The best judgment tells us that gypsum produces its beneficial results in two ways, to wit, by stimulating the young vegetable, and giving it, as it were, an appetite for its food, and entering into the substance of some plants, a necessary constituent of their organization, which is said to be imperfect without it. Considered as a stimulus it is obvious that a small quantity only is wanted. Too much gypsum given to a vegetable will no more induce to its growth and healthy condition, than too much pepper, salt or alcohol would produce the same effect with regard to an animal. And, as respects some plants which require gypsum to make a part of their substance, and in which it is of course detected by chemical analysis, small quantities only of gypsum are wanted, and if you supply it in large quantities you counteract the law of nature relative to feeding and manuring such plants. "In the common course of cultivation," says Sir Humphrey Davy, "gypsum is ruined in the manure, for it is contained in stable manure and in the dung of all cattle fed on rye; and is not taken up in corn [grain] crops, or crops of peas, beans, and in very small quantities in turnip crops; and where lands are exclusively devoted to the storage of hay it will be continually consumed."

The principal food of plants, (or that substance of which they consume the greatest quantity) is carbon, or coal matter. This goes to constitute the woody fibre, and is a constituent in other products of vegetation. Carbon and its compounds are the principal ingredients in stable and barn-yard manure. Such manure is very efficacious, because it furnishes the greatest quantity that substance which plants consume in the greatest quantity. But a pint will not grow in a dung heap, because it cannot be exclusively on carbon, and other products which that kind of manure can yield. It dies of a surfeit of its favorite food, when placed in that situation.

A cultivator may as well over-manure his plants as the contents of his stable and cow yard as with water of Paris. His crops require more, and will do more of the former than of the latter; but he may give them too much of either. "Change of pasture makes fat calves," and change of manure makes crops. It is a sound judgment, and knowledge of the subject must be exercised in such alterations to insure against a change from bad to worse.

We do not pretend to say by what cause *omode of* oration a soil which, as Mr. Roberts assures us, had become "saddened and unproductive" by the use of plaster should be rendered "open and productive" by using lime. Common limestone consists of limon and carbonic acid, and plaster is composed also of lime together with sulphuric acid. Both these substances therefore contain one of the same materials, and it may well puzzle a philosopher to explain how one of them could remedy the defects of, or present an antidote to vills produced by the other. It is not fitting, however, for us to deny effects, because we cannot explain the causes.

We know that results may be produced from compounds very different from what could be brought about by the ingredients of such compounds, if such ingredients were separately applied, or were used in different proportions.

ON THE IMPORTANCE OF CHEMISTRY AS CONNECTED WITH AGRICULTURE.

Were I addressing myself to the father of a family, I would say,—Is your son born in opulence,—is he an heir to an extensive domain; make him an analytical chemist, and you enable him to appreciate the real value of his estate, and to turn every acre of it to the best account. Has he a barren tract of country, which has been unproductive from generation to generation; he will then carefully explore it for hidden treasures, and will probably not explore it in vain. By analysing the minerals which he discovers, he will ascertain with facility and exactness what proportion of metal they contain, and which of them may be worked to advantage. Thus he will operate on sure grounds, and be prevented from engaging in expensive and unprofitable undertakings.

Chemistry will teach him also how to improve the cultivated parts of his estate; and by transporting and transposing the different soils, he will soon learn some method by which each of his fields may be rendered more productive.

The analysis of the soils will be followed by that of the waters which rise upon, or flow through them; by which means he will discover those proper for irrigation; a practice the value of which is sufficiently known to every good agriculturist.

Should he himself occupy the farm, and become himself the cultivator of his own estate; he must of necessity become a chemist, before he can make the best of his land, or put it into a high state of cultivation, at the smallest possible expense. It will be his concern not only to analyse the soils on different parts of his farm, but the peat, the marl, the lime, and the other manures must be subjected to experiment, before he can avail himself of the advantages which they possess, before he can be certain of producing any particular effect by their means. The necessity of analysis to the farmer is evident from a knowledge of the circumstance, that some kind of lime is really injurious, and would render land which had been hitherto very productive, actually sterile.

I allude here to the magnesian limestone, which is common in many districts in England, particularly at Breedon in Leicestershire, where the calcareous earth contains 50 per cent. of magnesia. But, as the Earl of Dundonald has remarked, such lime will be extremely useful on what are called sour soils, or such as contain sulphate of iron, from the decomposition of martial pyrites, as the magnesia will unite with the acid of that salt and form sulphate of magnesia, (Epsom salt) which greatly promotes vegetation.

Besides, a knowledge of the first principles of chemistry will teach him when to use lime hot from the kiln, and when slacked; how to promote the putrefactive process in his composts, and at what period to check it, so as to prevent the fertilizing particles becoming effete, and of little value. It will also teach him the difference in the properties of marl, lime, peat, wood ashes, alkaline salt, soap waste, sea

water, &c. and consequently, which to prefer in all varieties of soil. A knowledge of the chemical properties of bodies will thus give a new character to the agriculturist, and render his employment rational and respectable."

Parley's Chemical Essays.

From the Columbian Centinel.

CAUTION.

The public are cautioned against using *Cheese covered with Lead*, whether red or white, as both are poisonous.

The attention of the public is invited to the following facts:

In this town a Cheese was bought last year, and four of the family immediately upon eating some of it, were taken severely sick. The cheese was examined by the attending physician, and judged to be overlaid with red lead. The same cheese was eaten by several others, the rind being previously taken off, were soon very sick. When thrown off the stomach they were relieved.

A few weeks ago, three of another family became exceedingly ill, cause unknown; but was soon supposed to be produced by Cheese, covered with white lead. A dog which ate the rind was extremely convulsed, and in a day or two died.—Another ate of it and became very ill; to which a dose of lamp oil was given, and having cast up the rind, which remained almost entire, recovered.—A third dog, which took but little, was sick. Fifteen or twenty persons in this town the last year and this, have been made sick, and most of them very sick by means of lead on cheese. And doubtless many become sick, and may die by the same means and know not the cause. Attending physicians say the symptoms in these cases are what they should expect lead to produce, and can assign no other cause of those affections. Besides, trial has been made and satisfactory evidence obtained that red and white lead covered the Cheeses in question.

The public are cautioned against using any cheese brought to our markets without due examination. And ought not Cheese to be inspected, before sold in market, with particular reference to this article? Human life and health are too precious to be trifled with in this manner. Doubtless thousands have thus been destroyed, and never knew the cause of their excruciating distress, and have little thought that their bane was brought from the dairies of our country.—Should it be thought desirable, probably the venders of these Cheeses might easily be ascertained, and, if necessary, shall be made known. *S. Reading, May 1824.*

A valuable counterpart to the "cotton gin," the invention of two citizens of Vermont, (Tyler and Andrew), has been introduced into Georgia. It is a machine for threshing rice,—is operated by two or three horses—and obviates inconvenience in the rice plantations heretofore severely felt. "One very valuable appendage to the machine is a cutter, which cuts the rice straw to any length desired with incredible rapidity, and will render, what was before nearly waste, an excellent article, when mixed with the flour and chaff, for the fattening of cattle during the winter." This machine is not entirely a new invention—others on the same principle having been advantageously employed in the threshing of corn, rye, and other grains; but the first application of its powers to threshing rice was made near Darien a week or two since. It is said in a Georgia paper that fifty bushels of rice have been threshed by it in an hour, and that it may be constructed so as to thresh an additional ten bushels in the same time.—*N. Y. Patriot.*

NEW ENGLAND FARMER.

SATURDAY, MAY 29, 1824.

FARMER'S CALENDAR.

[Continued from page 342.]

MAKING CHEESE. The Massachusetts Agricultural Repository gives the following directions for this process.

"Breaking the curd is done with the hand and dish. The finer the curd is broken the better, particularly in thick cheeses. The best color of this kind of cheese is that of bees wax, which is produced by Arnotta, rubbed into the milk after it is warmed. The dairy woman is to judge the quality by the color of the milk, as it differs much in strength. [The rennet is then prepared as stated page 342 of the present volume of the New England Farmer.]

"Setting the milk too hot inclines the cheese to heave, and cooling it with cold water produces a similar effect. The degree of heat varies with the weather. The curd when formed is broken with what is called a treple cheese knife. The use of this is to keep the fat in the cheese; it is drawn the depth of the curd two or three times across the tub, to give the whey an opportunity to run off clear; after a few minutes the knife is more freely used, and the curd is cut into small pieces like chequers, and is broken fine in the whey with the hand and a wooden dish. The curd being allowed about half an hour to settle, the whey is laded off with the dish, after it is pretty well separated from the curd.

"It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added and stirred a few minutes; some make use of hot water in preference to whey, and in both cases heated according to the nature of the curd; if it is soft the whey or water is used near boiling; but if hard it is only used a little hotter than the hand. After the curd is thoroughly mixed with the hot stuff, it is suffered to stand a few minutes to settle, and is then separated as at the first operation. After the scalding liquor is separated a vat, or what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hands and pressed into the vat, to squeeze out the whey. The vat being filled as full and as firmly as the hand alone can fill it, and rounded up in the middle, a cheese cloth is spread over it and the curd is turned out of the hoop into the cloth; the vat is then washed and the inverted mass of curds, with the cloth under it, is returned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out and the cloth is taken off, washed and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and salted, the cheese is placed on a board and a handful of salt is rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewn on the upper side, and as much left as will stick to it; afterwards it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press; here it continues one night; and the next morning it is turned into the vat, and continues till the succeeding morning, and the

curd is taken out and placed on the dairy shelf: here they are turned every day or every other day, as the weather may be. If it is hot and dry, the windows and doors are kept shut, but if wet or moist, the doors and windows are kept open night and day.

"**CLEANING THE CHEESE.** The cheeses having remained about ten days after leaving the press, are to be washed and scraped in the following manner:—a large tub of cold sweet whey is placed on the floor, the cheeses are immersed in it, where they continue one hour, or longer if necessary, to soften the rind. They are then taken out and scraped with a common case knife, with great care, so as not to injure the tender rind, till every part of the cheese is smooth; they are after the last operation rinsed in the whey and wiped clean with a coarse cloth, and placed in an airy situation to dry, after which they are placed in the cheese room. The floor of the cheese room is generally prepared by rubbing it with bean or potatoe tops or any succulent herb, till it appears of a black wet color; on this floor the cheeses are placed, and turned twice a week, their edges are wiped hard with a cloth once a week, and the floor is cleaned and rubbed with fresh herbs once a fortnight. They must not lie too long or they will stick to the floor. This preparation of the floor gives the cheese a blue coat, which is considered of great consequence."

NEW MODE OF PLANTING POTATOES. A friend of the Editor has been so good as to furnish us in manuscript with the following. We have had no experience nor personal knowledge of the process recommended, but wish it might be tried, and its results made public for the benefit of the community.

"*An easy and cheap method of raising Potatoes.*—On an even and smooth piece of mowing or pasture land, make deep single furrows with a plough at three feet distance. Fill these furrows with rye [or any other] straw, and drop your potatoe 6 or 8 inches apart on the straw. Then, with a hoe, cover the potatoe by turning down the ploughed furrows upon them.—They will require no more attention till they are grown. No hoeing will be necessary.—The same land may be improved as a pasture for sheep, as those animals will not eat, nor materially injure the tops of the potatoe."

The writer is informed that this method is practiced with success in the towns of Winchester and Swansey in New Hampshire.

TO CORRESPONDENTS. The first article in this day's paper, communicated by Col. PICKERING, will be found very useful, and applicable to one of the most important processes of domestic economy. The saving of at least two thirds of the fuel in heating an oven is no trifling matter. The mode by which this saving may be accomplished is so simple, and may be put into practice at so small an expense that we think the period cannot be very far remote, in which it will be generally adopted, not only by Bakers by profession, but by housekeepers generally. It is moreover not a thing of theory, but a principle, which has been put, successfully in practice.

We are under great obligations to "CULTIVATOR" for his article on *leached ashes*, and think that his observations, corroborating other testimony in favor of the same substance, will establish its credit as a valuable manure.

Mr. CARR's communication, with which was transmitted a piece of Apple Tree bark, infested with lice, has induced us to endeavor to recall to memory what we have formerly observed relating to those insects, and to make enquiries of gentlemen in this vicinity, most competent to give us information on the premises. Lice on apple trees, some years since were, and we believe still are, very common in New Hampshire and Vermont. We are told, likewise, that they are by no means a scarce article in Massachusetts. The remedy most common is scraping the body of the tree on which they fasten. It is said that a swab or mop, wet with hot water, and applied early in June will destroy them. We are, moreover assured by a practical orchardist, that strong soap suds will cause these insects to disappear, as well as prove serviceable in other respects to the tree. We should be happy to obtain further information from correspondents on this subject, including, if convenient the natural history of the insect, and the remedy against the mischief it occasions.

Mr. WHITEHEAD's request for information respecting *Hedge* will, we hope meet the attention of our public spirited *Cultivator*, whose experience may render their remarks interesting and useful. Should there be no volunteers in this service we will turn out, and furnish all the knowledge we have in possession, or can obtain from any source within our reach.

FOREIGN.

A Paris paper, which was received in London on the 6th of April informs that "letters from Missolonghi state that the advanced guard of the Greek army for the attack of Lepanto had marched, and been immediately followed by the division under Lord Byron." The plan of Mr. Barry, the engineer, for carrying Lepanto by storm had been approved, and little doubt was entertained of their ultimate success. The artillery corps of Constantinople would take the lead. It was stated at Missolonghi that Lord Strongford had nearly broken terms with the Sultan, on account of the insistent remonstrances of the Grand Vizier, for the loan raised in England for the Greeks. The troops under Lord Byron and Capt. Parry are provided with several pieces of cannon, each of which is commanded by a German or British officer.

It is said that no new journal can be published in France without the permission of Ministers. The *Philote* is the only evening liberal paper at Paris, and a person claiming the property of it has sold it to the government.

Private letters from Madrid state that a serious commotion had nearly arisen in that capital from the circular of the President of the Council of Castile to the Royalist volunteers having been read to them on the public parade. The volunteers loudly expressed their dissatisfaction, and were even proceeding to acts of outrage when the French Gen. Bourmont rode up, and threatened to call out his troops if they did not disperse quietly. This intimation had the desired effect.

The *Ichu* of Egypt imported from England near two years ago upwards of 100,000 stand of arms, with large supplies of ammunition. He has a fine cannon foundry, and powder factories. It is said he has long contemplated making himself independent.

DOMESTIC.

Meeting of the Legislature.—The Governor, Council and members of the two Houses assembled at the State House on the 26th inst. In the Senate the Hon. Nathaniel Beebe was chosen President, and Paul Willard, Esq. Clerk. John Farrie, jun. Esq. was re-appointed Assistant Clerk. In the House William C. Jarvis, Esq. was chosen Speaker, and Pelham W. Warren, Esq. Clerk. After the organization of the two Houses we proceeded in procession, together with his Excellency and the members of the Executive Council to the Old South Church, where a Sermon was preached by the Rev. Mr. Sharp. The procession was

again formed, and re-conducted to the State House by an escort, composed of the Independent Company, commanded by Col. Thomas C. Amory. The Speaker and Clerk of the House of Representatives were chosen by an unanimous vote, and all the officers of both Houses were elected almost unanimously.

Fire.—At New Rowley, Mass., on the 21st inst. the dwelling house of Capt. Isaac Knappe, together with his furniture, most of the clothing of the family, his tools, &c., were destroyed by fire. His pocket-book, containing near 300 dollars in money, and his papers were also consumed.

The work shop of Mr. Burrill, Wheelwright, in Roxbury, together with his tools and some stock was burned the evening of the same day.

At Baltimore about 10 o'clock of the 20th inst. the vessel, near the summit of the Shot Tower, took fire. Owing to the great height of the tower and the impossibility of reaching it with the fire apparatus, several of the upper platforms and a portion of the stairs were burnt before the fire was checked.

Mrs. Elizabeth Neill, daughter of Mr. Isaac Perkins, was thrown from her horse in Winchester, Virginia, and killed.

Stephen T. Soper, and Mr. Roloff Classen, both of Boston, were drowned in the harbor on the evening of the 24th inst. The accident happened in consequence of the upsetting of a small boat, in which five persons, two of whom were drowned.

The mail stage in coming out of Worcester on Monday, with 10 passengers, was accidentally overturned, broken to pieces, but no person was dangerously wounded.

Disappointed Lover.—A desponding suitor lately arrived himself in Canada, in consequence of a negative received from a lass, whom he vain would have married.

Spitting with Fire Arms.—A soldier in Richmond, Virginia, sport, took aim with a gun at the head of a non-commissioned soldier, without knowing or suspecting that his aim was loaded. The contents of the piece were discharged in the head of the man aimed at, and wounded him so that his recovery is doubtful.

A sail boat, with four persons on board, upset in a small Savannah harbor on the 15th inst. and all on board were drowned. Another sail boat out at the same time, with three persons on board is missing.

It is rumored in Canada, that the British ministry propose to form a Union of all the British Provinces in North America, and to place at their head a Royal Canadian Vice Roy. A Quebec paper says—"We do not know what a want of information may lead ministers to adopt. There is only one thing of which we are certain, viz.: that no change of the existing Constitution of the Canadas can be made, which will counterbalance the views of the promoters of these changes. The views of the promoters of these changes are satisfactory to the great majority of the people of both Provinces."

Curiosity.—We lately saw a curious specimen of industry in a miniature Malay Proa, with a crew on board, and every part of the rigging complete, the whole made of clothes so nicely strung together, that it was hard to be one mass. We understand that it is deposited in our Marine Museum, a present from the shipmaster of this town, commission merchant at Salem.

Our police officers have within a few days discovered a establishment for counterfeiting Bank notes, at Salem. Messrs. Hays and Homan proceeded on the present week, and secured two men, named Thomas Russell, and a Mr. Goldsboro, keeper of a house, who were all committed to prison in Connecticut, plates, &c. of the concern, were also seized. The original dies were all taken out, and a chemical process, and new ones stamped with the same identity. Among the counterfeiters found, were John Girard's Bank, Philadelphia—\$5's of the

Ontario Bank, both badly executed, and easily distinguished from the genuine; and \$3's of the New Brunswick Bank, the engraving of which is a perfect imitation of the true bills, and would hardly be distinguished by the nicest observer.—N. Y. *Merc.* *Adv.*

Villain Apprehended.—Sewall T. Mack, who was lately advertised for running away with the daughter of the lady, with whom he boarded, leaving his wife behind him, has been arrested, at Amsterdam, Montgomery Co. Maryland, and committed to prison. He married the girl he ran away with, and she has returned to her mother's family insane.

Frost.—On the night of the 25th a frost of considerable severity made an attack on this part of the country. In some places ice was formed one fourth of an inch thick. We have not learnt the nature and extent of the damage accruing in consequence of the intrusion of this unwelcome visitant.

CONGRESSIONAL.

In SENATE.—Friday, May 14. The Senate concurred in the amendments of the other House to the bill providing for the extinguishment of debts due for public lands. The bill for the survey of Charleston Harbor, and the Coast of Florida passed, and was sent to the other House.

Saturday, May 15, was occupied in attending to private bills.

Monday, May 17. Mr. Benton's resolution calling for information why canvases, cordage, and cables of American hemp were excluded from the Navy? was adopted.

Thirty three private bills from the other House were read a third time and adopted.

After a long debate a bill passed to appropriate \$12,000 to enable the President to send a military escort, when he shall think proper, for the protection of Commissioners to be sent to the Upper Missouri to treat with the Indians.

The Committees of Conference, which were appointed between the two Houses on the differences respecting the Tariff Bill reported that each House do recede in part from their respective votes, and their reports were agreed to. The bill was finished and sent to the President for his approval.

Wednesday, May 19. A "bill to improve the navigation of the Ohio, Mississippi, and Missouri rivers, by removing obstructions, &c. was discussed. Mr. Chandler moved to add the Kennebec and Penobscot rivers in Maine, in order to ascertain whether the advocates of internal improvements were disposed to distribute the advantages of these improvements in any degree of equality. The amendment, after debate, was rejected, and the bill passed to a third reading.—Yea 25, Nays 20.

The resolution of the House for the adjournment of the present session on the 27th inst. was concurred in by the Senate.

HOUSE.—Friday, May 14. The House, in Committee, considered certain resolutions offered some time since by Mr. Letcher, relating to decisions of the Supreme Court of the United States in cases which involve the validity of the Constitution of a State, &c.

Mr. Webster moved an amendment, and the resolutions and proposed amendments were debated at considerable length, but no decision obtained.

The Committee on Manufactures reported the Tariff Bill as amended by the Senate, and recommended the concurrence of the House with the following exceptions, viz.: 1. that which limits the duty on woolen goods below 33 cents to the square yard; and 2d that which imposes a duty of 25 per cent. on cotton bagging instead of five and half cents per square yard. This caused a sharp and desultory debate but no decision.

Saturday, May 15. The Tariff Bill was again discussed, and the amendments of the Senate were agreed to by the Committee, with a few exceptions, relative to Raven's Duck, Osmaburgs, Burlaps, and Ticklenburgs. The Committee disagreed to the amendment of the Senate relative to fixing the duty on woolen manufactures at 25 per cent. ad valorem, and on cotton bagging at 4 1-2 cents per square yard. The House concurred with the Senate in adding 15 per cent to the duty on foreign distilled spirits.

Monday, May 17. Among the petitions presented was one from a pauper, styling himself Louis Charles de Navarre, Dauphin of France, legitimate son of Louis 16th, praying aid to restore him to the Throne of France, &c. which was laid on the table.

Mr. Webster reported a bill for altering the time of session of the Supreme Court, which was ordered to a third reading.

The House by a small majority refused now to take the Beaumarchais claim into consideration.

Tuesday, May 18. No concerns of much general interest were attended to this day.

Wednesday, May 19. On motion of Mr. Vinton, the Committee on Commerce was instructed to report on the expediency of refusing licences to navigate boats, propelled by fire or steam on the principle of construction commonly called "high pressure." Allusions were made in the debate on this motion to the accidents which have occurred in consequence of using high pressure engines for propelling Steam Boats.

Thursday, May 20. The Post Office bill was again discussed, and more than 100 amendments proposed, and the bill eventually ordered to be engrossed.

The bill making an appropriation for Vice President Tompkins, &c. was discussed at much length. The sum fixed was \$115,000.—Yea 66, Nays 65. A motion was then made by Mr. Wickliffe to strike out the first section, but the House rose before any question on the subject was taken.

THE BACHELOR'S SOLILOQUY.

Or a new Puzzle in praise of Woman.*

Happy a man may pass his life
When freed from matrimonial chains
When he is govern'd by a wife
He's sure to suffer for his pains.
What tongue is able to declare
The failings which in women dwell
The worth that falls to woman's share
Can scarce be call'd perceptible.
In all the female race appear
Hypocrisy, deceit and pride
Truth—darling of a heart sincere,
In woman, never can reside.
They're always studying to employ
Their time in vanity and pride
Their leisure hours in social joy
To spend is what all women hate.
Destruction take the men I say
Who make of women their delight
Those who contempt to women pay
Keep prudence always in their sight.

ANN MARIA.

* When read for the praise of women, the first and third lines, then the second and fourth must be read.

Miscellany.

MAY.

A greater number of diseases are contracted, and there are more deaths in our climate during the three months of spring, than in any other season of the year. Epidemics seldom prevail to a great extent at this season, but diseases which are produced by the natural changes, and not the morbid constitution of the atmosphere, are exceedingly common. Few persons who have a predisposition to inflammatory affections of the throat or lungs, to asthma, rheumatism, or disorders of the skin, escape without an attack, unless they use constant precautions. The frost of winter produces a dryness in the air, which renders its coldness both salutary and agreeable;—but when, as in spring, the heat is just sufficient to dissolve the frost and set free the waters which had been locked up for many months, but not intense enough to heat the air, we have that combination of cold and moisture which checks the perspiration, confines within the system a vast quantity of matter which should have been evacuated by the pores of the skin, causes oppression of internal organs, and inflammatory affections of the mucous membranes.—All these are aggravated by the easterly winds, which are not only generally prevalent, but peculiarly disagreeable at this season; for before they reach us, they pass over a large tract of the ocean, and their solvent power upon the water is astonishingly great.

Thoroughly to avoid the ill effects of all these fruitless causes of disease, is we believe, impossible; but many of them may be escaped by carefully guarding against exposure. From the first of March to the first of June, in our climate, the clothing should be as warm as in midwinter, and it is particularly necessary that this circumstance should be mentioned at the present moment, since we are too apt to lay aside our winter garments before they can be dispensed with without danger to the health.

To adapt the dress with a scrupulous nicety to the fluctuations of temperature every day, would require a minuteness of attention which few persons could be persuaded to bestow; but every one may observe the general rule here given, and thus, with little trouble, be protected from the pernicious influence of sudden changes in the weather.—*Bos. Med. Intell.*

Disorders of Literary Men.—A man who is devoted to the cultivation of letters is too apt to forget that the soundness of his understanding depends much on the vigor of his bodily powers; he regards the application of the means necessary to preserve the latter, as a comparatively tiresome and forbidding employment, and dreams far more of the success he anticipates or the glory to which he aspires, than of the care he ought to bestow upon his health—the first and most desirable of all blessings, and that which alone can give a zest to the enjoyment of all others.

The sad effects of this error, which have been too often exemplified and lamented in our immediate neighborhood, have induced us to commence a series of letters of observations, the object of which will be to point out to our literary friends the manner in which their habits interfere with the natural operations of life and health, and the method by which their studies may be pursued without injury to their corporeal strength. With this end in view, we shall first give a general sketch of the manner in which the disorders of men of letters are induced, and afterwards a minute and physiological analysis of their causes, and the way in which they may be avoided. The execution of this plan will occupy a part of several successive numbers of our paper, and we shall attend to it with the more interest, since we are certain that no stronger motive than the conviction of the understanding can be offered to those who are not only the possessors, but the professed admirers of intellect.—*Ibid.*

The Ruling Passion.—Never was the ruling passion more displayed than by a poor Swiss, who was in the mad house of Zurich. He was rather afflicted by imbecility than madness, and was allowed his occasional liberty, which he never abused. All his happiness consisted in ringing the bells of the parish church; of this he was somehow deprived, and it plunged him into despair. At length he sought the governor, and said to him, "I am come, sir, to ask a favor of you. I used to ring the bells; it was the only thing in the world in which I could make myself useful, but they will not let me do it any longer.—Do me the pleasure then of cutting off my head; I cannot do it myself, or I would save you the trouble." Such an appeal produced his re-establishment in his former honors, and—he died ringing the bell.—*Nantucket Inquirer.*

The Count de Lauragais sent the following question to the faculty of physicians at Paris. "The gentlemen of the faculty are requested to give, in due form, their opinion upon all the possible causes of ennui on the human body, and to what point the health may be affected by it?" The faculty answered, that ennui might occasion obstructions to digestion, prevent the free circulation of the blood, create vapours, &c. and that, by continuance, it might even produce

marasmus and death. Furnished with this authentic document, M. de Lauragais hastened to a commissary, whom he compelled to receive his complaint; which was in substance, that he denounced the Prince de Henin as the murderer of Sophia Arnaud, (a favorite actress,) since for five whole months, he had never stirred from her side.—Grimm calls this a very new and original sally, from a little twist in the brain, doing no harm to any body.—*ibid.*

A certain senator had indulged a habit of shaking his head when any one was speaking in opposition to his sentiments. "Never mind it," says the speaker, though he shakes it, there's nothing in it."

A little Learning.—Pope the great poet observed that

"A little learning is a dangerous thing; 'ne but we believe a little is better than none, unless it be indeed a very little. But when a person has just a sufficient knowledge of letters to lead him to suppose that he can communicate his meaning on paper, when in fact he cannot spell a single word in the English language, what little he knows might as well be less. He knew that he knew nothing, his knowledge of his ignorance would be advantageous to him."

A certain Captain of a vessel, who intended to inform the owners of the ship and cargo that he was disappointed in the objects of his voyage wrote the following laconic but rather obscure epistle.

"Owen to the blockked of the poet my is spilt."

His meaning was, *Owing to the blockade of Port my voyage was spoilt.*—Communicated.

NEW GARDEN SEEDS.

JUST received by the London Packet, and for by GEO. MURDOCK, No. 14, Market-square, assortment of GARDEN SEED, of the last year's growth, among which are, Early and Late Cauldron Early and Late Cabbage, Early and Late Peas, Swiss Marjoram and Thyme, ARMACK, MANGEL WUELL, RUTA BAGA, &c. Likewise—a few cases MARASCHINO and CURACAO, a Cordial much celebrated in Europe—French Anniseet in baskets bottles each—Welch's No. 1 Chocolate, Cocoa Shells—green Madeira Citron. with other Groceries as usual.

Likewise—a few Hampers of Rich Cheshire and Cheddar—London Brown Stout, in whole and half tins—English and French Mustard, in kegs and jars. March 27. 6w

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for valuable IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The man in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO

March 27.

WANTED Nos. 14, 43, and 45, of the 1st Vol. of the N. E. Farmer. For which a generous payment will be given by the publisher of this paper.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but the subscriber who pays in advance, at the time of subscription, will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at discretion of the publisher,) until arrearages are paid.

NEW ENGLAND FARMER.

No. 45.

Correspondence.

OLOGICAL AND AGRICULTURAL SURVEYS.
(The Editor of the New-England Farmer,

Sir,—In some parts of the state of New-York, geological and agricultural surveys have already been taken, which promise much usefulness to the farmer, as well as to the naturalist. As the soils are formed by the disintegration of rocks, it seems necessary that the cultivator should become acquainted, at least, with the rocks in his own neighborhood before he can have a competent knowledge of his own soil. The rocks are such as form a meagre, unfruitful soil, some different kinds of earth should be sought to render it more favorable to vegetation, by giving it those qualities best fitted to ensure to plants the virtues of common manures.

It is said by some of our best writers on agriculture, that in some places, means for enriching the soil are to be found in the subsoil; while in others, the subsoil, on being mixed with the soil, operates unfavorably. Now it seems plain, that if the properties of the different kinds of earth were well understood, and the necessary proportions to form the best soil, under all circumstances, a more correct system of manuring and improving lands, might take the place of the present practice which has neither system nor method about it. Let some encouragement be offered to the aid of scientific as well as practical agriculture, by our societies, and those who are destined to fulfil the duties of the husbandman, will be induced to acquire some knowledge of those sciences immediately connected with their profession.

Let the farmer have some knowledge of natural history, and he will make as good use of the man in any other profession: its application comes directly to his every day labor. Let the principles of chemistry and geology be brought to practical use, and we shall at once see beneficial results:—More judicious practices might be adopted in making composts: different kinds of earth might be collected for the manure heap, and applied with success and profit; while at present, their usefulness is entirely unknown to the practical farmer: to him they are like a talent buried in the earth, though it may be common in his own neighborhood, and on his own farm. As he cannot bring his soil to the test, and thereby detect those particular qualities which have an unfavorable effect on vegetation, he has therefore no means of finding the 'better way' to correct them, and to them value.

Agricultural theories can never admit of demonstration without the help of science. To be able to trace the effect to the cause, in common occurrences, and to reason correctly on results is a grand desideratum in agriculture. We cannot yet arrive at the summit, although it is daily granted that many improvements have, of late, been made among the common farmers. In the introduction of agricultural societies in this state, many have studied the art of neatness in the management of their fields, and used their exertions in saving and increasing the

manure of their stables and hog-sties:—but thousands are yet imagining that nothing, save the productions of their barn-yards, and animal and vegetable substances in a state of decomposition can claim the appellation of manure. Much is yet to be accomplished. Many rude customs, and opinions founded on error, must be brought to the dust;—science must be called to assist us in our fields, and among our manure heaps, ere we can substitute in the place of husbandmen, the more desirable name of agriculturists. B.

Hampshire County, May 20, 1824.

LICE ON APPLE TREES.

To the Editor of the New-England Farmer,

Sir,—In your paper of May 29, is a communication respecting lice on apple trees, but no remedy prescribed.

The subject is important—none more so with the farmer, who calculates on an orchard—the most prominent item in agriculture.

It is not many years since these lice were noticed,—since which time they have increased beyond calculation;—though the caterpillar, not half so destructive to apple trees, has called our attention from the first settlement of our country—so that tarring the trees and putting sods or sea weed in the crotches of the trees is as regularly attended to as ploughing the field in the season thereof; the sods can do no injury to the trees, but as to the tar, it is doubted whether the remedy is not as bad as the disease. For years past I have minutely examined those lice, and remarked the progress they are making, with all our care to suppress them. I have found that each of those shells contain say about 40 or 50 nits, which about the first week in June come out and produce their kind, who move about the limbs (the product of the year before mostly) for about 10 days, and finally produce, in the course of the year, other shells, which we erroneously call lice.

The most effectual mode that I have found, by experience and attention, is the bathing or washing of the tree for the first ten days in June annually, with some liquid composition—such as soap suds, or in water with some salt, ashes, lime, urine, &c. &c. ETANIS.

May 31, 1824.

REMARKS.—Our correspondent, perhaps, overlooked our observations on Mr. Carr's communication on the subject of lice on trees, published in our last paper, page 350, or he would not have told us that "no remedy is prescribed" for the disorder in question.—Since writing that article, we have obtained further information on the subject, which we are happy to place before our readers. The Massachusetts Agricultural Repository, vol. 3, page 144, contains the following letter from E. Perley, Esq.

"This insect, called *lice*, is in form like half a kernel of rye, (but not more than one twentieth part so large,) with the flat side sticking to the smooth bark of the tree. They resemble blisters; and are near the color of the bark of the tree. These blisters contain from 10 to 30 nits or eggs each, in form like a snake's egg; (which, in a common season, begin to hatch about the 25th of May, and finish about the 10th of June,

These nits produce a white animalcule, resembling a louse, so small they are hardly perceptible by the naked eye; which, immediately after they are hatched, open the passage at the end of the blister, and crawl out on the bark of the tree; and there remain, with but little motion about ten days; when they stick themselves fast to the bark of the tree, and die. From this little carcass arises a small speck of blue mould, which is most plain to be seen between the 10th and 20th of June, and continues about fifteen days; and then gradually wears off, until the old carcass appears, which by this time is formed into a new blister, and contains the spawns or nits before mentioned.

"These blisters prevent the circulation of sap, and prove as fatal to the tree as the cancer worm.

"In order to remedy the difficulty, I have made many experiments within a few years;—but long to no good effect, not knowing then the particular season when these animalcules could be most easily destroyed. This, however, I have lately found to be between the time they hatch, and that when the mould leaves them.* The application that I have found most effectual, is washing the trees with lie or brine. Lime, also, mixed with lye, to the consistence of white wash, may be useful. And although the small branches cannot be cleansed in this manner without much difficulty, still, if the body of the tree, and the branches near the body are kept clean until there comes a rough bark, I think the lice will not kill the tree.

"Some people have recommended the application of train oil to the tree, which, indeed, is a powerful antidote against lice, but being of a glutinous quality, is very detrimental to the tree. Inoculation has been proposed; which, I think, will have no effect at all on the lice; for I perceive they hatch in May, on branches that were pruned off the tree in March, and the sap entirely extinguished.

"These lice are natural in the uncultivated forest, on what is called moose-wood, and other bushes.

"Much care should be taken on their first appearing in an orchard or nursery; as the cutting down and destroying a few young trees is of no importance, compared with the difficulty of having an orchard overrun with them.

"P. S. The brine or pickle, with which the tree is to be washed, should not be such as has had meat salted in it; but let one quart of common salt be dissolved in two gallons of clean water.

* "It appears from this account, by Mr. Perley, that these appearances can, in general, only occur between May 25, and July 5."

The following communication was copied, and sent to us by a friend, to whom we have heretofore been indebted, for similar favors. The remedy proposed is simple, and comes recommended by high authority.

ROT IN SHEEP.

Though there is some doubt among physiologists whether the *pasciola* or *fluke worm* be the cause or effect of this disease, all are agreed that the malady never appears in a wholesome

atmosphere, and a strong and vigorous state of health; and it has of late been sufficiently ascertained that tonic stimulants, and especially the stimulant property of sea-salt, whether mixed with the food mechanically or chemically, as in salt marshes, is the best and most effectual mode of cure. The food of Merinos, in Spain, is therefore constantly enriched with salt; and Lord Somerville justly attributes the health of his flock of upwards of two hundred merinos, which he purchased in Spain, to the use which he has for many years made of this article on his farm. A ton of salt is the proportion employed annually for every hundred sheep.

[See Good's System of Medicine.

SAMUEL PARKES, an eminent Chemist of London, member of many learned and Philosophical Societies, including the *Massachusetts Agricultural Society*, has presented to the Institution, last mentioned, a very valuable work, entitled "*Chemical Essays, principally relating to the Arts and Manufactures of the British Dominions*." This work is interesting and amusing as well as useful. It contains a compendious view of the latest and most important discoveries in the arts which more particularly minister to the necessities, comforts and conveniences of mankind; and embraces almost every topic, which gives to civilized man a superiority over the savage, who depends solely on the chase, and the chance productions of the waters and the wilderness for a precarious and miserable subsistence.

Although this work is not particularly devoted to agriculture, it embraces many articles, of importance to the cultivator, and therefore coming directly within the plan of our publication. Besides, the arts are all near relations, and whatever is of use to any one will prove auxiliary to all. We have, therefore, made the following quotations from the "*Chemical Essays*" which we cannot but believe will prove acceptable to our readers.

MANUFACTURE OF STEEL BY THE ANCIENTS.—The ancients, it is believed, had some peculiar method of making steel. This suspicion is grounded on the hardness of some of their statues, as well as on the nature of the Egyptian obelisks, which are carved with a variety of figures, and yet are made out of porphyry, which resists the tools of modern times. Dr. Lister (in a paper read before the Royal Society) complains that this valuable secret is now lost. According to Aristotle and Pliny, the ancient steel was made by keeping forged iron for a certain time in melted cast iron.

RANCID TALLOW, OR TALLOW CONTAINING WHAT CHEMISTS CALL THE STERIC ACID, HOW PURIFIED.—Old tallows may in general be sufficiently purified from their rancidity by melting them upon lime water, and giving a considerable agitation to the whole mixture; for when the water is again suffered to subside, it will be found to be offensive in smell, and to have subtracted most of the impurities of the tallow. Should the tallow, however, be found not to be sufficiently purified, a repetition, of the process would completely effect it.

An ingenious friend assures me, from his own experience, that if new rum be exposed for a night to a severe frost, and then removed to a heated room, and thus alternately for a week or two, it will in a short time have acquired a flavor equal to old spirits.

RAYS OF THE SUN, CLIMATE, &c.—The sun's rays appear to have no power of giving heat unless they impinge against a solid body. The focus of the most powerful burning glass, if directed on mere air, does not produce the smallest degree of heat. Thus Mons. Charles the aeronaut, found the air in the neighborhood of Paris to be 47°; and when he had ascended to the height of eleven thousand feet, only 21° or 11° below the freezing point. It has sometimes been imagined that difference in the climate is occasioned solely by the relative situation of the different countries with respect to the sun; but nothing can be more erroneous, as appears from the state of the Andes, which may be adduced as a complete refutation of the idea; for between the base and the summit of the mountains every degree of temperature may be found. The city of Quito, situated about the middle of one of these, experiences a mild and temperate climate, while the sands beneath it are intensely hot and the ground above it covered with perpetual snow.

The country on the borders of the Albany River, in the southern parts of Labrador, are in the same latitude with Great Britain; and yet the cold is so severe, and the snow so perpetually on the ground, that the lands be entirely uncultivated. The climate of Newfoundland which is situated still further south is more like that of the north of Russia than England. Dr. Robertson supposes that the difference of temperature between certain parts of Europe and similar latitudes in America is equal to twelve degrees, and that a place thirty degrees from the equator in the latter, is as warm as those which are situated at eighteen degrees from it in the former.

ECONOMY OF FUEL.—In manufactories where large and expensive iron boilers are employed, coals impregnated with sulphur should be avoided; as the sulphur, which rises during combustion is apt to occasion a rapid decay of that part of the boiler which is exposed to the action of the fire. It produces sulphuret of iron which wastes away as fast as it is formed. This is more particularly the case with those cast iron stills, which are required to be red-hot, such as the pots in which the makers of Prussian blue dux a mixture of animal hoofs and horns with a caustic fixed alkali.

Count Rumford has stated that, in general, not less than seven eighths of the heat generated, or which with proper management might be generated from the fuel actually consumed is carried up into the atmosphere with the smoke, and totally lost. How important then is it that every proprietor of a manufactory should investigate the causes of this loss, and endeavor to remove them!

Where the boilers are set in brick-work over closed fire places, the most common defect is that of having the fire-places too large. This often arises from the obstinacy of an unskilful brick layer. It is a great want of economy to employ inferior workmen to erect any kind of fire-works. Whatever may be the expense I have always found an advantage in having furnaces well built in the first instance. The consequence of having the fire place too large is, that the bars cannot be entirely covered with fuel, and the cold air rushing from the ash pit between the uncovered bars, actually counteracts

the effect of a great part of the burning fuel. In setting stills or boilers, it should be a general rule to have the fire places no larger than is absolutely necessary for containing as much fuel as will be required to produce the intended purpose.

The fire place should not only be small, but it should be constructed so that the whole of the bottom of the boiler be exposed to the action of the burning fuel. The heat which is applied at the bottom of the boiler will be infinitely more effective than the same portion of heat, when applied to its sides. It is on this account that some large stills and other vessels of copper are made with the bottom to project inwards presenting a concave instead of a convex surface to the action of the fire.

These considerations explain why there is so great a waste of fuel whenever pots or other vessels are heated over an open fire place; for in this case, the heat only skims over the bottom, and passes off immediately into the surrounding atmosphere.

The doors of closed fire-places are also as improper as the fire places themselves. They are usually made extremely thin, and the frames very light; which not only occasion them soon to wear out, but is the cause of their warping and twisting. These doors are also made to fall into a rabbet, and are fitted up with latches both of which are inconvenient, and indeed useless.

Having had many years experience in fitting up furnaces, I am decidedly of opinion that where cast iron doors are employed, an opening of ten inches should have a door not less than three quarters of an inch thick; and larger fire places should have thicker doors in proportion. These should be fitted up with strong wrought-iron hinges, such as will allow the doors to fall flat against the frames; and instead of moveable latches, each door should have a large projecting knob firmly riveted to it.

I have found it advantageous to have the straps of the hinges thick, and of such a length as to extend entirely across the door; for when these are well riveted to the door, they prevent the latter from warping, however intense may be the fire.

The cast iron frames ought to be as thick as least as the doors; and they should be two or three inches broad, to enable them to stand steadily against the walls of the furnace. In setting the frames, they should be fixed inclining a little towards the fire place: this gives the doors a tendency to keep shut, and renders latches useless. Bars of wrought iron, when fastened, should also go, one from each corner in a spreading direction, not less than eighteen inches or two feet into the solid mass of brick work in which the boiler is to stand.

There is a benefit arising from having these straps long and substantial, which may not at first be apparent. They prevent the frame from receding from the brick work, the consequence of which would be that air would pass into the fire place between the frame and the masonry, and thus impair the draught of the furnace.

It is also of importance in every close fire place, to have a door to the ash pit; one that

shuts easily and fits close to the frame on which it hangs; for without this it is impossible ever to regulate a fire so as to reap every advantage from its effects.

Having experienced the benefit of ash-pit doors, I have for several years been in the practice of having my fire-places fitted up with double doors and frames; that is, I have a strong iron frame cast, with two openings; to one a door is hung for the fire place, and to the lower opening I adapt another for the ash-pit.—The peculiar advantage of this is, that a double frame of this sort is most easily fixed, and can be attached more firmly to the brick work, than it would be possible to fix two frames, one immediately above the other.

These doors and frames are expensive at first, because they are weighty; but in the end they will be found to be more economical than my ready-made sale-doors that can be found.

Besides, since I have had these doors to the ash-pits I have dispensed with the registers in the chimneys; for I find that by a proper attention to the opening and shutting of the ash-pit door, I can admit any portion of atmospheric air into the fireplace, and thus have a complete command of the temperature and its application.

For some time I had registers in the chimney, as well as doors to the ash-pits; but finding that both were more than servants would attend to, I have now discarded the former altogether, and perceive that every effect that can be desired may be produced by the ash-pit doors alone. However deep the ash-pits may be, it is always advisable to have doors to them. Some scientific men in the metropolis have had doors three feet in height to the ash-pits of their rewiring coopers, and have found them very economical.

I have sometimes had moveable registers in the centre of the ash-pit doors; these are too troublesome to be managed by ordinary servants; and a common plain ash-pit door, when properly hung, may be readily opened an inch, or more, or entirely shut, according to the advice of the laboratory-man employed.

From the Boston Daily Advertiser.

THE SEASON.

Roxbury, May 20, 1824.—In some remarks which I sent you early in this month, I observed that the season was unusually forward, and the promise of fertility in fruit, grain, and grass, abundant. Knowing however the great precariousness of our climate, and the hazards attending early seasons, which I have uniformly dreaded, I added, that late frosts and cold winds might still blight our fair hopes. It certainly was not intended to be prophetic, but it was the result of my fears—and the event has realized them. On the 6th of May we had a killing frost; the extent of the injury cannot be ascertained at this moment. How far it may have affected the cherry and peach blossoms cannot yet be known. The quantity of blossoms on both these sorts of fruit was unusually small, and it may be safely affirmed, that the peach trees have rarely suffered more severely than during the last winter. If we may venture to suggest a radical remedy, not indeed effecting the present season, (for the evils affecting that are remediable, in a great degree,) but in regard

to the health of peach trees in future years, it would be the expediency of very bold pruning and shortening of the branches. We have been generally deficient in this respect. In all other countries, the peach is much more severely pruned. Its growth is rapid—it bears pruning as much as the willow; and the practice of permitting it to grow, till there is only a small tuft of live wood at the top, cannot be too much condemned.

The frost of May 6th of course operated more severely in some places than in others. I will state its general effects.

It killed all the shoots of asparagus above ground—early potatoes and squashes—it injured cabbage plants, and put them back at least fourteen days—it killed the shoots of the butternut trees so as to destroy the fruit—of course it injured all other tender shoots and plants. It is said that one gardener who supplies the market estimated his loss at six hundred dollars, but this may be exaggerated. Potatoes and early corn recover by new shoots, and as the effect was very general, and all suffered alike, the chief consequence will be, that vegetables will come to market a little later. Still the loss to early gardens, and active, intelligent men, is great, because the late sown seeds will overtake those early sown, and the special rewards of superior industry and enterprise will thus be lost.

The comparison of this season with the few past seasons will now stand as follows.

The cherry opened its first blossoms,

In 1817, May 6th—1818, May 17th,
1819, May 6th—1820, May 2d,
1821, May 9th—1822, May 1st,
1823, May 7th—1824, May 1st,

The pear opened its first blossoms,

In 1817, May 7th—1818, May 24th,
1819, May 17th—1820, May 9th,
1821, May 13th—1822, May 5th,
1823, May 13th—1824, May 4th,

Asparagus first cut,

In 1820, May 1st—1821, May 9th,
1822, May 1st—1823, May 5th,
1824, April 28th.

Apples first opened their flowers,

In 1820, May 10th—1821, May 13th,
1822, May 9th—1823, May 19th,
1824, May 10th.

On the whole, therefore, the season, though unusually early at the opening of it, has been retarded, and the apple trees are not at this day, the 20th May, more generally open, than in rather later seasons.

The prospect of grass crops is certainly uncommonly good, and that of apples rather more than an average, though not equal to the summer of 1822. The verdure has not been in any degree affected by the frosts, and it would seem to be too late to apprehend injury from droughts. The great complaint seems to be of a superabundant moisture, and a deficiency of heat.

A FARMER.

Roxbury, May 28, 1824.

MR. HALE.—The Frost on Wednesday morning last was not so severe as that on the 6th instant. It did not affect the shoots of perfect trees, or stiffen the soil—but it was far more extensively injurious to market gardeners.

It very generally killed squashes, cucumbers and melon vines—potatoes, a second time—early corn and beans. It is difficult to calculate the extent of the loss, but it must have been

considerable to those who supply the Boston market, and must enhance the price of all the articles which are sent early to market.

Frosts were not affected—but the very cold weather of the last ten days will retard them very much. There is great danger that cherries will fall unripe—and some hazard, that the pears will suffer. I have no fears about the apples, unless this severe weather should continue. It is to be hoped that the country at large will not suffer, as the distant farmers plant later than we do. Those will be the most fortunate, who planted latest. A FARMER.

It is very hard upon our enterprising market farmers who have been nearly three months employed with their hot beds in bringing forward early vegetables, to see the whole cut off in a few hours.

Graphic Kaleidoscope.—An invention of great importance in the arts, and particularly in bank note engraving, has lately been perfected by Mr. William J. Stone, of Washington, by which an endless variety of figures can be produced, in a manner that we believe to be imitable. We cannot give the reader a better idea of the peculiar powers of this machine, than to compare it to a Kaleidoscope, forming combinations of the most beautiful figures that can be imagined.—They are formed of one continued line, crossing and entangling themselves in the richest variety.

This apparatus is composed of two cylinders, on the surface of which levers are attached, with moveable fulcrums, and, as the cylinders pass and repass each other, they shift the fulcrums in the evolutions, which give motion to another lever of singular construction, and to which a chisel is attached for cutting the figure. Nothing that we are acquainted with, in the whole circle of the arts, presents such a formidable obstacle to forgery; and we are assured, by the inventor himself, that no two machines of this description can ever produce the same work.

Here, then, it is probable, is the desideratum so long sought for by the Bank of England, and for which so tempting a premium has been offered. The inventor, we are told, is so confident of the utility of his discovery, that he intends to repair to London, for the purpose of submitting it for inspection in that metropolis. [Wash. Gaz.]

A beautiful Arabian.—Lt. Parker of the United States Navy, who arrived a few days since in the Constitution, brought with him from the Mediterranean a full-blooded Arabian colt, which he obtained at Tripoli, as a present for Gen. Bogardus, of this city. He is the handsomest animal of the kind we have ever seen—age 22 months—14 hands high—proportions perfect—body a mouse colour—legs black—star in his forehead, hair soft and glossy as silk—hoofs small and semi-transparent. He is extremely docile and playful, the sailors having taught him on his passage to shake hands with them. Immediately after he was landed at Brooklyn, a gentleman offered \$500 for him, which was of course refused, as he was intended as a present. A filly of the same description is on her passage, and the two will doubtless be of use in improving the breed of our horses.—N. Y. Statesman.

The following No. on the subject of Straw Bonnets, should have preceded the last No. on the same subject, published in page 348 of the present volume of the *New England Farmer*.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.
No. VI.

I have already noticed the contradiction of the actual fact of the assertion in the Salem Merchants' Memorial, that "the European powers were relaxing their restrictions on Commerce." Dr. Cooper, in his late pamphlet against the tariff, applies a similar remark, particularly to the ministry and parliament of England. It is somewhat singular, that a man who has been so often before the public of England and the United States, as a controversial writer, should risque a position which he knew to be fallacious, and thus furnish his opponents with an argument against the cause he defends.

So far from the assertion of Dr. Cooper being true, that not only the ministry, parliament, but private men and societies are unceasingly upon the look out for occasions to alter the existing duties upon foreign articles, which can in the least possible way affect the home industry of their fellow subjects. They seldom require an existing duty lowered, but often ask to have it increased, or for a new one to be imposed upon an article, before free. The board of trade are particularly charged with this important and truly patriotic duty, and they attend to it with a zeal and vigilance, that do them the highest honor. No sooner do they find out an article requiring an increase of duty, than a law is brought forward by the minister to do what they deemed necessary;—and parliament, relying upon their judgment, seldom fail to pass it. The *United States ought to have such a board*, in place of leaving the business to the Secretary of the Treasury, who cannot have time to attend to it, and moreover may be incompetent to the task, or fearful of doing what may make him unpopular, and affect his pretensions to the presidential chair.

The last British tariff of 1819, shows a determination to pursue their restrictive system to the former full extent; none of the old duties are taken off, but many additions are made, and that there might be no possibility of missing revenue from any thing brought to England, that nothing might escape, it is ordained that all the articles not particularly mentioned, shall pay a duty of fifty per cent—even eggs pay a duty.* Can any thing be more plain, or decisive of the opposition of the fact, to the position of the Salem memorial, and of Dr. Cooper?

* From a late English paper.

Foreign Eggs.—The following is an account of the number of foreign eggs imported into Great Britain in the year ending the 5th of January, 1823, (at a duty of 10d. per 120,) distinguishing the countries from which the same were imported, with the amount of duty received thereon:—

Denmark	-	-	-	240
Holland	-	-	-	120
Flanders	-	-	-	949,263
France	-	-	-	49,425,124
Guernsey and Jersey	-	-	-	269,278
Total quantity imported				50,644,025

Amount of Duty received 117,567 36s.

per? Do we not see that even since the publication of the last British tariff they have laid in 1822, a new duty upon Leghorn hats of \$13.33 per doz. another of \$3.07, on plat not made up, and even a duty of five per cent. ad valorem, upon IMPORTED STRAW? To talk of our relaxing commercial restrictions after these facts is an insult to common sense.

It is unnecessary to quote instances of similar conduct in other European powers, to prove what is here asserted, as Mr. Carey has quoted several of them in his numerous and useful publications, to which I refer all those who doubt the fact, or wish to be informed on the subject.

The British nation it is acknowledged cannot cultivate grain as cheaply as the people of the Continent, and hence the landed interest in England, after the late war, were clamorous to Parliament for a protecting duty on foreign grain, equal to the burdens borne by the grower of corn in England. Accordingly an act was passed to prohibit the importation of wheat, barley, rye, or oats, until they reached certain prices at home. The maximum price for wheat was fixed at 80s. for the quarter of eight bushels, and when it rose to that, the ports were to be opened to foreign wheat, upon a duty being paid. Some of their political economists have contended for the unrestrained freedom of the corn trade: but every attempt made by them in Parliament to effect that object has failed. No longer since than the 26th of February 1823, Mr. Whitmore moved for leave to bring in a bill only to amend the corn laws, and was powerfully supported by the late Mr. Ricardo, a man of the greatest weight in the house on such subjects, but they could not succeed. The object was to lower the present limits at which the exportation of grain could take place, from 70s. to 60s. and to repeal the duty upon its importation. Ministers and the farmers do not wish the subject legislated upon, for fear of the movement ending in giving encouragement to the free introduction of foreign grain at low prices; and yet in the face of such uniform conduct, we hear of fine speeches from ministers and their adherents in Parliament, and at public dinners, in favor of "the great principles of commercial freedom," and against "restrictions, and about reciprocity in trade," &c. &c. and we find their writers supporting the same sentiments. It is easy to talk and write thus, but as their actions contradict their professions, we must expose their insincerity. The expression is not very dignified to say that the *British are endeavoring by such language to throw snuff in the eyes of the people of the rest of the world*, to blind them, but the idea conveyed by it applies so forcibly that it cannot be withheld. The merchants of Salem and Dr. Cooper are willing to believe the British sincere on the subject, for they quote what the British say, as an argument against Congress protecting home industry by increased duties on certain imported articles. Now, the case applies forcibly to the United States. England as regards the cultivation of grain is precisely in the same situation with the continent, that the U. States are as to herself in the business of manufactures. The greater cheapness of labor and living and their wider field for agriculture, enables the people on the continent to undersell the British; they are therefore prevented from

bringing grain to England, until she is all but starving. England by her greater experience, comparative cheapness of manufacturing labour, arising from the use of machinery, low wages, and the poor diet of the workmen, and above all, from the inferior East India cotton used, and the flimsy texture of the stuffs made from it, and from wool,* are enabled to undersell the Americans, who have not all yet gotten the improved machinery, and make strong stuffs from good cotton; and eat butter and meat twice or three times a day, instead of once a week or once a month, in place of a daily diet of water porridge, sowens, flummery, or potatoes; and although American workmen are contented with very small profits, yet the great importance of the command of cash to the British manufacturer, induces him to sell his goods in America for what he can obtain. Hence the manufacturers in the United States, require the same protection in the way of duties, to enable them to compete with Britain, that England does for her agriculture against the cheaper cultivation of the continent. Unfortunately many of our legislators think otherwise, and from an ungrounded apprehension that foreign commerce will be ruined, oppose any alteration in the present tariff, the absurdity and inconsistency of which have been amply detailed by Mr. Carey. We eagerly copy the follies and fashions of England and France, but carefully avoid the sound sense they often exhibit, and most conspicuously on the present subject. We hope however for a change in sentiment, and to see the day, when domestic industry will be duly protected. It is not for the United States to see the example of this commercial freedom, about which the people of England talk. Let the governments of Europe take off their restrictions, and we will not object to do the same, but absolute ruin would attend the unlimited entry of foreign goods without duty, nor can we be said to be upon a fair footing with them as respects protection to manufactures until our workmen are enabled to keep out certain foreign goods. A nation without a tariff, would have no more chance of existence, among the nations of the world, than a bank would have in preserving its solvency, that redeemed its bills with gold or silver, while all other banks in the same city or country with it, were permitted to suspend their cash payments. The position applies with proportional force to a nation, the domestic industry of which is only partially protected, or to a bank paying part in cash. The prosperity of both will be restrained in a direct ratio to the unequal footing in which they are placed, with respect to other nations and banks. This is an aphorism in political economy supported by the experience of ages.

* To make up for the actually flimsy texture of the cotton and woollen clothes, made in England for sale at auction in the United States they are thickened with flour of wheat and starch. The cotton fabrics go to pieces after a few washings.

A Mernaid.—Mr. S. Dodge, New-York, passenger in the fish Otter, arrived at this port yesterday from Manila, has in his possession a mernaid brought from the coast of Japan. Persons who have seen this new comer, say that its appearance corresponds with the description given of this fish and flesh in fabulous history.—*Patriot*.

AGRICULTURE OF NOVA SCOTIA.

By the courtesy of John Young, Esq. Secretary of the Provincial Agricultural Society of Nova Scotia, we have received several copies of a pamphlet, containing an abstract of the proceedings which occurred at a late meeting of said Society. By this it appears that agriculture is thriving in that Province, to a degree, which has surpassed the anticipations of the most sanguine. It is likewise apparent that a zeal in the great cause, and primal source of national power, as well as individual prosperity, which has already produced and still promises the most beneficial effects, pervades all ranks of the community in that Province.

"At one o'clock," according to the pamphlet, "on Saturday, the 14th of February, the House of Assembly adjourned, as preparatory to the meeting of the Provincial Agricultural Society at the same hour and place. The Members of his Majesty's Council instantly attended; and the seats were speedily occupied and filled up by gentlemen in town, who are private subscribers to the Institution. "The Hon. Marshal Wallace, as Vice President, took the Chair, and called attention to the Annual Report which was now to be read by the Secretary.

This Report is written with that ability, which might have been expected to mark the production of the author of the "Letters of Agricola." We shall quote a considerable part of it, omitting such passages only, as from their local or particular application may not prove of so interesting a nature to our readers as to those to whom the observations were originally addressed.

"After any machine whatever is set up, and promises to answer the end for its erection, he must be a daring speculator who would recommend to break it down on account of any defect or irregularity of its motions. The skilful artist would try simply—to lessen the friction of the wheels,—to rectify what he perceived to be wrong—to introduce a greater harmony into the disposition of the parts—and even when he met with faults that were irreparable, patiently to submit, rather than adventure any rash and hazardous experiment which would endanger its safety. If this be true in mechanics, it is more so in any of those institutions which, for useful and special purposes, have been founded and established in society. Hence correction and reform in such is a better and wiser remedy than innovation; for in the latter, violence is done to the feelings and habits of mankind, while the former operates a change slowly, imperceptibly, and without giving any undue shock to existing prepossessions and modes of thinking.

"Our agricultural institutions may now be considered as pieces of machinery essentially connected with our internal policy, and which are pretty generally contemplated as the means by which our independence in bread corn is ultimately to be wrought out. To this one object as of pre-eminent importance they have hitherto been directed, and without any material marked departure from it. The different schemes of encouragement have been amended, enlarged, or more or less modified every successive year, but still the first great original outline has been preserved inviolate and unaltered. The culture of grain has been promoted in all the different societies, and green crops have been regarded, not as being very important themselves, but as subservient to the success of the other. When Lime and Summer-

fallow were admitted among the objects of competition, it was by reason of their subserviency to the great main end; and in accordance with the same view composting and draining are proposed to be added in that scheme which has been submitted by the Directors to the Legislature. No suggestions, from what quarter soever they came, have been rejected, which offered to extend or improve the cultivation of white crops: this steady and unbending perseverance in the prosecution of one object has been crowned with the most unexampled good fortune. In confirmation of this there is no need of appealing to any doubtful authority, as you all are in possession of the official letters which were written by the local societies in December and January last, in answer to a Circular despatched by order of the Board for the very purpose of drawing out and bringing together this information. If we suffer ourselves to be influenced by this cloud of witnesses, and surely no evidence can be more unbiassed, more particular, or less suspicious, our path of duty is clear and beset with no sort of difficulty. We have nothing more to do than uphold the present system of raising bread corn throughout the different associations, and that on one recognised general plan, which will always command obedience while sanctioned by the Provincial Government. For the four last years this has been the uniform and undeviating policy pursued, and the success attending it has gone beyond the most ardent anticipations. The goal is now within sight, to which our wishes, our desires, our exertions have been pointed;—and it is only necessary in order to carry the prize, to avoid starting from the course, or lagging behind through a careless or blameable indifference. These letters from the societies which have just been printed and circulated among all the members, whether honorary or ordinary, contain a body of evidence which must force conviction on every unprejudiced mind, and show that, by supporting them a little longer, the independence of this country will be no longer matter of theory or pure speculation.

The writer then exhibits a table, which contains "*A Comparative View of the Imports for four years as illustrative of the progress of Provincial Husbandry.*" By this and other documents it appears that the savings for the last five years in consequence of increased attention to agriculture, in the articles of flour and Indian corn alone, had amounted in value to £122,610.—The amount of public money, granted by the Legislature of the Province, for the purpose of improving agriculture is 5550*l.* of which 4690*l.* had been expended. It appears, likewise, that the farmers of Nova Scotia, in consequence of the agricultural spirit thus excited, "have been transporting across the Bay of Fundy, very large supplies for the sister Province."

Mr. Young then continues his observations as follows:

"Further, there is a collateral advantage which ought not to be overlooked in the stating of this argument. In order to produce the additional quantity of bread corn which has been done away with the necessity of our former large importations, much land has been cleared up and brought under the plough. In the whole compass of political science, there is no position more capable of a clear demonstration, than that every acre of ground, improved for the growth of grain, is in itself, an accession to

the national wealth; and that in proportion as the territory of any country becomes arable, it will abound, as a natural consequence, with a greater multitude of buildings, with a better fed and more valuable stock of cattle, and with all the means of a profitable and growing commerce. If the additional value, therefore, which has been given to the landed interest, be summed up along with the prodigious savings in foreign imports throughout all the harbors and bays of Nova Scotia, we shall then be able to make a nearer estimate of the actual good, which has accrued from the expenditure of the 4690*l.* distributed among the societies.

"That such mighty effects should have sprung from so trivial a cause looks so strange and problematical, as to have formed a very plausible excuse for some men, to seek for other hypotheses, by which to account for the appearance. It is not my province in this annual Report, and standing in this place, to argue with such as are disposed to take this view of the subject. Allowing to them every possible concession which they may please to demand—from the necessity of the times—from the poverty of the people which urges them to greater exertion and to a cheaper and plainer food, still there is a curious problem, connected with their theory, which is not easy of solution. It is this: why have not the same poverty and the same necessity produced like effects in his Majesty's other possessions in North America? Whence comes it, for instance, that New Brunswick still needs such large and regular supplies; or that Nova Scotia is now able to spare them? Why has not the agriculture of Upper and Lower Canada made so great a start forward as our own, and what has kept the flame, which has been here kindled and has burned so intensely, from spreading all around? Those other colonies have been placed exactly in our circumstances—their trade has equally suffered—their property declined in value—their circulating medium drained to the United States—and yet we see not among them the same excitement by which our husbandry has been distinguished. It will turn out in balancing on both sides the probabilities of the question, that our progress must be traced to the peculiar causes here operating, and which are,—the fostering care of the Legislature—the regular system of encouragement for raising bread corn—and the existence and spread of the agricultural societies. At all events, we know that these institutions and the commencement of our progress were concomitant events; and if the one were not the cause of the other, they were so closely connected in point of time, and are by so many now believed to be connected in point of efficiency, that it would be extremely hazardous to disunite them.

(To be continued.)

Price of race horses.—A late London paper states that the price of "first rate" colts has averaged about two thousand pounds, during the last few years. Among the exorbitant prices given for race horses, in England, we notice five thousand guineas for one, fifteen thousand for another. It states, that a Welsh sportsman once offered to the Duke of Devonshire, for the celebrated race horse Flying Childers, the horse's weight in crowns and half crowns, which the Duke refused.

NEW ENGLAND FARMER.

SATURDAY, JUNE 5, 1824.

FARMER'S CALENDAR.

TURNIPS. Every farmer will find it profitable to raise a quantity of these roots. The Mangel Wurtzel and the Ruta Baga, useful as they undoubtedly are, will not completely supersede, nor altogether supply the place of the old fashioned English turnip. In the Memoirs of the Board of Agriculture of the State of New-York, vol. i. page 26., we find the following remarks on the best mode of cultivating this valuable root.

"There is no difficulty in raising turnips on new land; but it is very desirable to know the best mode of raising them, at least a small patch every year, on old farms. Mr. Henry De Bois of this county, [Rensselaer] and Maj. E. Cady, of Columbia county, say, that they have succeeded in obtaining good crops several years in succession by the following process. Turn over a turf of old sward the first week in June. Yard your cattle at night on this, in the proportion of six head at least to a quarter of an acre, until the 20th of July. Then harrow lengthwise the furrows, so as not to disturb or overturn them, and sow in the proportion of about half a pound of seed per acre.

"If it is not convenient to yard cattle upon it sufficiently, about two inches of well rotted manure harrowed in as above will do as a substitute. Mr. C. R. Colden applies the manure by strewing it in shallow furrows two feet apart, then buries the manure by two side furrows, and harrows the ground level, lengthwise of the furrows. This method requires less manure, and he has the advantage of hoeing the turnips in drills."

We recollect, likewise, that we have read in several of our New England newspapers that fine turnips have been raised by ploughing up old sward ground, some time in June, harrowing well and sowing from the 1st to the 20th of July, and this without the application of manure. But, there can be no doubt that folding sheep or horned cattle on the land thus ploughed would very much enhance the crop.

All American writers on this subject, whose works we have perused, advise to sow seed of the common English turnip as late as about the middle of July. They tell us that late sowed turnips are much the best for the table, and that they are less liable to be injured by insects, if sown so late, than when sown much earlier in the season.

Turnips are frequently if not most generally raised in the United States as a second crop, and no doubt this practice is often very eligible and may be perfectly consonant with the soundest maxims of good husbandry. But when it is intended to make the most of your crop of turnips, or to obtain as great a product as possible for the purpose of feeding cattle, we do not perceive any objection to giving turnips a larger portion of the season to grow in, than has been with us the general practice.

An English writer on agriculture, whose remarks on this and other agricultural topics appear to us to be judicious, and to display a thorough knowledge of the subjects of his essays says, "It is not pretended that there lies any solid objections to early sowing of turnips, simply

considered; on the contrary such seems to be the most proper means of obtaining a full crop; but the advantages of early sowing whatever they be are given up, and the season postponed from near three to five months by way of retarding the growth of the crop; that it may last to a later period in the spring, and receive less damage from the frosts than that to which it would be liable in its early maturity. The disadvantages attending this plan are a crop far inferior in weight to what might be obtained from the land; the very common risk of destruction from drought and fly. The weight and perfection of the turnips, being the objects, the land may be got ready for them as for any other early spring crop, and the seed sown with the first warm showers. This will afford ample scope for resowing, should the first seed fail, of which however, granting it to be good, and the land sufficiently fine, I believe there is scarcely any risk."

"As to any advantages of a crop previous to the turnips, nothing scarcely can stand in competition with the first crop of roots.

"The true turnip-soil is a deep sand, or sandy loam. Every gardener knows the proper time to begin hoeing turnips. In general when the plants spread a circle of about four inches they are ready for the first hoeing. They are commonly left about a foot asunder. The second hoeing three weeks after the first."

Those who desire to go extensively and successfully into the turnip culture should raise their own seed from the finest transplanted roots. An English cultivator says, "It is wonderful what a small quantity of seed suffices for an acre of ground, and indeed equally so how it can be delivered and spread over such a breadth. A pint might be more than enough, but it is usual to broadcast a quart on an acre."

Dr. Deane's New England Farmer asserts that "the quantity of seed sown on an acre is never less than one pound, frequently a pound and an half, and by some two. According to the same work it is very necessary for the success of the crop that a heavy roller be passed over the field immediately after harrowing in the seed, provided the ground is sufficiently dry, or as soon as it is in a fit condition. By this means the clods are broken, and much of the seed that would otherwise be exposed to birds, &c. will be covered and the surface rendered smooth and compact thereby, and consequently more retentive of moisture, which will greatly promote the vegetation of the seed and growth of the plants.

If a quantity of lime were sowed over the field immediately after putting in the seed, it would probably preserve the crop against insects, and prevent the turnips becoming spongy, as well as increase their size. Unleached ashes, soot, and plaster, have also been highly recommended as manure for turnips. Thomas Melville, Jun. Esq. of Pittsfield, Mass. in raising a crop which received the premium from the Massachusetts Agricultural Society, in 1817, and which amounted to about 750 bushels to the acre, sowed his seeds in drills of twenty-eight inches the 21st of June, on ground previously well manured. The following day sowed on the acre thirty bushels slacked lime and fifteen bushels horse ashes.

What we have said about the early sowing of turnips we would merely suggest as a hint, or something to be thought of, and perhaps be-

come a matter of experiment. It appears to us that our custom of sowing turnips so late in the season, as is commonly practiced, is an usage borrowed from British husbandry without duly considering the difference of our climate from that of Great Britain, and the different uses to which this crop is commonly applied in the two countries. In England they usually feed turnips off the ground with sheep; or draw them for neat cattle during the winter as fast as they are wanted, and often let them stand in the field till spring to supply green food for sheep at the time of their yearning, &c. But in the United States, this crop must be harvested in autumn and secured from frost; and it would seem to be desirable that they should have had time to obtain their full growth before they are gathered.

TO DESTROY WORMS IN FRUIT TREES. We have repeatedly recommended the trial of something similar to the following, which is copied from the Hartford Mercury, to destroy worms in *Fruit Trees*. It points out the mode of operation somewhat more clearly than any other article, which we have seen on the subject, which induces us to republish it.

Take a half inch auger or bit and bore to the centre of every tree; then by means of a paper tube, fill the hole with sulphur, crowding it with a ramrod; then cut out a green limb from the same tree, and plug the hole. It will not require more than two spoonfuls of sulphur for each tree, and in 48 hours the worms will be the remotest branches. The process will also be beneficial for young fruit trees, even when not troubled with worms; it renders them more thrifty. This process has been found infallible.

LICE ON APPLE TREES ONCE MORE. A gentleman who has been very successful in cultivating fruit trees, asserts that white washing trees with lime will positively destroy this insect, if the application of the white wash be persevered in for three years in succession. The first year it checks their ravages, and lessens their numbers; the second year, puts almost altogether a period to their offensive operations; and the third year effects their total destruction.

ON THE MANUFACTURE OF STRAW AND GRASS BONNETS. We have this day published No. 6, of a series of Essays with this title in order to give all the observations of the author under that head, without mutilating or curtailing his productions. We would not however, be understood to have set the seal of approbation to all that writer's remarks. We have no inclination to become a party in any contest connected with the Tariff, nor to set ourselves up as umpire to decide relative to any real or supposed clashing of claims, or conflict of interests between Manufacturers and Merchants. We wish well to Commerce, are very friendly to Manufacturers, and are *ex officio* the advocate of Agriculture. But when the fire of contention is kindled by statesmen, legislators, speculators, authors, politicians, or any other persons engaged or not engaged in any or either of those branches of national industry we shall endeavor to keep to the windward of the blaze. We have no notion of becoming a burnt offering for the good of the public, at least till it can be clearly made to appear that the public good requires of us such a sacrifice.

THE SEASON. We find complaints in the newspapers iterated from various quarters of the coldness and backwardness of the season. But we have often observed that a cold backward spring is the common precursor of a fruitful summer. If the elements are unkind in May, they generally atone for their frowardness in June.

July and August. Besides our hard frosts have not been so severe nor so late as those which have often visited us. In 1816, we had much cold weather and more severe frosts in June, than we have this year experienced in May.

CRITICISM. In the article furnished us by Col. PIERCE, published in our last paper, in the first column of the first page, of that No. a little below the middle of the column the following line occurs: "to be bedded and *furrowed* on all sides." It should have been, to be bedded and *surrounded* on all sides.

FOREIGN.

By a late arrival at New York, papers have been received from Liverpool as late as the 16th of April; but nothing of a very interesting nature has come to hand by this arrival.

The British government has given notice that measures have been taken for the blockade of Algiers, and warned against any attempt to violate the blockade.

The British Admiral, H. B. Neale, was off Algiers in the Revenge, with five frigates. The Dey had refused to treat, and was making preparations to sustain a bombardment. For this purpose he had dismantled the vessels of war which were in the Bay, and had drawn them under the Mole. He had also commanded an immense number of troops from the interior, to man the fortress. It is said that the Dey has refused to accede to the terms proposed to him, but his officers are disposed to resist his authority, as they are disposed to undergo a bombardment.

Paris papers contain accounts of horrible massacres, and great excesses, which have taken place in several cities of Spain. The prisons of Madrid have been broken, and many persons, detained for political offenses, have been sacrificed. At Cordova about 10 have been massacred—the plot succeeded only in part.

TRIESTE, March 29. Letters from Corfu of the 18th of March give an important piece of news, but which acts confirmation—it is the surrender of Arta, by a particular convention to the Greek General Bazaris. It is added, that the Albanian troops had joined with the insurgents, who immediately advanced to Jannina, which they hope likewise to bring to capitulation. Then the Greeks are once masters of these two fortress they may consider themselves as finally established in Epirus.

Earthquake in Jamaica.—Jamaica papers of the 14th of April, state that a tremendous shock of an earthquake was felt at Kingston on the night of the 14th, which caused great alarm among the inhabitants, who simultaneously rushed from their houses. The churches were opened, and immediately filled by persons of all sects, eager to return thanks to the Almighty for their escape.

DOMESTIC.

Fatal Accident.—Mrs. Susan Mercer, of Troy, N. Y., being indisposed took about a tea-spoonful and an half the oil of tansy, which she mistook for the common sassafras. It threw her into convulsions, and she died about two hours.

Distressing Occurrence.—On the 24th inst., at Woodbury, N. J. two young daughters, the only children of Mr. Joseph P. Heddrick lost their lives by taking a preparation of arsenic, administered to them by mistake *magnesia* by their mother—whose feelings on the sad event none but a parent can conceive. Tampering with drugs is always dangerous, and medicines a deadly nature should never be kept or used but in the utmost care and precaution by unskillful hands. The immediate use of herbs may also produce fatal effects. A lady lost her life in an eastern State, a few days since, by taking too strong doses of the essence of nux.—*N. Y. Statesman.*

Casualty.—While Mr. George Hopkins was adjusting a load of a wagon, the body of the wagon tilted, and an unhappy man was thrown to the height of ten feet and in falling, his head was badly fractured against a axle-tree. He has undergone a surgical operation, and hopes are entertained of his recovery.—*R. I. Am.*

Burlington College Burnt.—The college building of Vermont University, at Burlington, took fire on the 14th ult. from a spark which fell upon the roof, and was

burnt down. The fire was not discovered until the interior of the roof was on fire, so that all efforts to extinguish it were hopeless. The college and society library, and part of the philosophical apparatus were preserved, together with most of the books and furniture of the students. Rooms are to be procured in town for the accommodation of the students and for the public exercises, and the duties of the college are to be prosecuted, notwithstanding this calamitous accident.

CONGRESSIONAL.

IN SENATE.—Friday, May 21. The Hon. John Gaillard was elected President of the Senate *pro tem.*

An additional act to the law to establish an uniform system of Naturalization passed to be engrossed. This provides that aliens, who were infants at the time of entering the country, shall take the oaths after residence for the requisite period, which is reduced from 5 to 3 years. On motion of Mr. Holmes, the provisions of the bill were limited to "free white persons."

The Florida Stock bill passed; likewise a bill to improve the navigation of the Ohio, Mississippi, &c.

A bill for the relief of the Columbian College, in Washington, passed to a third reading. 20 to 18.

Saturday, May 22. This day was occupied in attention to business of a local and private nature.

Monday, May 24. This day was principally devoted to matters of a private and local nature, and in the despatch of unfinished business.

Tuesday, May 25. Certain resolutions, directing the Secretary of the Navy to report to the Senate, at an early period, the ensuing session some particulars respecting the Navy were agreed to.

Wednesday, May 26. Forty seven bills received from the other House were read and passed. Those of a general nature were the bill for "the relief of certain distillers;" the bill "making appropriations to carry into effect certain treaties;" the bill "making appropriations for the Military service of the United States for 1824;" &c.

HORSE.—Friday, May 21. A bill making an appropriation to enable the President to hold treaties with certain Indian tribes was reported.

Mr. Trimble offered a resolution for directing the Secretary of the Treasury to report to the House, the next session, whether any and what provision can be made by law, to distinguish between importations made by aliens, or on foreign account, &c.

The bill making provisions for the settlement of the accounts of Daniel D. Tompkins was so modified as to fix the appropriation at \$60,239.24.

Saturday May 22. The bill for settling the claims of Vice President Tompkins passed.

A bill to authorize the Secretary of the Treasury to exchange a stock bearing five per cent interest, for certain stocks bearing 6 per cent. after debate, passed.

A bill for the regulation of Steam boats, and the security of passengers therein, was reported, and laid on the table.

Monday, May 24. The bill to authorize the Treasury Department to exchange certain stocks, passed.

The bill for the regulation of Steam boats, was debated at some length but not finished.

Tuesday, May 25. Mr. Livingston, from the Committee of Investigation on the memorial of Ninian Edwards, made a detailed report, exonerating Mr. Crawford from all the prominent charges against him.

A bill to fix the Western Boundary Line of the Territory of Arkansas, occasioned an animated debate, and was at length negatived.

Two Messages were received from the President, transmitting an additional Digest of Foreign Commercial Law, and documents relating to Foreign Spoiliations on our Commerce.

Wednesday, May 26. The House sustained a resolution offered by Mr. Cambreleng, calling for information with respect to the amount of French spoiliations for the last 30 years, &c.

The House agreed to a resolution to direct the Committee of Investigation on the Memorial of Ninian Edwards to sit during the recess, and file the Report in the Clerk's Office.

Mr. Clay made some remarks on South American affairs, in which he observed that there was no evidence that the Allied Powers of Europe entertained any designs hostile to the independence of South America, and therefore he should permit his resolution on that subject to sleep on the table.

MASSACHUSETTS LEGISLATURE.

We have not room to give in detail the proceedings of this body, and must therefore attempt merely a sketch.

Monday, May 31. The Governor delivered a speech, which we believe met the approbation of all parties, and as it is in all the newspapers, it is not necessary for us to repeat it. This day was chiefly spent in the requisite attention to choosing Commissioners, and other matters preparatory to the business of the session.

Tuesday, June 1. The Senate concurred with the House in giving instructions to the Committee on the petition of Thomas Kellogg, to report on the subject of the education by the public, of all deaf and dumb persons from 12 to 21 years of age.

A Committee was appointed to report on the expediency of amending the 3d article of the Constitution relating to the qualifications of voters, &c.

Mr. Sprague of S. called for the order of the day on the resolves reported for the choice of Electors. Sunday amendments were adopted.

Wednesday, June 2. A Committee was appointed to consider the expediency of providing by law that persons conscientiously scrupulous of taking an oath should, instead thereof, be permitted to affirm.

The Committee appointed to draft an answer to the speech of his Excellency made a report, which was accepted, and the same Committee was requested to present the same to his Excellency.

A Committee was appointed to consider on the expediency of repealing an act, regulating the practice of law in certain cases.

THE RIVULET.

This little rill that, from the springs
Of yonder grove, its current brings,
Plays on the slope awhile, and then
Goes prattling into groves again,
Oft to its warbling waters drew,
My little feet when life was new:
When woods in early green were drest,
And from the chambers of the west
The warmer breezes, travelling out,
Breathed the new scent of flowers about,
My truant steps from home would stray,
Upon the grassy side to play;
To crop the violet on its brim,
And listen to the thrush's hymn,
With blooming cheek and open brow,
As young and gay, sweet rill, as thou.

And when the days of boyhood came,
And I had grown in love with fame,
Duly I sought thy banks, and tried
My first rude numbers by thy side.
Words cannot tell how glad and gay
The scenes of life before me lay.
High visions then, and lofty schemes
Glorious and bright as fairy dreams,
And daring hopes, that now to speak
Would bring the blood into my cheek,
Passed o'er me; and I wrote on high
A name I deemed should never die.

Years change thee not. Upon yon hill
The tall old maples, verdant still,
Yet tell, in proud and grand decay,
How swift the years have passed away,
Since first a child, and half afraid,
I wandered in the forest shade,
But thou, gay, merry rivulet,
Dost duple, play, and prattle yet;
And sporting with the sands that pave
The windings of thy silver wave,
And dancing to thy own wild chime,
Thou laughest at the lapse of time.
The same sweet sounds are in my ear
My early childhood loved to hear:
As pure thy limped waters run,
As bright they sparkle to the sun;
As fresh the herbs that crowd to drink
The moisture of thy oozy brink;
The violet there, in soft May dew,
Comes up, as modest and as blue;
As green, amid thy current's stress,
Floats the scarce-rooted water cress;
And the brown ground bird, in thy glen,
Still chirps as merrily as then.

Thou changeest not—but I am changed,
Since first thy pleasant banks I ranged;
And the grave stranger, come to see
The play-place of his infancy,
Has scarce a single trace of him
Who sported once upon thy brim.
The visions of my youth are past—
Too bright, too beautiful to last.
I've tried the world—it wears no more
The coloring of romance it wore.
Yet well has nature kept the truth
She promised to my earliest youth:
The radiant beauty, shed abroad
On all the glorious works of God,
Shows freshly, to my sobered eye,
Each charm it wore in days gone by.

A few brief years shall pass away,
And I, all trembling, weak, and grey,
Bowed to the earth which waits to fold
My ashes in the embracing mould
(If haply the dark will of fate
Indulge my life so long a date),
May come for the last time to look
Upon my childhood's favorite brook.
Then dimly on my eye shall gleam
The sparkle of thy dancing stream;
And faintly on my ear shall fall
Thy prattling current's merry call:
Yet shall thou flow as glad and bright
As when thou met'st my infant sight.

And I shall sleep—and on thy side,

As ages after ages glide,
Children their early sports shall try,
And pass to hoary age and die.
But thou, unchanged from year to year,
Gaily shalt play and glitter here;
Amid young flowers and tender grass
Thy endless infancy shalt pass;
And, singing down thy narrow glen,
Shalt mock the fading race of men.

B.

Miscellany.

From the London New Monthly Magazine.

THE PILOT, A TALE OF THE SEA, by the author of "The Spy," "Pioneers," &c. &c. 3 vols. 12 mo.

The very considerable power and ability displayed in "The Spy" and "The Pioneers," the precursors of the present volume, have rendered the author of those works, who is understood to be a Mr. Cooper, of New York, a decided favorite with all novel readers on this side of the Atlantic. "The Pilot" will, we feel persuaded, add still more to his reputation. It is a fine sea-piece, painted with a bold and vigorous pencil, and does great credit to the writer's powers, both of description and sentiment. Although he has chosen the same element for the subject of his sketches which has furnished Smollett with so many happy delineations, yet there is nothing of the copyist in Mr. Cooper's pages. The sea-pieces of Smollett are mostly, if not entirely, humorous; but the scenes of "The Pilot" are of a more chivalrous and romantic character. The novel is, however, by no means deficient in that broad comic humor which seems to flow so easily from the seaman's tongue.

The scene, as in "The Spy," is laid during the revolutionary contest, and the nominal hero is no other than the celebrated Paul Jones, whose debarkation upon our coasts spread so much terror during the period of the American war. The reader, however, is never made officially acquainted with the name of the hero, which he is left to discover by sundry remote inferences. The Pilot himself is, in our estimation, the least successful character in the novel, and, indeed, the only one with whom we feel inclined to find fault. There is too much *Byronism* about him, if we may be allowed the expression. The other characters are well drawn, spirited, distinct and natural. Tom Coffin, or Long Tom, might have figured with great credit to himself and the author on the pages of the Scottish novelist. Many of the scenes are admirably conceived; among which we would specify the taking of St. Ruth's Abbey, the escape of Long Tom, and the loss of Ariel. The latter scene, more especially, is worked up with a degree of energy which makes a powerful effect upon the feelings of the reader.

We are heartily rejoiced to receive such works as those from across the Atlantic, and we hail them as proofs of the growing taste and genius of the Americans.

A Mammoth!—Doctors Van Rensselaer, De Kay, and Cooper, of this city, members of the Lyceum of Natural History, have just returned from an excursion to Poplar, Monmouth county, New-Jersey, where they discovered and have brought home with them, the skeleton of a Mammoth, nearly or quite entire. It was found

upon the farm of Mr. Croxson, an intelligent citizen of that place, bedded in a swamp, some of the bones being ten feet beneath the surface.

A tooth was discovered some months since, which led the above mentioned gentlemen to undertake the expedition, and to prosecute their researches with indefatigable zeal. They were in the mud and water several days, in digging up the skeleton. The bones are now on board a sloop lying at the wharf, but will soon be put together, and deposited in the Lyceum of Natural History. The animal is but little inferior in size to the one in Peale's Museum at Philadelphia. Great credit is due to Mr. Croxson, who afforded to the exploring party every accommodation and assistance.—*N. Y. Statesman.*

The following interesting anecdote of the Beaver, is taken from Franklin's Narrative of a Journey to the Polar Sea, recently published.

"One day a gentleman, long resident in this country, espied five young beavers sporting in the water, leaping upon the trunk of a tree, pushing one another off, and playing a thousand interesting tricks. He approached, softly, under cover of the bushes, and prepared to fire upon the unsuspecting creatures; but a nearer approach discovered to him such a similitude betwixt their gestures and the infantile caresses of his own children, that he threw aside his gun.—This gentleman's feelings are to be envied, but few traders in fur would have acted so feelingly."

NEW ENGLAND MUSEUM.

76, COURT STREET, BOSTON.

CONTAINING much more numerous Collections and greater variety of entertainments than any other Establishment in America, continues steadily to increase, and is open for the reception of visitors

EVERY DAY AND EVENING.

It will be constantly in the best possible condition, and every exertion made to render the visits of its patrons agreeable.

This Establishment now contains FIVE former Museums united in ONE, together with very great and numerous additions (the whole receipts being faithfully laid out to increase it.)

JUST ADDED,

The celebrated Race Horse Eclipse,
A beautiful Cosmorama View of London,
A large and beautiful live Rattlesnake,
The Arabian Bottle, made of the stomach of a Camel—holds about a barrel—used to carry water across the desert.

The Invalid's Chair—very ingenious—invented by Professor Pock.

A very large and elegant Sword Fish, upwards of 14 feet long, with a sword 4 1-2 feet long.

The Museum is well lighted, and a Band of Music performs every evening. Admittance 25 cents. June 5.

WANTED Nos. 14, 43, and 45, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper.

TO PRINTERS.

FOR sale at this Office BALL SKINS, at the usual prices.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *early* days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

Correspondence.

THE MOON'S INFLUENCE ON VEGETATION.

To the Editor of the New England Farmer,

Sir,—Anticipating that you are fond of new and useful investigation, I wish to inquire through the medium of your useful paper what tendency or influence that satellite has, which attends the earth in its revolutions round the sun? There are some very honorable gentlemen observed at the moon has an uncontrovertible power over the vegetable productions of the earth. They assert that the seeds of those plants which stand upwards, such as corn, rye, and wheat, &c. should be put into the ground at the increase of the moon, and of those which extend downwards, such as beets, carrots, ruta baga, &c. at the decrease of the moon. And also that the full moon has a similar effect on the sap of the trees. The full moon the sap extends with more fluency than at the change. These things have been asserted as facts, known by observation and experience. But, however certain those gentlemen may be of their theories, they yet remain to me unexplained, dark and mysterious. I must, however, own that their reasoning appears logical, but there has not yet been enough said on the subject to convince me of its certainty.

If the moon causes capillary attraction, in all kinds of trees and vegetables, we may very well suppose that it produces the cause of cohesive attraction; and if it produces the cause of cohesive attraction, I must own that the moon has a very minute influence on our earth.* If you, your correspondents feel disposed to communicate your opinions on this important inquiry, you may, undoubtedly reflect some light on the interesting question. A question, which ought longer to remain doubtful at this late period of the world. If you can convince the world that the moon has actually an influence on our seeds and vegetables, I anticipate that the discovery would be highly valuable to the community, and more particularly to those persons, who lead an agricultural life. If our seeds ought to be put into the ground at the discretion of the moon, in order to determine the plenteousness of the harvest, I apprehend we should feel the awful effects of starvation more in the absence of the moon than if the sun should discontinue to make his appearance in the horizon at appointed time. Although I feel anxious, there is such a co-existing influence between the two planets to have it promulgated if it would confer any benefit to mankind yet I rest perfectly satisfied with the divine prediction, "Seed time and harvest, summer and winter, day and night should continue to the end of things."

Yours, with esteem,

JOSEPH W. CAPRON.

Attleborough, May 29, 1824.

In reply to the queries and suggestions of our correspondent, we would briefly remark that we are altogether

We do not recollect to have ever heard or read of the moon's having any agency in either of those kinds of attraction.—Editor.

ther incredulous on the subject of the Moon's influence on vegetation; and believe that some farmers accuse that planet of meddling with matters, in which she has no kind of agency. That the moon has some effect on sublimary objects is however true. She enlightens the earth, draws it a little from its direct path round the sun, causes a small oscillation in the earth's axis, and produces tides in the ocean and the atmosphere. But we do not believe in her having any hand in any of the phenomena of vegetation; or if she has any efficiency in that line it is so very minute as not to be worth investigation. The subject, moreover, has been so often introduced into our paper, that, unless some new light could be elicited, its further discussion would seem superfluous. We would refer Mr. Capron to the first volume of the N. E. Farmer, page 11, for Col. Pickering's and to page 370 of the same volume for Mr. Preston's opinions on this subject. He may likewise find an able article on the same topic extracted from the Edinburgh Magazine, and published in the 2d No. of the 2d volume of the N. E. Farmer, page 12.

ON HOEING CORN AND POTATOES.

To the Editor of the New England Farmer,

Sir,—As your paper is devoted to the interests of agriculture, and seems to be the direct and proper channel, through which information relative thereto ought to be circulated, I take the liberty to send you a few hints on hoeing corn and potatoes; and should you think my communication worth noticing, you may publish it, if not, throw it under the table.

Corn should always be hoed three times, and that too in good season. It should be hoed the first time as soon as it is large enough to plough amongst it without covering it over with clods and dirt, for if neglected too long, the weeds will get so far a head as to render it difficult to kill them, besides the extra labor of hoeing caused by neglect.

The principal object at the first hoeing, should be to stir the ground and destroy the weeds, which should be completely exterminated if possible by hoeing them up and leaving them between the rows, exposed to the sun, which will cause them to wither and die.

At the second hoeing or half hilling, as it is generally termed, which should be performed within ten days or a fortnight after the first hoeing the ground should be thoroughly stirred and the corn moulded up making the hills broad and shallow.

Corn should be hoed the third time or killed, just before the tassels appear. It should now be ploughed deep in order that much loose dirt may be left between the rows which will tend to prevent injury from drought.

The hills now as at the second hoeing should be made broad and flat so that the rain and heat may easily penetrate to the roots of the corn. The old practice of making high hills and scraping all the loose dirt from between the rows, I believe to be injurious and perfectly wrong as the influence of the sun and refreshing showers are in a great measure prevented hereby. Much care is necessary when ploughing and hoeing corn the third or last time especially if it be done in wet weather, lest many of the stalks

be injured and broken down as at this time they are extremely brittle and tender.

Potatoes should be twice hoed, being well ploughed between the rows, being careful to destroy all the grass and weeds that they may not be choked and stunted therewith.

In hoeing potatoes there is danger of making the hills too large and thereby diminish the crop. I am fully satisfied that they flourish best near the surface of the ground. Like corn they need the influence of the sun and small showers of rain which frequently occur during the summer months. I have known good crops of potatoes raised on tough land without hoeing them once; but in such cases the extra labor in planting is at least equal to once hoeing, and I think it is not so beneficial to the land.

CULTIVATOR.

County of Worcester, June, 1824.

PRESERVATION OF VINES.

To the Editor of the New England Farmer,

Sir,—Having had my vines for a number of years almost or wholly destroyed by the common striped insect which infests them, and having tried a number of preventives to no purpose, I have at length hit upon one which effectually answers the purpose, and should you think it worthy a place in your paper, you are at liberty to publish it.

As soon as I find any of the insects upon my vines, I apply a small quantity of gypsum finely powdered with a sieve or dredging box, upon each hill. Thus I do when the vines are wet with rain or dew, that it may adhere to them. Should this be washed off with the rain, I renew the application till the vines have gained sufficient maturity to be out of danger.

I have tried the above remedy for five years and have never lost a vine after the application of the gypsum.

A GARDENER.

Guilford, Con. June 2, 1824.

P. S. The French gypsum is the kind which I have used.

AGRICULTURE OF NOVA SCOTIA.

[Concluded from page 357.]

The state of the fact then, as regards our agriculture, is simply this. There is still needed for our internal consumption an annual supply in Halifax of 23,121 barrels of flour and of 23,518 bushels of Indian corn, besides several other articles as particularly specified in the Custom House return. The leading object, that ought to engross the care of this Society, should be the consideration of the further measures which may reduce to nothing this heavy balance still subsisting against us; and which may accelerate our final and total emancipation from all need of foreign grain. These measures may be comprehended in the four following particulars, and in illustrating them, I shall take occasion to bring under review all such facts and circumstances as any way affect, or bear upon the present stage of our progress.

1st the establishment of societies should still be encouraged in those populous parts of the province where none now exist.

This recommendation proceeds on the faith of their utility in generating and diffusing a spirit of enterprize—in begetting an emulation to excel in the operations of husbandry—in cherishing careful and industrious habits in the management of the farm—and in enlarging and correcting the views of cultivators, as to the value of manures, the benefits of improved machinery, and the advantages of drilling, fallowing, draining and composting. Some of the official letters in answer to the Circular of the Board speak largely on these heads. They tell us, that these consequences are visible within the range of their influence, and that too on the very lands of the men who refuse to join the societies, and are even a little noisy in vilifying and abusing them. So strange are the caprices of the human heart, that such a statement ought not to be discredited, and should reconcile us to that contradiction at which all are too apt to be peevish. Let us give free indulgence to those who take pleasure in running down the usefulness of their local society, provided they copy the example of its more active and intelligent cultivators. Every association in the Province, which is animated with a suitable spirit, becomes a nucleus of improvement; and from it radiate those gleams of light which are illuminating the practices of the more ignorant. Its benefits are not confined to its own members; for if they carry into the fields the more approved methods of culture, the captious and the incredulous cannot look on without instruction, and so great is the superiority of truth, that it will eventually gain either a willing or reluctant obedience.

2d. Our independence may be much accelerated by a more general erection of oatmills.

Wheat, I believe, in every country under Heaven which lies within the northern temperate zone, either in the old or in the new world, and where this grain has always constituted the staple article of bread, finds the readiest sale of all other agricultural produce. It is the prince of the *cereal graminæ*, and forms, when ground, a loaf that is eminently nutritious, very invigorating, and palatable to all tastes. The cultivators of the soil in the different European kingdoms, as in France, Germany, Prussia, Poland, as well as Great Britain, lay their account with the disposing of this grain, either to pay rent or to purchase necessary supplies for their families. It is considered as the ready money of the farmer, and with it he goes to market. It is obvious that, before he can avail himself of the universal demand for wheat, he must provide some other substitutes for his own domestic consumption. These vary in different countries, and are regulated by the capabilities of the climate. The Swede mixes a particular kind of ground bark with his coarse meal—the Frenchman lives on soups formed partly of bread, but with a liberal allowance of vegetables—the Italian subsists on fruit and millet, joined to his macaroni—the German eats a large proportion of rye bread—the Irish farmer deals much in milk and potatoes—the English has recourse, as helps, to barley and oatmeal—the Scotch uses peas, barley and oats—and the American throws his chief consumption on Indian corn. The agricultural classes in all these places satisfy the common demands of nature with something else than wheat, and save this latter for the home or foreign

market. Such examples are not unworthy of our imitation. It would be among the last thoughts of my heart, and among the last words I would utter, either to desire or say that every farmer in Nova Scotia should not have a wheat-loaf for his use whenever inclination prompted; but I do not hesitate to recommend a more general substitution of coarser food. Barley, peas and oats are found to be both excellent and wholesome; and when the taste is once formed on them, our peasantry, by adopting these, would be equally happy, equally vigorous, and unquestionably would become much more opulent. Oatmeal at first is never highly relished; but it soon becomes agreeable and is acknowledged to be favorable to muscular strength, health and longevity. It has been falsely supposed to be the exclusive and national food of Scotland, but so far is this from being true, that it is extensively used through many counties of Ireland, and through all the north of England.—It is common in France, not only on the coasts opposite to Britain, but it was met with between Toulouse and the Pyrenees by Arthur Young, who was so much struck with the universality of this food, that he quotes on the occasion a passage of Sir James Stuart's to the following effect:—"Oatmeal, says he, is found in Catalonia, Auvergne, and Swabia, as well as in Lochaber." The strange prejudices, therefore, which appeared on its first introduction here about four years ago, were without any just foundation; and it is not surprising that they should have so quickly vanished in all those parts, which have since had the advantage of experience. Many who disliked it at first, have become warm in its praise, and are assisting, with a laudable zeal, in spreading its character and usefulness among the farmers.

3d. Every encouragement should be given to the growth of wheat, and the utmost attention be paid to the improvement of flour mills.

The county and general prizes for the culture of wheat, which were first offered last year, have been productive of good effects, and they ought still to be continued, in order to propagate that spirit which they seem to have awakened. In the official letter from Maubou a very important notice is given, which is strongly indicative of the excitement diffusing itself throughout the country. A member of that Society, stationed in an obscure part of Cape Breton, is making preparation to have next season no less than from 20 to 25 acres under wheat; and it distinctly states, that the motive for this uncommon effort is to obtain one of the county prizes. The returns too already made, of the last crop display a compass and boldness of design in raising wheat, which could hardly have been anticipated from any thing yet tried in that line. From King's County claims have been given in, setting forth that

One farmer has grown	950 bush.	weighing	62 lbs.
A second	"	710	" " 60 "
A third	"	495	" " 60 "
A fourth	"	406	" " 60 "

and from several counties the certificates very commonly attest from four to five hundred bushels. These are quantities to which we have not been accustomed, and which demonstrate with infallible certainty the good resulting from the past system.

We have now three flour mills in the vicinity of the capital, which must tend to open a very extensive market, with all the benefit of competition, for whatever wheat may be brought hither for sale. In a few years there is reason to hope from present appearances, that our farmers will be relieved of the trouble of manufacturing their own produce—that more capital will come to be vested in such establishments—that all sorts of grain will be purchased by corn dealers and factors, and afterwards ground at their expense according to the demands either of the home or foreign market.—Nothing will facilitate this so much as the erection of improved mills, in all quarters of the Province.

Lastly, our independence will be hastened by the dissemination of industrious habits.

The life of a farmer has a direct tendency to gender close and careful attention to minute objects. The abundance and safety of his crop depend upon so many circumstances over which he has a command, and to the operation of which he must ever be alive, that his mind is kept in a state of perpetual excitement;—not that morbid kind of it which is caused by the turbulence and wreck of the passions—but that which is connected with a healthy and cheerful mood of mind, and connected too with the exercise of patience, discretion and industry. The cleanliness and comfort of his cattle—the condition of his implements—the correctness of his ploughing—the choice of his seed grain—the time of sowing—the course and change of the weather are constantly stimulating him to activity, and are incompatible with all languor and indifference. An arable farm is one of the best schools for plodding laborious diligence and no man can manage it to advantage, who ever suffers his attention to relax, or to be dissipated in trivial avocations. The loss of a day may affect the issue of a whole year's labour, and negligence in small matters is often followed with great and mischievous consequences. These observations however, are more applicable to a cultivator than to a grazier. The general introduction of the plough into country never fails to propagate those industrious habits, which are the certain harbingers of national wealth.—Such habits merit the highest encouragement on their own account, and they force the universal cry that has been raised in behalf of flax mills should be listened to with gracious ear. The industry, which is called forth in the fields, should not be permitted to evaporate during winter in idleness and inactivity. These mills should be erected, the male portion of the population may find profitable employment in carrying their flax thither—in breaking and scutching it, and afterwards in bringing home for heckling, at which point their labour should stop, and the spinning should be taken up by the females. All these preparatory processes, which have been now enumerated, require more skill than we at present possess, and are divided in the old country into distinct trades and professions. That of the heckler, for instance, is one of the nicest and most difficult of manual operations, and perfectness in it is known and measured by the greatness of the quantity of dressed flax which is taken out of a given weight of the rough. From a stone of 1 lb. in Scotland, which weighs 22 lbs. English, usually come from 12 to 14 lbs. of dressed flax fit for domestic linen, 1 lb. of shorts called vulga-

birds, and from 6 to 8 lbs. of tow separated naturally by the hecklers into two qualities. Our women here perform this labour to much disadvantage, from the want both of operative dexterity, and more perfect instruments. The skill which they do require, however, deserves the highest praise; and that napkin of diaper, now laying on the table, which was spun, woven, bleached and finished by the hands of Miss Sarah Archibald of Musquodoboit, bears testimony of what can be accomplished.

CHIMNIES.

Method of building chimnies that will not smoke.

Contract the space immediately over the fire, so that you may be sure of the air being well heated and rarefied there: this will ensure a current upward. All chimnies should be carefully built, and every joint well filled with mortar, so as to prevent communication in case of the chimney catching fire.

Smoky chimnies are frequently occasioned by their being so very narrow as scarcely to admit the children, usually employed for the purpose of sweeping them, to reach properly to the top. This evil may be remedied, and that inhuman practice rendered unnecessary, by adopting the following mode, which has been used for time immemorial in Edinburgh, Glasgow, and other cities in the North; and which effectually answers the end intended.

Procure a rope for the purpose, twice the length of the height of the chimney, to the middle of which is to be tied a bush (of broom, straw, &c.) sufficiently large to fill the chimney. Put one end of the rope down the whole passage; and, if there be any windings in it, a bullet, or round stone, is to be tied to the extremity of the rope, and the wood end of the bush introduced after the rope has descended into the chamber, where a person must pull it downwards. By the elasticity of the twigs, the bush sweeps the sides of the chimney as it descends, and carries the soot with it. Should it be necessary for the man at the top, who has hold of the rope, to draw the bush up again, the person below must turn the latter, so as to send the wood-end uppermost, before he gives notice to the assistant at the top to pull it upwards. Chimnies thus cleaned, never require one-tenth part of the repairs, rendered necessary where they are swept by children: for, as these are obliged to work themselves up, by pressing their knees and feet on one side, and their backs on the other, they not unfrequently force out the bricks that divide the chimnies. *This is the chief cause why, in many houses of cities, a fire in one apartment always fills the adjoining ones with smoke, and sometimes even the neighboring house. Whole buildings have often been burnt down, from this concealed cause; as a foul chimney, taking fire, communicates it by these apertures to empty apartments, or to such as were filled with lumber; and in which it was thought unnecessary to make any search, after the fire had been extinguished in the chimney where it first began. We, therefore, seriously recommend this practice to be universally adopted, as an object of interest, not less than on account of its humane tendency. It would, farther, be no detriment to those who procure their subsistence by the sweeping of chimnies; for, if this plan should be countenanced, they would be as ne-*

cessary, then, for the convenience of the public as they are at present; and those very persons would be unavoidably induced to provide themselves with ropes for the purpose. Lastly, such a beneficial change might afford the only practicable means of rescuing many unfortunate children from their degraded situation; prevent many accidents by which they become deformed; and obviate the evils attendant on a premature old age.—*Domestic Encyclopedia.*

PERKINS' STEAM ENGINE.

Extract of a letter from a gentleman in London, to the editor of the N. Y. Daily Advertiser, dated April 23, 1824.

Mr. Perkins' discovery has been, I think, overrated by his friends and too lightly estimated by his enemies. I have taken some pains to understand the subject, and the following appears to me to be the state of facts. Mr. P. has undoubtedly made a great and valuable improvement in the steam engine. The evidence of this is that he has now in his establishment two engines in operation—one a small engine of perhaps 5 horse power, the first that they constructed; the other a 12 or 15 horse engine. The latter is connected with a pump to raise water, by means of which the exact power of the engine may be ascertained. This is nearly completed, and the result of the experiment will probably be soon communicated to the public, perhaps by Mr. Perkins himself, who is, I learn, about to publish a description of the engine. Sufficient experiments have been already made to induce Perkins & Co. to contract to furnish engines which will save two-thirds of the fuel and 19-20 of the water used in other engines. My own opinion is that the engine will even do better than this, besides saving half the cost of construction, and 4-5 in weight and bulk. Such is the entire confidence of the concern in the engine, that they have now building a vessel of 400 tons, in which 2 engines of 50 horse power are to be put, for the purpose of going to India.

Mr. Perkins' Steam Gun, of which you may have heard, is a discovery resulting from that of his steam engine. He discharges at the rate of 240 ounce balls per minute, from a musket barrel, with a force equal to that of gunpowder. This extraordinary affair attracts thousands to witness the experiments, among whom I have seen Dukes, Marquises, Earls, Viscounts, Barons and Baronets. There can be no illusion in this matter.—Mr. Perkins is a frank man, incapable of practising any deception of which he is not, with others, the subject. He foresees no difficulty in applying his discovery to military purposes, to the exclusion of gunpowder. This perhaps is counting too fast—but I shall not be surprised to see, as the result, a considerable modification in military and naval tactics.

An engine is now constructing to be taken to the U. States by Mr. Goodrich, of Connecticut, in July or August—he being appointed the agent of Perkins & Co. to manage their affairs there. Thus you see, the people of the United States are likely soon to have an opportunity of judging for themselves of the success of their ingenious countryman, without being left to doubt amid the contradictions of interested publications."

Deviation of the Mariner's Compass.—The Board of Longitude has conferred the parliamentary premium of £500 on Mr. Peter Barlow, of the Royal Military Academy, for his method of correcting the local attraction of vessels. The great quantities of iron employed at this time in construction and equipment of ships of war produces so much deviation in the compass (varying according to the direction of ship's head) as to render it almost an useless instrument, particularly in high northern and southern latitudes. The difference has been observed in the recent voyage of the Griper to amount to 50, and at Spitzbergen, to 75 degrees. Mr. Barlow's method of correcting this has been completely successful, though extremely simple. It consists in merely placing a small plate of iron about the compass, in such a situation as to counteract the effects of the ship in any one place; after which, without removing it, it continues to do the same in all parts of the world, whatever change may take place in the dip or intensity of the magnetic needle. The important advantages that will result from this discovery, are too obvious to require enumeration.—*London paper.*

Horticultural.—There were lately in bloom, at the Linnean Garden, New York, six plants of the species of *Pæonia*, *Montau*, or *Tree Peony*, one alone of which exhibited forty-one buds and flowers. Each flower was from 18 to 20 inches in circumference, and combined with splendid color an agreeable fragrance. The number of bulbous flowers which have bloomed, the present season, in that garden, exceeds 23,000, of which 15,000 are yet in their beauty. Of early tulips there are 120 varieties, of *Bizards* 158, *Violet Bibloems* 118, *Rose Bibloems* 81, *Primo Baguets* 20, *Baguets Rigauts* 118, double flowering 83, *Parrot* 10, *Breeders* 22, forming a complete collection of different classes.

To give lustre to Silver Plate.—Dissolve a quantity of alum in water, so as to make a pretty strong brine, which you must skim very carefully—add some soap to it, and when you wish to use it, dip a piece of linen rag in it, and rub over your pieces of plate. This process will add much to its lustre.

Curiosity.—We lately saw a curious specimen of ingenuity, in a miniature Malay Proa, with a crew on board, and every part of the rigging complete, the whole made of cloves so nicely strung together, that they appear to be one mass. We understand that it is to be deposited in our Marine Museum, a present from Mr. Shillaber, of this town, commission merchant at Batavia.—*Salem Ob.*

Agriculture.—He who has dominion over an acre, and rescues it from barrenness, and covers it with a smiling harvest, has more virtuous self-applause, than the conqueror of large territories, waste and desolate. The culture of the earth savours of filial affection. It is our bounteous mother; it affords us nourishment, and shelter and shade—fertile streams—fragrant flowers and refreshing fruit. We should love it for the sake of the living—for the sake of the dead. A beautiful plant, or a luxuriant vine, may suggest to a poetical mind the spirit of departed beauty, putting forth again from the earth where its form was inured.

From the United States Gazette.

On the Manufacture of Straw and Grass Bonnets.

No. VIII.

The following notes on the Manufacture of Leghorn hats, are from the delightful letters of Chateavieux, of Geneva, (letter 6th.) on the Agriculture of Italy, written in the years 1812 and '13.* Speaking of the romantic Vale of Arno, he says,

"The road on each side was bordered with village houses, not more than a hundred paces from each other; they are built of brick, and in a justness of proportion, and with an elegance of form unknown in our country. Before these houses we saw groups of peasant females dressed in white linen, silk corsets, and straw hats ornamented with flowers, and placed on one side of the head. They are constantly employed in braiding fine straw plats the treasure of this valley, and with which the straw hats of Florence are manufactured.

"This manufacture has become a source of prosperity to the valley of Arno; it brings an annual return of three millions (of francs) which are divided among the females of the country, for the men have no concern in this branch of industry. Every young woman, for a few pence, purchases the straw she has occasion for; she exerts her talent to braid it as fine as possible, and sells for her own profit, the hats she has made; the money which she thus earns, at length, forming her dowry.

The father of the family, however, claims of the females of his house some of the labor on his farm; this is done by the women from the mountains, who are paid by the younger women in the plain, out of the profit on the hats, for doing the work for them. They earn from thirty to forty sous per day in plating straw, while they can hire a poor woman from the Appennines, for eight or ten; by which means they also preserve their hands from being hardened by rustic labor, which would lessen the flexibility of their fingers, so necessary in a work of such fine texture.

"Such are the female peasants of the Vale of Arno, whose beauty and graces have been so much celebrated by travellers, whose language Alhieri went to study, and who seem born to embellish the arts, and serve them as models.—They are the shepherdesses of Arcadia, but it is because they are not peasants, resembling them only in their health and freedom of care, and knowing nothing of their pains, their scorching weather, and their fatigues. I have been assured that a crop of two acres, will supply straw sufficient for the whole manufacture of hats in Tuscany. It is the straw of beardless wheat, cut before it is quite ripe, and which the sterility of the soil renders white.—The soil is chosen in the calcareous hills; it is never manured, and the seed is sown very thick. These houses being so near each other, it is evident the land annexed to them must be small, and that property in these valleys must be very much divided; the extent of these domains being from three to ten acres." ps. 73, 74.

It appears from these extracts that the girls of Tuscany, carry on the braiding of straw, at home, as those of New England did when the business flourished. How shameful it is to de-

prive them of the means of gaining an honorable support, and of enriching the nation, by their labor!

The following extract from a late English paper, shows what has been done in consequence of Cobbett's publications on the Leghorn hat business. The people of the United States will be able to collect some useful hints from his remarks, although a few of them do not apply to our situation; but they could not well be omitted.

From Cobbett's Register.

The farther I inquire and observe, the more complete is my conviction, that the Italians seldom or never make use of the straw of grass; and I am of opinion that we ourselves shall rival and beat these Italians with their own means; namely, the *straw of grain*. I have now numerous specimens of Italian plat before me; some very coarse, and some very fine, though by no means so fine as the plat of Miss Woodhouse. Very fine, however, and I am convinced that even this fine is made out of the straw of grain, though to obtain straw sufficiently fine for the purpose, great pains must have been taken.

The way to obtain the straw was to sow wheat or rye at the rate of about fifteen bushels to the acre. Miss Woodhouse chose to make use of grass in order to surpass the Italian in the fineness of the work, and she has surpassed them; but the straw of grain would be gotten much easier than that of grass, for a prodigious quantity would stand upon an acre of land; it would be all of one kind, and would be free from weeds, and from all sorts of rubbish.

Probably enough straw to make five thousand bonnets might be grown upon an acre of land. It should be cut just when the milk is coming into the grain of the head ears of the field. In most fields, especially in the woods and countries, you will find places under big trees and along the furrows where the straw is very small, and where the ears are scarcely an inch long, and have no grain, or only a single grain, in each of them, and at an imperfect one. In the "Cottage Economy," I mentioned the different sorts of wheat and pointed out those which I thought best for this purpose; but I am satisfied that any sort will do.

The grass of various sorts may, nevertheless, be used; and I can see no reason why the great variety of sizes and of colors, afforded by the grass should not prove advantageous, rather than otherwise. Certain it is that we have all the materials here; and certain it is also that I have at this moment platters at work upon English rye straw who are producing work equal to any that I can find that has come from Leghorn. This is coming to the point; and the point will have been come to in a very short time; for it will not take more than a fortnight to turn this plat into bonnets. I prefer beginning upon the grain straw, because it is the very same material that the Florentines make use of. Several sorts of grass will make much finer and much more beautiful plat; but it will not be the same as that which comes from Leghorn. It will be better, but not the same; and therefore I begin with the straw of grain, and which does, indeed make very beautiful plat.

The eight pieces of plat sent me by W. E. from Norfolk, exhibit a most admirable specimen of attention, industry, and skill. Five are,

I see, from the common Bonnet grass; two from the crested dog's tail, and one from the maiden's hair grass. None of them are exquisitely fine; but number seven is most beautiful. I have compared it with a piece of Leghorn, which is nearly of the same fineness; and in every respect the Norfolk production is the best. These specimens contain six instances of joining or knitting together; and the doing of this has, it seems, been discovered by the lady who made the plat. Better judges than I am, pronounce this knitting to be perfectly well done. It is with great difficulty that the eye can trace the joining; and, therefore, we need be in no apprehension as to an incapacity to perform this part of the work.

A gentleman from Suffolk has sent me some specimens of plat made by his daughter and his maid servant. These are very good, and his specimens of grass are very good also. The difficulty which he finds in getting the platters to work upon the new plat will, I imagine, very soon disappear. People are always unwilling to consider that which they have been accustomed to do, as being of less value and less importance than that which they have not been accustomed to do. But a short time gets the better of this sort of feeling, and such will be the result in the present instance. I look upon the discovery as of the greatest importance, as leading to the habit of domestic manufacture; and by domestic, I mean the family where the article is used. At present, the persons who plat straw, live in particular districts, and follow the platting as a sort of trade. This to a certain extent, and for exportation, perhaps may be desirable still; but what I want to see is this, the hats and bonnets made in peoples' houses after just the same manner as shirts, cravats, and such things are made. Before, when we had no idea that we had the material to make them of, or where to get straw to split, it was necessary to go to the farmer and make a purchase; when this was the case the hat and bonnet makers naturally congregated together, and became the under workers of the master manufacturers or dealers; so that the thing had to pass three or four hands before it reached the wearer. Now let it be borne in mind, that all middle men are mischievous, if they can possibly be done without. The miserable creatures in Ireland, owe one half of their calamities to middle men. The middle men take away that which ought to remunerate productive labor. Suppose a gentleman with a large family, living in some village. His family expend ten pounds a year in straw hats and bonnets. They get them from the neighboring town. The bonnet man in this town has received them from a bigger bonnet man in London. He (for we will suppose them to be English produce) has had them built, after having bought the plat of a plat merchant, who had first bought it of the platters in the platting district. Here, then, are three persons between the plat and the wearer. These three persons must each of them have a greater profit than the plat. Now, is not this a very absurd way of going on? You have the materials in every field and every hedge. It costs little more trouble to get them than it does to pick a nosegay. You get enough, in five minutes from the side of a footpath under any hedge in the kingdom. Is it not better than to

* Translated by Dr. Rigby, London 1819.

ve a part of the ten pounds to the working people in your own neighborhood, to come and let you to build the hats and bonnets, than to divide the whole ten pounds amongst strangers. It is not to be expected that such a change will be accomplished all at once. Trifling as difficulties are, they must be overcome; and will now endeavor to remove some of them. The great difference between a Leghorn hat and an English one consists of the different manner of putting the plat together. The Leghorn is what is called knitted together; and is a very nice business, and difficult to learn. Nevertheless, more than ten persons have sent me some specimens of their knitting, which I find to be perfectly well done. But it is to be observed, that, in order to render the knitting practicable, the plating must be performed in a certain manner. The plat must consist of 13 straws, neither more nor less. The edges of the plat must be so constructed as to the eyes, or loops, or slips, as they are called, not to pull out when the needle passes along to knit the two pieces of plat together. In order to secure this point care must be taken, when a fresh straw is put in, to give it so much of the fastening before its turn comes to be on the edge as to make it secure against the force of the needle. Whether this can be learned without seeing and examining a piece of plat properly made, I do not know; but learned it must be for it is essential.

This work of knitting has been considered as a sort of mystery, retained to themselves by the Jews and Jewesses of London. However, already has there been an inroad made upon the mystery. I understand that several Christian women have learnt the Jewess mystery. What will take place will be this:—The women will keep schools to teach knitting, and the mystery will very soon be in the habit of learning at the same time they learn their letters and learn to sew. It is right that those who possess the talent should be paid for the communication of it to others; and they will be paid for it of course; but it cannot long remain a thing as commonly known and as easily performed, and more easily too, than the making of a collar of a shirt. Be it always understood, that, as far as my wishes go, I would not give a thing for the thing, unless it became as general as any of these domestic works which our wives, daughters and servants are in the habit of performing. It is to prevent the thing being confined to particular districts, that I am taking these pains. I want to see it diffused. I want to see it in such a state, that any lady in the country shall think no more of sending to London for a bonnet than she would of sending to London for butter or milk. It is a thing perfectly matchless in its facilities. The materials are to be found as easily as the dirt we tread upon. It is not necessary to be possessed with farthing in order to acquire them, in a certain extent, at any rate. There is scarcely so great a brute in existence as to prevent a poor creature from cutting a bundle of grass in his hedge; and what hedge is there that does not afford such bundle?

It is not the number of hats and bonnets that has been used which we are to look upon as the number that will be used. Gentlemen who

are ashamed to put the poor miserable things of common straw upon their heads, will be delighted with a hat made of materials such as I find in the eight specimens sent up by W. D. from Norfolk. His wife made the plat and knitted it. She had no teaching to do either; and what a beautiful hat might be made out of numbers five or seven of this plat. So that we are not to suppose that the number of hats and bonnets would be increased. Besides, as I have elsewhere observed, a great exportation would certainly take place, and in this whole country, particularly the landholders, are deeply interested. The exportation from Italy is very great. Many millions a year are brought to that country by the export of the several articles made of straw. We are told that the Italians work cheap; but I am quite satisfied, that in spite of their cheap working, we shall very soon work them out of this species of traffic. If I lived in the plating districts, I would have persons brought thither to teach the young girls how to knit the plat and how to make it in the proper manner.

The manufacture that I endeavor to set on foot may be made extensive; it may be made a blessing to the laboring people in particular. It may be made to draw from the rich of this country, and from those of foreign nations too, the means of good living to those who are now miserably fed and miserably clad. If some Irish Lord were, instead of spending his time at a watering place, to set about the introducing this into Ireland, what good might he not do? The Italians cannot work cheaper than the Irish could. However, I expect I must confess, much more to be done by the middle ranks of society than by any body else. To them we must leave the undertaking. I hear and indeed I know the fact, that the importers are now selling Leghorn bonnets at a loss. But what will the benefit be if we prevent the sending of half a million of money out of the country? To do it effectually, large tracts of grain must be sown in the fall, for the purpose of raising straw. Nevertheless, I cannot help thus early observing that, if I were a little farmer (no matter in what part of the kingdom,) I should be already fixing upon a piece of ground in which to sow some wheat or some rye. Fine employment for daughters and boys to cut, to bleach, pluck, and to prepare the straw."

From the American Farmer.

TO PREVENT SKIPPERS IN BACON.

MR. SKINNER,—One of your correspondents, some time ago, recommended packing hams in dry oats, to prevent their being injured by skippers.

In the year 1822, having plenty of coarse salt on hand, I prepared dry casks, placed the hams and shoulders on their ends, and filled the interstices with dry coarse salt, covered the tops completely with salt, and settled it well; about mid-summer, I unpacked and examined the hams, replaced them again in the casks as before, and drew them out for use when required, there was not one skipper found, and the bacon was fine. Last year not having a sufficiency of salt, I packed my hams and shoulders in dry oats, in the same manner, examined them once in the summer, and found they kept equally as well as when packed in

salt. I have not seen a single skipper on bacon so treated; but I have, before I adopted this method, been sometimes very much injured by them. It is now the right time to pack hams in oats, and I shall take mine down in a day or two. It is a cheap and very practicable method, no expense attending it, the oats are not injured, they can be used when you have your old hams in the fall, and I would advise a general adoption of this method. It is very little trouble to unpack them, and it may be best to examine them two or three times in the summer—it changes their position. When two pieces touch each other they may get mouldy, but being very particular to see mine well separated by the oats, not one would have injured if they had remained until the fall without being drawn.

TO THE EDITOR OF THE AMERICAN FARMER.

SOAP MAKING—BY THE "COLD PROCESS."

Albemarle, Va. May 15, 1824.

MR. SKINNER,—It is my custom, in reading over your valuable journal, whenever I come across any article relating to domestic economy, to read it out to my wife, who, you must know, is a notable manager and great economist. In the 14th No. of the Farmer, a process of making soap is detailed by a housekeeper, of simply mixing the ley and grease together, and placing it in the hot sun, without any boiling. When I read this account to her, which is wound up by the emphatic enquiry on your part, "can this be true?" "True!" said she, "certainly, it is true; I have made soap in no other way this three years, and I believe every body in this neighborhood does the like—only I do not take the trouble to measure the ley and grease, and set it in the hot sun, but I put my barrel, (a common fish barrel,) in the cellar where it is intended to stand, and fill it nearly full of strong ley, then add as much grease, without melting it, as I think sufficient, stirring it once every day or two. In a few days I can tell whether I have put too much or too little grease, and add ley or grease as the case may require. In two or three weeks it becomes excellent soap. We call it the cold process.—In this way we make better soap, get rid of the trouble and risk of boiling, and can make it as suits our convenience, or occasion requires.—And I wish, my dear that you would write to Mr. Skinner and tell him from me, that it is true. And besides, you have not written to Mr. S. for a long time, and he is very kind and attentive in sending you valuable seeds—and moreover, we hear that he is sick—and I should be glad to hear that he is getting better."

I forthwith sat down, and have given you her own words, as many of which she says you are at liberty to use, as you may think necessary to support or confirm the cold process of making soap.

A Frenchman, named Jaques, is now exhibiting himself at Belfast, Ireland, whose dimensions are as follows: height 7 feet 4 inches; round the chest 4 feet 3 inches; round the arm, under the elbow, 15 3-4 inches; round the wrist 9 1-2 inches. The span of his hand, when expanded on a table, is 13 1-4 inches; and the distance betwixt the extreme points of the middle fingers of his right and left hands when his arms are extended along a wall, is 7 feet 8 inches. His foot is 14 inches in length. He has not much flesh on his bones, and yet he weighs 24 stone.

Extract from the Message of his Excellency Governor MORRIS, to the Senate and House of Representatives of New Hampshire, delivered at the commencement of the present session.

"It is a pleasing circumstance, that the agricultural interest has been neither overlooked nor neglected by our Legislature.—We have sufficient reason to believe, that the measures adopted for the encouragement of Agriculture, have fully justified the patriotic views, and answered the most sanguine expectations, of those who suggested them. The institution of an agricultural board, with power to receive and communicate useful information and improvements, will always be considered an important era in the history of our State. The organization of county societies and their consequences, afford the most abundant proofs of an unrivalled spirit of emulation and exertion. The extensive interest which these measures have created, and the extraordinary benefits they have produced, may be inferred from the respectable associations of scientific and practical men, the numerous collections on our annual shows, the improved quality, and increased quantity of the commodities presented, and crops produced, together with the avidity and zeal with which competitors present their respective claims for premiums.

"As agriculture is the source of our subsistence, the basis of our strength, and the foundation of our prosperity, it is peculiarly gratifying to observe the public attention awakened to its importance, and associations generally forming to cherish its interests. No one can be indifferent to the advancement of that mode of cultivation, which produces the greatest possible quantity, at the least comparative expense. If not the exclusive duty, it is certainly the peculiar province of the State Government to superintend and promote the interests of the Farmer."

A METHOD OF RAISING EARLY CUCUMBERS.

By RICHARD VACHEL, Esq. F. H. S.

From the Transactions of the London Horticultural Society.

My gardener, John Farrell, having succeeded so well this season in raising early cucumbers, by an easy method, which I have not before seen practised, I herewith send you an account of his plan.

Instead of a bed of dung, put together in the usual manner, he formed a bed of faggots (sticks of wood) four feet high, laid as even at the top as the wood would admit of, and round the faggots he drove stakes to prevent them from slipping; on the bed thus formed he placed some straw and long litter, then fixed the frame. Over the straw some old tan, which, had been used in the pine pit was spread, in order to prevent any steam rising through the bed, and on the tan he placed the mould in which he placed the plants. The bed was surrounded by linings of hot dung, nearly to the height of the lights, and these were removed as often as the declining heat required.

Under this method, cucumbers were cut on the 22d of February, and I have been constantly well supplied with them ever since. I consider this plan much superior to the hollow brick-work recommended by Macphail.

The editor of the Troy Sentinel in speaking of high pressure steam engines, says: "We applaud the zeal with which the New York editors have come out, in solid column, against these perilous machines. We should much prefer going from Albany or Troy to New York, in 21 hours with our head on, unimportant as it may be to any body but our own, than in 14, with it off, body and all."

NEW ENGLAND FARMER.

SATURDAY, JUNE 12, 1824.

We have omitted the *Farmer's Calendar*, and some other articles intended for this week's paper to make room for notices and advertisements which could not well be deferred.

MR. BURRELL'S MACHINE. The "*Premium Clover Seed Machine*" of Thomas D. Burrell, Esq. which is described and recommended in our advertising department of this day's paper appears to us to be a very useful implement. We have seen only a model, but that was sufficient to give us a most favorable idea of the machine, in which we think simplicity, ingenuity, and utility are blended in a manner, which fully justifies the recommendations of the respectable cultivators, who have given it the seal of their approbation. Clover is undoubtedly the first of grasses, and probably has done more towards fertilizing our lands, and improving American husbandry than any other plant. But the difficulty of cleansing the seeds from the chaff or husks and separating the light, and unsound from those which were best fitted for vegetation has presented a very formidable obstacle to its cultivation. This difficulty, it appears to us, is completely surmounted by Mr. Burrell's machine; and its inventor has rendered very essential service to American agriculture.

NEW SYSTEM OF SHOEING HORSES. A valuable work on this subject has been published in Boston, which ought to be in possession of every person who owns the noble animal of which it treats. It is entitled "*New System of Shoeing Horses*, abridged from the works of Joseph Goodwin, Veterinary Surgeon to His Majesty, George IV. and Member of the Royal College of Surgeons. Containing a Comparison between the English and the French Methods, and Observations on the Diseases of the Feet, connected with Shoeing. To which are added Observations on Bleeding and the Pulse; a concise View of the Anatomy of the Foot, Notes, Remarks, &c. Ornamented with Cuts. Wells & Lilly, 12 mo. p. p. 140.

We have heretofore expressed our high opinion of this Treatise (see N. E. Farmer, vol. i. pages 142, 199,) and shall only add that the Author is eminent for his scientific acquisitions, and that his opportunities for information relating to the subjects of his Essay, have been such as no person in the United States, and very few persons in any country have ever enjoyed.

This work may be had at the Agricultural Establishment, No. 20, Merchants' Row, and at any of the principal Bookstores in Boston.

FOREIGN.

By the ship Lucilla, Capt. Chandler, arrived at Boston on the 10th inst. London dates to the 16th of May have been received.

An attack on Algiers was in contemplation by the British, but not by an united force of ships. If the Bey should remain obstinate, the attacks will be made on the Town and Fortifications by the employment of bomb and mortar vessels.

The London Courier of the 10th of May says, "that

letters from Madrid of the 26th, speak of a levy of 56,000 men in Spain, part of whom are to be employed in attempting the re-conquest of the American possessions, but as money is wanting, it is said that an application will be made to the Philippine Company, which has money in its coffers."

LONDON, May 7.—Mr. Canning, last night, stated that he had received the most satisfactory explanations from the French Government respecting the alleged naval force at Brazil. They had accounted for every ship of war that had been sent out of the ports of France, and shewn their various destinations. Instead of eight, there were only two French men of war at Rio Janeiro. Mr. Canning further observed that, "although not the slightest ground existed for apprehension of any kind whatever, there was no naval situation in the world on which the force of the country did not completely out number that of another."

We have received this morning letters from Corfu and a file of the Greek Chronicle, published at Missolonghi, to the 27th February. We are glad in our numbers to see the fullest confirmation of the recovery of Lord Byron.

Piracy still continues on the coast of Cuba. The schooner Florian, of Warren, and schooner Alpha were captured off Matanzas the 10th ult. by launches.—While the pirates were unloading the Florian, the Alpha escaped into Matanzas, from whence the Sea Gull sailed in pursuit of the launches, recaptured the Florian, and took a lighter with three men. How the acts of robbery can be perpetrated at noon-day in sight of land, and only four miles from Matanzas, without implicating the vigilance or power of the Spanish Government, both of which have felt with sufficient energy and promptitude at Havana, is difficult to conceive.—Convenience is more than suspected from the authorities on shore.

DOMESTIC.

Caterpillars.—A letter written in Hartford county N. C. to the editors of the Norfolk Beacon, says that wheat crops have been much injured by the caterpillars—probably one half destroyed.—"After going through my wheat and eating every thing which it could eat, including many of the heads, in despite the united exertions of all my hands, for ten days ditching and ploughing deep furrows, and brushing a killing them, they ate about forty acres of my corn which was nearly knee high."

Transatlantic Shepherds.—A Shepherd, from 1 mountain of Thuringia, in Germany, accompanied a Shepherdess, and Shepherd's Dogs, have arrived at Charleston, S. C. and gone to the plantation of C. Breithaupt, in Edgefield District, who is about establishing a considerable sheep walk, for which the pi wood range is said to be peculiarly well calculated. [N. Y. Statesman.

Rumor, "with her thousand tongues," is busy proclaiming the existence of a "Silver Mine" in the neighborhood. Land on which the ore is found, has been entered within a few days, to the amount of 17 acres. We shall certainly be among those who rejoice at the discovery, if it be ascertained that this mine can be worked with profit. In the mean time we may reflect that "all is not gold that glitters," so it may be said with equal truth that *all ore does not contain Silver, though some shining substance may be extracted from it by means of fire.* Whatever the result may be it is certain that Uncle Sam has pocketed some \$200 by the sudden sale of land that is really execrable for the ordinary purposes of agriculture.—St. Louis paper.

Canal Revenue.—The collector of tolls at the mouth of the canal at Albany, received and paid into the State Treasury from the 5th of May to the 1st of June last, short 4 weeks, \$17,738.71.

Fatal Accident.—At Newton, L. Falls, Mr. Theron T. Reed, of Middleton, Mass. in attempting to pass over the Wheel House of Joseph Foster's Paper Mill the roof being very much decayed, unfortunately fell through into a wheel, under a full gate; passed und

the wheel and survived about fifteen minutes. He probably received his death wound by a blow on the head, though considerably injured in many parts of his body.

New York.—It is stated to us by gentlemen who have had particular enquiries, that there are now erecting the Eighth Ward in this city, about 1000 houses; and it is computed that the whole number of houses built at present season and now building in the whole city will exceed three thousand.—*Mex. Adv.*

Worthy of Imitation.—Gen. Robert Goodloe Harper, recently made a present of one hundred volumes of valuable books, to the Apprentices' Library Company Baltimore.

MASSACHUSETTS LEGISLATURE.

In SENATE—Thursday, June 3. Mr. Bangs, Secretary of State, delivered a Message from his Excellency the Governor, covering a letter from the Hon. James Lloyd, and sundry documents, relating to the conveyance under the authority of the United States, of Buzzard's Bay, and Earlsstable Bay, and of the land lying between them, to ascertain the practicability of connecting said Bays by a Canal. Referred to a Committee.

A Resolve passed both Houses for the pay of the members of the Council and Legislature, as usual. Amherst Institution.—The Joint Committee on this subject, reported leave for the bill, which was accepted without opposition.

Friday, June 4. A Resolve from the Hon. House, directing the mode of choosing Electors of President and Vice President was read and committed.

Saturday, June 5. This day was occupied in attending to private and local business. A remonstrance of the inhabitants of Roxbury against the grant of the charter of the petition for a bridge to South Boston was committed.

Sunday, June 7. A number of private bills passed and engrossed. The Resolve from the House directing the mode of choosing Electors of President, &c. by General Ticket was, after debate, passed. Yeas 18, Nays 17.

House.—A Committee was appointed on so much of his Excellency's Speech as relates to imprisonment for debt, to report at next session.

Col. Valentine on the subject of the returns of members, made a report, by which it appeared that the returns from several towns were incorrect as respects names. In some the notifications and summons from the courts did not appear. In some the year of our Lord, and of the Independence of the United States were omitted, &c. The Committee, however, reported that all the members returned, including those whose notifications were somewhat informal, should retain their seats.

debate took place on the subject of choosing Electors, but no decision was obtained.

Friday, June 4. The Resolves on the subject of the mode of Electors, by which the General Ticket system was adopted, after debate, was passed. Yeas 140, Nays 85.

The Report of the Joint Committee on the petition of the Trustees of the Amherst Institution, giving leave for a bill was, after debate, assigned to Tuesday next. Saturday, June 5. The Report on the Amherst Institution was ordered to be printed for the use of the members.

The different sections of the Governor's Speech were referred to Committees.

Sunday, June 7. A Committee was appointed to inquire what amendments are necessary in the laws relating to the restraining of vagabonds, idle and lewd persons, and to report, &c.

Resolve to authorize the purchase of a sufficient number of the copies of the recently discovered constitution of Gov. Winthrop's Journal from 1638 to 1679, the time of his decease, and to furnish each copy in the State with one copy was read and accepted.

Tuesday, June 8. A Committee was appointed to inquire into the expediency of altering or amending the law relative to compounding cattle.

The question relating to incorporating the Amherst Institution was taken up and debated, but without any decision.

PREMIUM CLOVER SEED MACHINE.

THE Subscriber has recently invented a new and simple mode of *hulling and cleaning* CLOVER SEED, by which the tedious, expensive and troublesome process now in use is entirely avoided. The MACHINE for the purpose combines great lightness and simplicity, with strength and durability. Its originality and the astonishing rapidity with which the seed is cleaned, depend chiefly on the use made of the currents of air raised on the face of a revolving cylinder armed with iron teeth. By a very simple arrangement the chaff, containing Seed, in passing over the cylinder, is winnowed, and all the light chaff, leaves, dust, &c. are blown away. It then falls into the bed of the Machine, where the Seed is whipped out lightly, without rubbing or grinding. When separated from the hull it falls through a screen into a fan, while the chaff is carried over the cylinder and discharged. In this way most of the uncomfortable dust of other machines is avoided, and the hull is merely broken, but not reduced to powder; the Machine is kept free from clogging, works with a light and even motion, and requires much less power than any other now in use. No heat is raised, and no seed is wasted or injured.

A number of these Machines have been in successful operation the past winter, and have fully shown their decided superiority over every other mode, by their admirable style of performance. Rights for sale, and Machines furnished on liberal terms.

THOMAS D. BURRALL.

Geneva, N. Y. March 30, 1824.

RECOMMENDATIONS.

The Committee of the Agricultural Society for awarding the Premium on the best Machine for Thrashing and Cleaning CLOVER SEED, have awarded said Premium to Thomas D. Burrall, Esq. of Geneva.

The Committee are unanimously of opinion, that Mr. Burrall's Clover Machine, with reference to the moderate expense of building, durability, the power required to work it, the quantity of Seed cleaned in a given time, and the style of performance, is decidedly superior to all other Clover Machines with which they are acquainted.

H. B. GIBSON,
NATHANIEL JACOBS,
CHARLES W. HENRY,
ANSON MUNSON,
Z. BARTON STOUT,
MARK H. SIBLEY,

Committee.

Annual Fair, Canandaigua, Oct. 20, 1823.

We hereby certify, that we have examined Mr. Burrall's Machine for Hulling and Cleaning Clover Seed, and have seen it in operation by horse power. Its motion is light and smooth, and it cleans with ease rising of one and a half bushels per hour. The work is perfectly well done: no seed is injured or wasted. It is simple and durable, and we think it decidedly superior to any other Machine for the purpose with which we are acquainted.

ANTHONY D. SCHUYLER,
JOHN B. RUMNEY,
GEORGE GOUNDRY,
ANDREW MNAB.

Geneva, Oct. 20, 1823.

The Subscriber has pleasure in adding his testimony to the merits of the Clover Thrashing Machine invented by Thomas D. Burrall, Esq. of Geneva. He has no hesitation in saying that he considers it preferable to any Clover Machine now in use, and that it is calculated to be an important aid in advancing the interests of the agricultural community. NATHANIEL ALLEN.

Richmond, Oct. 29, 1823.

I hereby certify, that in December last, I purchased of Thomas D. Burrall the Right of using his newly invented Machine for Cleaning Clover Seed, and put one in operation in the town of Junius, about the 1st of February last, in which I have cleaned rising Five Hundred Bushels of Seed. No Seed is injured or wasted, and a Ton of Seed may be cleaned in twenty four hours with the power required to run a Carding Machine. The Machine is simple, and not liable to get out of order, and I think it superior to any machine for the purpose with which I am acquainted.

Junius, March 20, 1824. JACOB KISTLER.

I hereby certify, that I have been employed since July last, in building Mr. Burrall's Clover Machines, and have since that time put several in motion by wa-

ter and horse power, which have been in constant operation through the past season. I am acquainted with several other modes of Cleaning Seed, now in use, and have no hesitation in saying that I consider Mr. Burrall's as greatly superior to any other which I have ever seen. It is less expensive, requires less power to drive it, and less labor to tend it; it is not liable to get out of order, finishes its work at a single operation, cleans more Seed in a given time, wastes nothing, and above all, raises very little dust, as the Seed is whipped out lightly, without grinding the chaff to a powder.

Geneva, March 26, 1824. JEHAI F. AXTELL.

The Subscriber has tended one of Mr. Burrall's Clover Machines for about three months past, driven most of the time by two horses, though occasionally by one. It works perfectly well, is easily tended, and raises but little dust, as the chaff, as fast as it is cleaned, falls through a trunk or case to the outside of the building. It cleans on an average from three pecks to a bushel of Seed per hour, but with good chaff will do much more. It has needed no repair, and is in as good order as when first put in operation. ODELL ATFLLEY.

Geneva, March 26, 1824.

JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Manure FORKS. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warranted cast back do, Bisbee's cast steel polished Shovels— altogether with a great variety of other agricultural implements. June 12.

PROGRESS OF LIFE.

As through the shadowy silence of the groves,
The water'd valleys and the green retreats,
The gentle brook with languid murmur roves,
Ere yet its secret journey it completes,
Winding its devious current, pausing plays
Through fields of verdure, still delights to creep,
Until, with step precipitate it strays
To plunge into the bosom of the deep;
Through silent paths so may my varying life
Pass gently on,—to wealth no sordid slave;
Unknown the wrangling bar's tumultuous strife;
Unknown the blood stain'd honors of the brave;
And when I've reach'd mild evening's placid gloom,
With pleasure sated, or with toil oppress'd,
May Sleep's calm brother, in the silent tomb,
With his cool hand compose my limbs to rest.

EPITAPH.

What thou art reading o'er my bones,
I've often read on other stones;
And others soon shall read of thee
What thou art reading now of me.

Miscellany.

WINDS, &c.

Frommond relates extraordinary things of the south wind when it blows in the Azores. "The inhabitants," says he, "then go about as melancholy as if some great misfortune had befallen them. The little children stay within doors quite dull: none of them are to be seen running about and playing in the streets. But as soon as the north wind begins to blow, all is once more life and bustle." In Persia there are winds, which pass over heated rocks and marble mountains, and carry along with them hot and sulfating vapors. To avoid their dangerous effects, people are obliged to lie flat on the ground, and in that situation to endure heat and anxiety, if they would not drop down dead on the spot. It is only in the night time and on rivers that they are able to withstand it, and for that reason the Persians are not fond of travelling by day.

An artificial wind may be produced by opening doors and windows standing opposite to each other in an apartment. In such cases a person should not expose himself, especially when heated by exercise to the current of air, without due precaution. He should either move about to keep up the insensible transpiration or shun the draught by retiring into a corner. With these precautions a draught of air in rooms is not only innocent but salubrious.

A private letter from Africa states, that the celebrated traveller, Barzoni, died at Benin, of a dysentery, after a few days illness. Mr. B. was attempting to reach Houssa and Timbuctoo. At the time of his death he had every thing arranged with the King of Benin for his departure, and had his health continued, there is no doubt he would have succeeded. Mr. B. passed at Benin as an inhabitant, or rather a native of the interior, who had come to England when a youth, and was now trying to return to his country. The King and Emegrands (or Nobles) gave credit to this, Mr. B. being in a Moorish dress, with his beard nearly a foot in length. There was, however, some little jealousy among them, which was removed by a present

or two well applied; and the king of Benin's messenger was to accompany Mr. B. with the King's cane, and as many men as were considered necessary for a guard, and baggage carriers. The King's name is respected as far as Houssa, and he has a messenger, or ambassador, stationary there. On Mr. B.'s arrival at Houssa, he was to leave his guard there, and proceed to Timbuctoo not being known at Benin. On his return to Houssa, he would make the necessary preparations for going down the Niger, and despatch his messenger and guard back with letters to his agents and Mr. John Houston. The messenger to be rewarded according to the accounts the letters gave of his behaviour, and the King to receive a valuable stated present. This was the plan, and I think it would have proved fortunate had Mr. B. lived.

English paper.

Blind Dog.—A lad was recently passing over Deering's Bridge, when a sudden gust of wind took off his hat and carried it some distance into the water. The wind and tide were sweeping it rapidly down the bay, and the boy stood gazing upon the scene, and lamenting his loss with tears; when Mr. Winslow chanced to pass that way with a dog which was *totally blind*, by whose assistance he undertook to regain the hat; which he effected by throwing stones into the water in direction of the hat. The dog plunged in, and, guided only by the noise of the stones striking the water, swam off and took the hat into his mouth and brought it safe on shore, to the no small gratification of the lad and other spectators.—*Portland Argus.*

Dueling.—A duel was lately fought in New Orleans, where the parties, to speak in terms of honor and chivalry, were on a *footing*. One was a *sexton* of a burying ground, the other the assistant *grave digger*. The ball of the sexton grazed the thigh of the grave digger, whose honor not being satisfied, and who had often faced death with impunity, insisted upon another shot, and the sexton, lucky dog, plumped the grave digger in the thigh bone, which shattered his understanding, but it is not known whether the wound demanded a cast of his own office. The dispute was perfectly in character; it was about grave digging; appropriate and solemn.

National Advocate.

The antiquity of the husbandman's art is not to be contested by any other. The first three men in the world, were a gardener, a ploughman, and a grazier; and if any man object that a second of these was a murderer, I desire he would consider, that as soon as he was so, he quitted our profession, and turned builder—

"God the first garden made, and the first city Cain." We may talk what we please of lilies and flowers rampant, and spread eagles, in *d'or* or *d'argent*; but if heraldry were guided by reason, a plough in a field arable would be the most noble and ancient arms.—*Cowley.*

"A View of all the known Languages, and their Dialects," has been lately published by a Russian author. They amount to 3,014, classed as follows: 237 Asiatic, 587 European, 226 African, 1261 American.—*Lit. & Econ. Mag.*

Who could expect it!—Last Monday, 50 crates of crockery were from Liverpool, arrived at Utica without having been landed on its passage.

N. Y. Statesman.

ANECDOTE.

Some time since a certain lord, in Ireland gave a grand gala to the members of the volunteer corps in the neighborhood, all of whom attended in full uniform. Among others, his lordship's tailor was present, and the host came up to him, saying "My dear Sir, how d'ye do I beg your pardon, I forgot your name, but perfectly remember seeing you somewhere before." The tailor was a little confounded by his particular notice, and as the best way of making himself remembered whispered, "made your breeches." The noble lord, thinking the tailor had informed him of his name, turned round and took him by the hand "Major Bridges, I am very happy to see you."

NEW ENGLAND MUSEUM.

76, COURT STREET, BOSTON.

CONTAINING much more numerous Collection and greater variety of entertainments than any other Establishment in America, continues steadily increase, and is open for the reception of visitors

EVERY DAY AND EVENING.

It will be constantly in the best possible condition, and every exertion made to render the visits of its patrons agreeable.

This Establishment now contains FIVE former Museums united in ONE, together with very great numerous additions (the whole receipts being faithfully laid out to increase it.)

JUST ADDED.

The celebrated Race Horse Eclipse, A beautiful Cosmorama View of London, A large and beautiful live Rattlesnake, The Arabian Bottle, made of the stomach of a Camel—holds about a barrel—used to carry water across the desert.

The fatal Chair—very ingenious—invented by Professor Pock.

A very large and elegant Sword Fish, upward of 14 feet long, with a sword 1-2 feet long.

The Museum is well lighted, and a Band Music performs every evening. Admission 25 cents. Just 5.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vend LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row a supply of different sizes and thickness. The main in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

ENGLISH BREED OF SWINE.

Sm.—In a note appended to a communication by "A Farmer," you have referred to a paper written by me, and originally published in the *py*, recommending the breed of hogs known as the *English Whites*, *English Broad Backs*—or from the nobleman who introduced them in England, the *Bedford breed*. Their qualities under these different denominations being so much the same, induces the belief that they are all of the kind.

From my agency in obtaining them; and as my opinion of their superior value has been confirmed rather than diminished, I feel it a duty to attempt to justify my former statement; and to protect a meritorious class of animals from an exterminating reprobation.

Having viewed Mr. Reed's piggery in Roxbury a few years since, and seeing this breed of pigs in all stages of their growth, and learning their character, I was satisfied that I should do essential benefit to the farming interest in this section of the country by having this kind introduced. For this purpose I made a purchase. At about a year old they were exhibited at our Cattle Show. As they had been bred up for breeders, they did not show to the best advantage. The Committee commended their form and proportion; but expressed a doubt whether, in their native state, they would attain to the most profitable size. Under this impression they recommended crossing with a coarser breed." To ascertain this important point, I wrote to Mr. Reed. He was then largely engaged in supplying the market with pork: and doubtless was conducting this business with great economy as to cheapness and quality. An extract from his letter I subjoined to my publication in the Spy, which, as republished in your paper, appears as the result of my experience. The fact is, I have never raised one to maturity. Their frame has been so great, that my medical supply has always fallen short of the demand. The present season I could have disposed of more than double the number on hand. In object in having them extensively spread, and now obtained, I shall be able to give the result of my own experience; as I have two which I have reserved for fattening, which propose to corroborate, if not to exceed Mr. Reed's statement.

The following facts will show how highly the "famous breed of hogs" has been estimated and how far according to the statement of our correspondent, "their credit is sinking in its vicinity." At our Cattle Show in 1822, a year after mine were exhibited, the two best boars in the pens were of this commixed blood. Both would have obtained a premium. It has been within the rules of the Society to put one for the best and next best. A native breeding sow, ordinary in herself, received the premium on account of her fine, *half blood*, pigs. The boar and breeding sow which obtained the premium last year, from the judgment of the

Committee on swine, to whom "much credit is due for their decision," were the offspring of an "English" boar. The pigs exhibited by Messrs. Ward & Rice, of this town, which gained the premium, were in part of this breed.—The largest and best formed fat hog ever seen in the pens was of this clear breed. He was the produce of my animal, which a Committee, as above stated, advised to be crossed with a coarser kind. This hog was exhibited by Major Bart, and weighed a few weeks after at two years old, a few pounds short of 600 weight. Will your correspondent engage to make one of his "old sort" weigh 100 lbs. more than this? Thus far for their credit at our public exhibition.

I will now state the practical opinion of some of our best farmers on the subject. Mr. R. Porter who rears more hogs with less expense than any other farmer in town, is wholly confined to the "English breed," which he originally had of me. S. Flagg, Esq. informs me that the best and most profitable hogs he has ever fattened are the descendants of my stock. He is careful to obtain his pigs of this kind and markets them at from 9 to 12 months old, when they weigh from 240 to 350 lbs. He has never kept any after a year old, as they fat so fast and easy, that at this age they are as large as his customers wish; and he is unwilling to incur the risk of keeping them, particularly through the hot season. Major Burt had three slaughtered last year at eleven months old, two of which weighed 340 pounds each—the other 329 pounds.—Another of the same litter, sold to a neighbor, weighed at the same age, 323 lbs. Mr. Lutman, another of our intelligent and attentive farmers was among the first to procure this breed from my pen. He continues the kind and thinks them superior to any he has ever before raised. He has had three slaughtered at 11 months, which weighed upon an average 335 lbs. He has taken three from my pen this spring, less than he would, but all I could spare.

The above are some of the notorious facts respecting this breed of hogs which I very easily obtained. In view of them, is it credible, that "a farmer can obtain, with the same expense of keeping, "five dollars" advantage, at any age he chooses, in favor of his "old sort?" I am confident of the fact, that there will be five dollars difference—but the odds will be against him.

I have been more particular on this subject from the consideration, that the greatest profit which accrues to a farmer in obtaining a necessary article for his family and the market, is derived from a judicious selection. The kind of hog seems to be as various as the canine race—and most of them as unprofitable. What *runts* have been imposed on your correspondent and his neighbors under the denomination of the "English breed," it is difficult to conjecture.—They may be *hogs*; but from his description of them they have no affinity with those which I have the satisfaction of having introduced as this breed; and whose value, with our best farmers, is increasing in their estimation. There may

be another kind under this denomination. On this I am ignorant. If so, the writer, after having seen your editorial remark would have adverted to the fact; and probably softened his malediction. But however great his prejudice, should he chance to have an interview with *my family of this description*, I doubt not he will feel impelled to give them gentlemanly satisfaction for having publicly traduced their character.

I have given names and facts to substantiate my statement. If "A Farmer" will do this, and thereby demonstrate that his "old sort" is best, I shall very readily yield to the evidence; as I have no predilection for any kind but the most profitable. I have however never yet seen the equal of the "English breed" for their propensity to fatten—but particularly for their great excellence in the proportion of flesh to offal and bone. We doubtless have as good native hogs, and they might be as valuable with the same care as has been bestowed on this race.

Respectfully yours

O. FISKE.

Worcester, June, 1824.

THE SEASON.

To the Editor of the New England Farmer.

Sir,—It may be beneficial to agriculture if the subscribers in different parts would, generally, communicate their observations on the seasons and the effects on produce, &c. I may begin by stating that, at this place, we had a mild, open winter, but little snow, the least ice in the river ever known, and the snow gradually wasted without much rise of the waters.

During the month of April the season appeared very forward, and the weather mild and promising; only the winter grain, in general, very much hove out and dead. Many farmers ploughed up their rye and sowed oats.

May was colder than April—we had a sufficiency of rains; they were of the cold easterly kind. All kinds of vegetation appeared suspended until about the 20th, when it moderated so that the fruit trees began to put out, as also the forest trees. The mornings of the 24th and 25th, we had some little frost that was generally taken off with the fog before the sun shone. Our orchards and fruit trees in full bloom. In the afternoon I could not perceive the blossoms to be damaged. In the night there came a cold squall from the north, and in the morning of the 26th the ground was white with frost; I could perceive the top of mellow ground to be frozen, and found ice as thick as window glass. The frost lay some time after the sun shone out. Next day the blossoms on the apple trees appeared all wilted, and turned of a brown color. I think that our fruit of all kinds is entirely killed for the frost was so severe as to kill all the leaves and buds on the white oak and chestnut, but not on the maples. It also killed such flax as was up but not the oats. My garden was not up except peas, salad, radishes and cabbages. Those it did not hurt unless by giving the ground such a chill as to check the growth of every kind of vegetation. My situation, seven miles S. of N. latitude

ude 42 deg. and on the bank of the Delaware where it is from 100 to 200 yards wide.

As this severe frost came with a sudden squall with a dark cloud and some sprinkling of rain from the north, I wish to hear from the several parts of New England and Vermont. Has the frost been generally so severe or are we to suppose that the winds in passing some high lands mounted those clouds so high in the cold atmosphere as to generate the frost, as hail storms are frequently generated in hot weather—and that as the cloud was driven with the wind it scattered its contents that were perhaps also attracted by the water in the river.

The observations of any gentleman on this subject will be very acceptable.

SAMUEL PRESTON.

Stockport, Pa. June 5, 1821.

BEST TIME FOR CUTTING TIMBER.

To the Editor of the New England Farmer,

SIR,—Learning from a late number of your paper, that the month of June is the most proper time for cutting timber, with diffidence I would ask permission to make a few observations on that subject, without wishing to enter into controversy with any, but rather to promote enquiry.

The arguments adduced in favour of felling timber in June are not conclusive. From thirty years personal observation, I find it depends, in a great measure, on the quality of the timber. Some young growing timber, will perish sooner than that which is older and more ripe; and secondly it depends much on the use it is put to. We will suppose timber of the same quality wrought into two waggons, one of them when used is loaded with wet loading, the other with dry, it is obvious which will perish first. I trust I shall not be charged with egotism, by those who know me, when I say that I have wrought more kinds of timber than most men have, and for more uses than any I know of, and it has been my endeavour to determine what time for felling and what kind of timber is best for the use desired. And from the many observations I have made from both, I am satisfied and ready to say, without hesitation, that September is the best time, although I believe, that if the bark of timber trees could be taken off in June, without felling the tree or injury to the wood, and then let stand until September, the timber would be stronger and more durable. I have seen this done to elm, walnut, and maple. (I have made use of the common name of timber without giving their class, order or genus, because we should be less liable to mistake.) All these are considered of the most perishable kinds that are made use of for timber.—All of them proved to be more firm and lasting. I have seen white oak timber felled in February and March, the sap of the wood was perished September on one side of the logs. I have seen wood, cut in May and June, in which more than the sap of the wood was perished in one year. I have seen timber that was cut in September that the sap was perfectly sound and bright two years afterwards. I have used white maple for hoops to buckets that was cut in September that lasted 21 years in constant use, the first ten years for water, the remainder for feeding of swine. I have one now that was hooped with maple that was blown down in the September gale 1815, which is perfectly sound. I

have one other that I put but one maple hoop on of the same kind, the others were of walnut cut in the winter; the latter I have had to replace three times, once with walnut, once with white ash, and once with red ash. The maple is perfectly sound now. Many reasons may be offered why September is the best time for felling of timber, but one general reason must suffice for this time. When I have more leisure it may be that I will discuss it at greater length. The one reason I shall now offer is, the timber is more ripe in September than at any other time. I have thought that making these suggestions at this time, might induce some to try the experiment this season of removing the bark from trees designed for timber.

Yours, &c.

PHINEAS STEVENS.

Andover, June 4, 1824.

THE BORER IN APPLE TREES.

To the Editor of the New England Farmer,

SIR,—If you think the following, worthy a place in your useful paper, you will confer a favor on one of your readers, by inserting it. AGRICOLA.

Having been recently employed, in the examination of a considerable number of apple trees, for the purpose of exterminating that destructive insect, known by the name of the "Borer," I was surprised to find it apparently in so many different stages of existence. I discovered first, a small substance on the bark of the tree, scarcely possessing the power of motion; second a small grub, or worm between the bark and wood, generally, very near the surface of the earth; third, a larger worm completely incased in the wood of the tree, from one to four inches from the surface of the earth; fourth, an insect about one inch and an half in length, with many legs, and apparently a pair of wings, from four to six inches from the surface of the earth, and near the inside of the bark of the tree. I indulge the hope that some of the correspondents of the New England Farmer, may be able, and willing, to answer satisfactorily, the following queries, viz.:—Does the borer spring from an egg deposited on the bark of the tree? (if this is the case) what insect deposits the egg? and at what season of the year? How long is the egg in hatching? How many months or years, does the insect live in the tree? and does it leave it in any particular month? Has any method been discovered, to destroy this mischievous insect except by cutting it from the tree? The writer is confident that if any person possesses the means of answering the above queries, by so doing, he will confer a great benefit on all those who cultivate the apple tree.

R. . . . y, June 3, 1821.

From the Old Colony Memorial.

MORE RESPECTING FRUIT TREES.

In the perusal of the New England Farmer, for weeks past, my attention has been particularly arrested by numerous communications and remarks on the subject of fruit trees, and the various tribes of insects by which they are infested: The subject is far from being exhausted: we are still deficient in many particulars in which the cultivator of fruit is peculiarly interested. It is matter of regret that those who undertake to communicate information, should disappoint expectation through a want of spe-

cific or discriminating language. If we are told that a certain remedy will cure fever, it should be deemed worse than quackery unless we informed in precise language the species, the type, and particular stage of the disease in which it will prove efficacious. The terms, caterpillar and worms, are not unfrequently employed synonymously, although, of both species, there are numerous varieties. They differ very essentially in their physical peculiarities, and an antidote which will prove fatal to one description, will be found altogether innocuous when applied to others. When therefore a new process is recommended, it is undeserving of confidence as it imparts to us no practical instruction unless the particular species of reptiles is designated. If it be desirable to combat that unfounded aversion which our farmers manifest to all information derived from books and newspapers, we should be extremely cautious how we shake their confidence by seducing them by fallacious statements instead of substantial facts. It has been recently announced in several papers that successful experiments have been made by the introduction of sulphur into the trunks of trees for the destruction of caterpillars and a writer has cited an instance of an elm tree in the city of Albany. When greatly annoyed and decayed an anger hole was bored in to it and being filled with sulphur the reptile were in forty-eight hours all destroyed, and the writer avers, that when fruit trees were the subjects of the experiment it was attended with the same result. There is in the last number of the New England Farmer an article copied from the Hartford Mercury, asserting, that when sulphur is introduced into trees, the worms will in forty-eight hours leave the remote branches, and adds that the process will prove infallible. What were the particular species of worms thus destroyed we are left to conjecture, and the mystery of the novel process in nature is a subject for philosophical investigation. The sulphur being introduced into the trunk of the tree must be absorbed by the sap vessels, and its fumes be diffused through the numerous ramifications until the leaves become so strongly impregnated with noxious qualities as to poison the insects which feed on them, or they must be destroyed by the sulphurous fume exuding through the pores of the bark when exposed to the purifying influence of the atmospheric air. It will require repeated ocular demonstration to enforce conviction of the reality of such phenomenon. Accordingly I have lately had recourse to the following experiment. Early in May, when caterpillars had attained to about on third their natural size, I selected a nest on branch of an apple tree and eight feet below the nest I bored a hole about two thirds through the main branch being about 5 inches in diameter which I crowded more than a spoonful of flour of sulphur and plugged up the hole. In forty eight hours after, I visited the object of my curiosity and found that not a single reptile had received its quietus. I left them to the influence of the drug four days longer when finding the whole tribe in their active gambol increasing in size in defiance of my experiment, I opened the nest and dispatched the inhabitants. A few days after I observed that a new nest had been constructed on the same branch by a few of the tribe which had escaped my vigilance. In about 16 days I bored out

the plug and found the sulphur not diminished in quantity, but rather increased in its odour, from confinement. As the result of this experiment did not diminish my incredulity, I selected another nest which I opened and filled with sulphur and having wrapped a covering of paper round the nest to confine the insects I left them completely enveloped and exposed to the full force of the noxious drug for about twenty-four hours when finding them in the enjoyment of perfect health and vigor, I subjected them to the fumes of burning sulphur, to which they did not yield until scorched by the laze. This closed my experiments and confirmed my scepticism. We may now appeal to the writer of the article in the Hartford Mercury for a reply to the following queries.

1st. At what season of the year was the experiment made?

2d. What species of worm were the subjects, the apple-tree caterpillar, by some called web-worm (*Phalæna neustria*) or the canker worm *Phalæna Vernata* Peckii*) or the cherry and lumb tree weevil (*Rhynchaneus Cerasi*)?

3d. When the worms were observed to abandon the trees, were they examined to ascertain whether they were actually dead?

If the fumes of sulphur will, through the medium of the circulations in the tree, destroy the kind of worms it may be supposed to prove fatal to other insects and the discovery must be considered as highly important. But for the destruction of the common caterpillar, we need not the aid of a single point in philosophy, nor even the semblance of mysterious operation, since by a little attention and industry we may annihilate the whole tribe. We have only to sit our orchard once in three or four days during the month of May, when they are just reeping into existence, and crush with the fingers or otherwise, those within reach, and to employ Pickering's brush for those in high situations and nothing further will be requisite. The reader will find in the American Orchardist further particulars relative to this subject.

JAMES THACHER.

Phymouth, May, 1824.

*The term *Peckii* was added in honor to that industrious and eminent naturalist, the late Professor Peck.

GARDINER LYCEUM.

For the accommodation of those, who cannot, on account of time and expense, attend the Lyceum in the regular classes, the Trustees are voted to establish Winter classes, which will commence the third Wednesday of November annually, and continue till the close of the spring term in the April following.

The classes of this kind, which they at present contemplate, are 1. A class in *Surveying*;—2. In *Navigation*;—3. In *Carpentry and Civil Architecture*; and 4. In *Chemistry*. The following is the arrangement of the studies of each class.

1. In *Surveying*, Elementary problems in Geometry.—Trigonometry with its application to Heights and distances.—Different methods of making Surveys.—Protracting.—Division of Land.—Levelling.—The principles of Magnetism, so far as is necessary for understanding the variation of the Compass, and those circumstances which are likely to affect the traversing of the needle.—This instruction will be

accompanied by *actual practice* in surveying and levelling, for which purposes the Lyceum is provided with excellent instruments.

2. In *Navigation*. Elements of Geometry.—Trigonometry, with its applications.—Logarithms.—The different sailings.—Nautical Astronomy with *solar and lunar* observations, taught by *actual practice*.—Elements of *Magnetism*.—*Book-keeping*, which is indispensable to those, who unite the character of Supercargo with that of Navigator.

3. In *Carpentry and Civil Architecture*. Elementary problems in geometry.—Measuring of timber, carpenter's work, &c.—The principles and practice of drawing *plans, sections and elevations*, and of drawing in *Perspective*. The principles of Equilibrium, with the strength and pressure of timber and other materials, and the construction of *Roofs, Frames and Arches*.—Drawing the five Orders, and the principles of Grecian, Italian and Gothic designing.

4. In *Chemistry*. This class is designed for those, who wish to obtain a knowledge of chemistry, as a branch of liberal science, or as introductory to a more thorough understanding of some of the useful arts, as Agriculture, Dyeing, Tanning, &c.

Other winter classes may hereafter be formed. A student in either of the above classes may attend the recitations of any other class, when it can be done without interruption to his own studies.

The time allotted to the above classes is thought by the Trustees to be as short as would be advantageous, and they recommend to those, who design to attend them, to enter in August, when it can be done with convenience, and to pursue the regular studies till November, which will facilitate their winter studies.

The fees of the above classes will be \$10 for the whole course. The members of them will attend *gratis* all lectures relating to the branches which they study.

All that will be required for admission, is such a knowledge of Arithmetic, &c. as may be obtained at town schools.

Lectures on Chemistry and its application to the useful arts will be delivered at the Lyceum, during the next winter; and part of the course on Mechanics. To these, persons not connected with the Lyceum will be admitted.

The next academical year at the Lyceum will commence August 25, 1824. Candidates for admission will be examined in the fundamental rules of Arithmetic, and in English Grammar. Besides the studies already advertised, appropriate instruction will be given to those, who design to be merchants.

BENJAMIN HALE, *Principal*.
Gardiner, Me. May, 1824.

From the American Farmer.

Albany, May 15.

DEAR SIR,—I inclose a meteorological table for the last year, and have added such notes of the vegetation in April and May, as my notes afford.

Yesterday we had flurries of snow at intervals all day, with strong N. W. winds. The thermometer in the afternoon was at 33½ in the house, and this morning before sunrise at 31 in the open air, 1 degree below freezing—and yet, on account of the wind, I am in hopes our fruit is not

destroyed. Vegetation is at least seven days earlier than last year; and I have had rye in head some days.

I have now, and to me sufficient evidence, that liming seed wheat, is a preventive of the fly as well as of smut. The experiments of G. B. Everson, of Poughkeepsie, and of Col. Mather, of Scaghticoke, both intelligent, observing gentlemen, have removed all doubts in their minds. And Gen. Armstrong, as follows:—

"Liming seed to prevent smut and other similar maladies, has been long practised in Europe. I think I notice it in the Practical Farmer; but whether or not, I have seen it used in this neighbourhood, on a suggestion of mine, and with the effect of completely protecting the crop from the fly. My son, Col. H. B. Armstrong, was the experimenter—limed one half his wheat seed, and sowed the other half without liming. The former had no fly—the latter was devoured by it."

Yours with esteem,

J. BUEL.

A great Convenience.—We have heretofore advocated the offering of a premium to the inventor of the best contrivance for transporting fresh butter to market, from any distance, by land or water.—This desirable object has now been accomplished by Mr. Richardson, at his shop in East Street, where he makes and sells, at various prices, from \$10 to \$15, according to size, butter boxes constructed on the principle, and somewhat on the plan of his excellent Refrigerators, some of which on the most improved plan are now for sale.

These Butter boxes are so compactly arranged, as with a small quantity of ice, to bring the butter to market in the best condition, and without injury to the form of the prints. Where boxes are bespoke, the diameter of the print in use, ought to be given.

Every new facility of this sort, while it enables farmers more distant, to avail themselves of the benefit of the market, at the same time increases competition, and reduces the cost to the consumer of the article—and is therefore an object of public utility.—*ibid.*

Dr. Mitchell received, a few days ago, a valuable collection of seed, from General Wilkinson, in Mexico, and immediately presented them to the Horticultural Society, for culture and distribution. Besides the valuable articles for fields and gardens, there are parcels of the *Zapote*, the *Chirimalla* the *Mammea*, and other delicious fruits of the Tropics. The grains of the maize or Indian corn, are remarkable for their colours and figures; and there is an exceedingly curious ear, with purpleish, acuminate, and cinbricated grains, from the castle of the unfortunate Montezuma, about three miles from the city of Mexico.—*ibid.*

Prospects of the Farmer.—The open winter we have had, has been against the winter grain—the wheat and rye crops, we are informed, will be rather light, in this district of country, especially the latter. Generally, we believe, the prospect of corn is good, and that of grass quite promising. The wheat prospect in N. Carolina, has been injured by the caterpillar—in Canada, the wheat crop looks well, and the grass is quite full and forward.

Trenton, N. J. June 5.

On the Value of, and Different Modes of preparing, Burnt Earth for Manure.

[From Essays on Practical Husbandry, by Edwards Burroughs, Esq. Essay Second. On Manures and their application.]

[Concluded from page 347.]

It is evident that after the kindling is burned out, nothing remains but its effect, which is simply that of heating the sods immediately near it, and retaining a great body of heat in a confined space. By the heat being thus smothered, no reduction of the innate properties of the soil can take place, nor any of its gasses dissipate; neither is it much reduced in quantity; it is merely dried up, or torrefied, by the process, and made more capable of imbibing, when blended with the natural soil, those properties of the atmosphere conducive to vegetation.

Having stated the principle on which earth prepared in the foregoing manner, is converted into manure I shall make such general observations on the subject as may elucidate the matter more satisfactorily to the practical farmer, and to convince him that it is not formed on casual experiment originating in fancy, but founded on a system that has for many years existed, but which has only been lately brought to scientific perfection.

In the northern counties in Ireland, the burning of earth was very general; this practice is supposed to have originated from a want of manure, flax being a great exhaustor of the soil, and not producing any vegetable substance which would ultimately benefit after yielding that crop—I understand, from several intelligent persons who have seen this manure applied on different farms that it made the most inferior soils produce good crops of potatoes, corn and flax: but as I have not been an eye witness of their mode of preparing it, I must be satisfied to state the result of the experience which I have had for some years, both as regards its preparation, and in applying it on different soils.

I have already observed, that no part of a farm is so well calculated for this practice as headlands:—1st, From the soil being deeper on them than on other parts of the field: and, 2dly, From the benefit which the land will receive by cutting away such rising headlands, and giving it a gradual slope to the dykes or water-cuts. If such headlands can be found convenient to follow the lands, there will, consequently be much expense saved in carting out the manure; and even the brows or backs of ditches could be converted to this purpose without injury to the fences, and in many instances, would effect a general benefit. But should any of those resources for supplying sods fail, or that no subsoil calculated for burning can be found on the land, the surface of grass lands, which have a good depth of strong soil, may be advantageously devoted to this purpose.

It may be said, in objection to this practice, that the injury a piece of grass land so stripped would suffer, would be much more than any benefit that the manure produced from it could possibly be, for that the land so stripped could never be beneficial afterwards in any way whatever. I shall, therefore, state some experiments which I made on this point, and leave the reader to judge of the ultimate results.

First—I stripped about twenty perches of grass land; the upper soil a loamy sand, the

subsoil a poor yellow clay, very weak and friable. The upper soil was about twelve inches deep, and near ten inches of this was cut away in sods for kilns and burning: so that not more than two inches of the surface soil was left after the manure produced was carted away. The twenty perches were then ploughed, and manured with a well prepared compost heap, and a light dressing of the burned earth which it had produced, ploughed once, and then planted with potatoes: the crop proved of good quality and productive.—The second year it was planted with potatoes in like manner, and produced as well as the adjoining part of the field off which the sward had not been carried.

Second—I practised this the following year on a similar piece of land; and the result was equally encouraging, indeed more so for the potatoes were better where the sward was taken in the adjacent part of the field which was ploughed out of the ley, and manured in the same manner.

I do not, however, mean to assert, that there are not lands which, by such practices, are not in some degree deteriorated; but certainly the deterioration they suffer is not so serious as is generally supposed; and I have no doubt, was the land so treated to be well cultivated and manured for three years successively, that it would be effectually restored to its primitive state. Now, when we recollect the quantity of valuable manure which is obtained from so small a surface, surely it cannot be considered as bad management to create a temporary injury if such it should be, to obtain a permanent and extensive benefit.

Of the twenty perches as already stated, I had as much manure as dressed two acres abundantly for potatoes, and which the following year produced better wheat than was obtained off similar soil by the farm-yard dung. I also tried it for turnips the same year, and never had a more even or a better crop. Suppose then the staple of the twenty perches to have been reduced; query, can it not be brought to a sufficient depth by a few deep ploughings and judicious manuring, the expense of which would be but trifling on so small a surface?

It is well ascertained, that soil of any description can be made fertile by exposure to the atmosphere; and the appearance of soil brought up by deep ploughings, should never deter the cultivator from trying his skill in this way. Every day's experience shows us, that land which has been dug two spits deep becomes more fertile afterwards, although the good soil, as it is termed is turned down, and the subsoil brought up: this must evidently convince us, that much is yet to be learned in the science of promoting vegetation.

I shall now make some observations on the value of this manure in general, and show its great advantage as a means of extending profitable cultivation, and of promoting the comforts of the small farmer and cottier.

The number of acres which are followed throughout Great Britain and Ireland in consequence of the want of manure, causes a serious reduction in land produce for the consumption of the population of those countries; and this evil must increase progressively as tillage is extended, unless a sufficient means of renovating those lands under cultivation increase in

the same proportion. The system so generally practiced in Ireland of stimulating the soil by an application of lime, and giving it rest by occasionally fallowing, has been at length found to be unprofitable, and a practice which ultimately, on light soils especially, reduces them to barrenness. When lands are reduced to this state, it is no easy matter to treat them judiciously; for although they may produce light crops of some artificial grasses suited to their condition, yet the returns from these must be very deficient, and must, consequently be drawback from the general profit of a farm.—The discovery, therefore, of a cheap, valuable manure, must be considered as a matter essential to the interest of agriculture; and that which is the most easily obtained and the most efficacious must be considered as the most beneficial.

The expense of burning clay in the kiln here described, is from threepence to fourpence an Irish load, or about forty or fifty shillings an Irish acre. It is, however, necessary to state that when the sods of light soils are burned, the manure produced is not calculated to apply on similar soils, but should be put on tenacious clays, moors, and other soils dissimilar to that prepared for this purpose. But strong clay put through this process becomes excellent manure for soils of the same sort, its property is totally altered by torrefaction. Thus it will be more advantageous to obtain the strong soil, if possible for preparing this kind of manure.

I have found crops to be much benefitted by mixing peat mould with burned earth produced from light soil, in the proportion of one third of the former, and two thirds of the latter substance, especially should it be necessary to apply it afterwards on sandy soils. I tried an experiment on two acres of land last year to ascertain this fully:—one acre was planted with potatoes with the burned earth unmixed with any other substance—the other had the peat and the earth; and the result proved the superiority of the two substances blended. The peat mould was dug through the earth as soon as the kilns were fit to break down, and left in this state for two months; the heap was then turned, at which time the peat was highly fermented from the heat of the ashes and burned earth. I conceived that the vegetable matter contained in the peat, and its tendency to retain moisture, acted as an alternative on the soil to which it was applied, and which being a barren sand, was deficient of vegetable matter, and incapable of retaining moisture.

Burned earth may be depended on as a manure fit to produce abundant turnip crops of every description, on a variety of soils; even the Swedes, so difficult to grow on light soils, will prove a more luxuriant crop with this manure, than with farm yard dung, and are less liable to be cut off by the fly. For those crops, however, it should be well prepared by breaking down the kilns, as soon as they are sufficiently burned, and by pulverizing the sods, and mixing the ashes through them: and this should be repeated a third or fourth time if necessary.

It may be supposed by some, that any crop sown on this manure would be precarious in a dry season, not containing, as they may conceive, any enriching quality or properties to preserve moisture. But this is by no means the case; for it will be found, that an application of

torrefied earth will make the land on which it is applied more capable of absorbing moisture from the atmosphere, and by minutely dividing the soil, the roots of plants can search more freely for nourishment. I have often observed, that farm yard dung, unless very well prepared, does not, in excessive hot seasons, supply sufficient moisture to the roots of plants; and that during such seasons, crops sown on ashes, or burned earth, have uniformly thriven, while those in dunged land have gradually declined. I state this to shew more clearly the wonderful property of all burned and torrefied substances in absorbing the food of plants from the atmosphere, and afterwards preserving these for the benefit of vegetation.

It is a common practice among farmers, both in England and Ireland, to dig headlands, old ditches and other waste places, and to collect them for manure, by adding some dung or lime to them. This is attended with heavy expense. 1st. From the quantity of dung or lime necessary to make the heap profitable;—2nd, 3dly, From the double carting which takes place on which it is to be applied. Now, after all this expense, the manure obtained is of a very inferior quality to what could be obtained by putting the earth through the simple process which I have already described; and one load of it would be more valuable than double the quantity would be in its raw state. Thus a saving of one half the cost in carting alone, could be effected, one load of burned clay being equal to two loads of compost, besides having the dung or lime to appropriate to other purposes.

It may sometimes happen, that the place of which sods can be obtained is so much detached, that it would be attended with too much expense, and perhaps, great inconvenience, collecting them for a large kiln; in this case, heaps of the sods may be made and torrefied in the manner following, viz.

Let your flues be cut on the surface of the land, convenient to where the greater part of the soils can be collected, about eight inches deep, and six wide, and covered, as before directed, with strong sods. The firing is then to be placed in the centre, where the four sides meet, which must be stronger in proportion than what would be necessary for a close kiln, as the burning of the sods in this manner will entirely depend on the strength of the fire, and the judicious manner in which the sods are placed on the heaps. The kindling should be perfectly covered with the sods before it is lighted, and then piled heavily, as soon as it is well kindled, but observing to cover those places first from which the smoke issues is strongest. Two of the flues should be stopped as before directed;—and when the heap ceases burning which is generally the case in four or five days, it should be covered well with the surrounding soil, and so for some weeks before it is broken down or turned.

Sods burned in this manner do not produce such good manure as in a regular kiln; neither does a certain quantity of firing prove so productive in those round heaps, as it does in kilns; it is, therefore only necessity that should cause its mode instead of the regular kiln. By this it will appear, that by the erection of the walls, the heat is retained effectually, and will often continue for six or eight weeks after they have

done burning; whereas in round heaps the air having the full power on the surface, the internal heat is soon checked; besides, the walls ultimately become manure, and the expense of erecting them is but trifling.

Burned earth is an excellent manure for garden seeds, especially when applied on rich soils which have been often dunged, or inclined to weeds; it does not engender slugs or worms, and therefore, well calculated for such as are liable to be cut off by those insects.

On the whole, it must be considered as a most valuable addition to the farmer's means of cultivation and improvement; and I am satisfied that it only requires to be known in this character.

Norwich, Con. May 26.

Curious Fact.—A Mr. David Evans, of Plymouth, about eight miles from this village, some time last week, whilst chopping in the woods, felled a hollow tree which contained from four to eight thousand *Swallows*! They were of the kind generally denominated the Wood Swallow. The breast is white—tail forked, and tail feathers sharp pointed. When discovered they were principally in a torpid state.

Assistance to persons in danger of drowning.—This desirable object may be attained by the following very simple means! a man's hat and pocket handkerchief being all the apparatus necessary. Spread the handkerchief on the ground and place a hat with the brim upwards in the middle of the handkerchief—then tie the handkerchief over the hat as you would do a bundle, keeping the knots as nearly as possible in the centre of the opening. Now, seizing the knots with one hand, and keeping the crown of the hat upwards, any person, though unable to swim, may fearlessly plunge into the water with a rope, or any other thing that may be necessary to save the life of a fellow creature.

Important to Nurses.—It should be generally known that Laudanum, by long standing deposits a sediment which renders it dangerous.—Many valuable lives have been lost from ignorance of this fact. On the 12th inst. Dr. Cox, of Black Horse, was called to an infant 4 months old, to whom four drops of Laudanum had been given, three or four hours before. On examination, the phial was found to contain a torpid fluid, no doubt many times stronger than clear Laudanum. The child was in the agonies of death—oppressed with irresistible sleep—emetics would not operate; but by the prompt introduction of an elastic tube into the stomach, and the use of a syringe and warm water, its contents were completely washed out. In a short time the child was much relieved; and in the course of a few hours quite restored.

Interesting Information.—With much pleasure we have been informed that the Trustees of the Humane Society of Massachusetts, have awarded ten dollars to Mr. ROBERT PORTER, of Pittston, for saving the life of Miss RYLAND, Thursday, June 13, 1822.

This young lady, who is nearly related to Dr. Holland, of Augusta, was accidentally knocked overboard by the boom, in Kennebec river, a few miles below Gardiner, when on board of the sloop Messenger, Capt. Colburn, sailing with

a fair wind about four miles an hour. Mr. Porter jumped from the stern of the vessel, which was about fifteen feet above the water, into the boat, perhaps twelve feet distant, at the imminent risk of his own life; and after the young lady had sunk, and entirely disappeared, succeeded in raising her, and bringing her in safety on board, to the great surprise and joy of many spectators, who had beheld, with the deepest concern, and breathless anxiety, her extreme danger, without being able to afford any relief. *Halifax Advocate.*

NEW ENGLAND FARMER.

SATURDAY, JUNE 19, 1824.

FARMER'S CALENDAR.

SUMMER MANURE. The main spring of agriculture is manure; and by due attention with a little labor a great deal may be obtained in the course of the summer. You should mix your summer made dung, as far as practicable without devoting too much time to this object, with at least an equal quantity of earth. In this way the gasses or volatile parts of the manure will be absorbed, and the whole will be less liable to be washed away by rain, or dried up by the sun. The recrement of vegetables, the dropping of animals—every thing capable of undergoing the putrefactive process should be covered with earth, and if there is a roof over it into the bargain so much the better. Do not permit, if you can conveniently avoid it, a cat, a rat or so much as a mouse to rot on your premises without covering the carcase with a shovel full or two of mould, or earth of some sort. Plough up your head lands, and cart the earth to the yard in which you keep your cows or other cattle, and every morning before breakfast, and (when you do not happen to be very sleepy) before sun rise, cover whatsoever offendeth the olfactory nerves, or in other words does not smell quite so sweet as a rose, with a proper coating of the earth aforesaid.—You may increase this aggregate with the cleanings, sweepings, &c. of your cellars, old brine in which meat has been preserved, decayed and decaying vegetables, &c. &c. If you suffer any thing to remain in your cellar or any other part of your tenement, which emits a bad smell, you may calculate on fever in the fall; and if you are gifted with any thing like *second sight*, as they call it in Scotland, or have a presentiment of what you are coming to, you will dream of funerals in the family, and doctor's bills almost as long as bills in chancery.

Don't let your daughters nor your female help throw any of their slops, including dish-washings, &c. either into the front yard or back yard, to manufacture gnats, mosquitoes, and typhus fever, but see that all such matters are put into a sink, and that the sink has a proper spout and trough to conduct that sort of liquid manure to a proper receptacle, where it can be mixed with earth, and form a rich compost. Every day or two (or better every day) you will mix the manure of your back house with good loam, and we will, therefore, and thereupon, set you down for a neat cultivator, and prophesy that you will one day be rich—unless your wife and daughters are very extravagant, spin street yarn, see too much company, and wear their go-to-meeting clothes every day.

If you live in the vicinity of a wood-lot you

may employ your spare team, and leisure hours in gathering the rotted and half rotted leaves of hard wood for manure, including the mould by the decomposition of the leaves.—These substances, we are told, and do not doubt it, will make good manure for potatoes, and if you have not finished planting them it may be well to put some in your hills. But it would probably be quite as well to mix them with other ingredients in a compost heap, or place them in a proper situation to receive and imbibe the stale of a stable, form a bed for your cattle to sleep on, or let your hogs take them into their custody.

Lime will be found an useful ingredient in your composts, and perhaps there is, in common cases no better way of applying it to land than by previously mixing it with manure.—Judge Peters, of Pennsylvania, however, says, "Mix no hot lime with your muck, dung, or compost heap, before fermentation has ceased, or sufficiently advanced; as it injures moderate fermentation, and often consumes the muck. Instances of even conflagration of strawy muck by hot lime to a great extent can be given.*" You should not mix hot lime alone with any substance intended for manure, which fire can injure or consume.

Sir John Sinclair says, "it has been found that an excellent compost can be prepared, by collecting all sorts of weeds, as thistles, docks, nettles, fern, &c. before they have formed seed, and laying them up with alternate layers of rich earth. A great heat is soon raised, and by turning the heap over, the next spring the whole will be resolved into a soft pulpy mass, the effects of which on the soil are in no degree inferior to dung. Thus a great nuisance may be converted into a valuable manure."

We have, heretofore, published directions and recommendations relative to employing hogs in making composts, &c.† We will, however, copy the following from the "Farmer's Manual," by Mr. Butler, which contains directions, concise, plain, and particular enough for practical purposes.

"Let your hogs be enclosed in an open pen, near to, or in one part of your barn yard;—throw into this the scrapings of your barns, together with every vegetable substance that will putrefy and rot through the summer;—plough up and cart occasionally, such earth as can be collected from your ditches, or old sward balk; your hogs will root and mix them together, and thus with a little attention, you may obtain 20 or 30 loads of the best manure, or much more if your hogs are numerous." If you employ hogs in this way you may, perhaps, save yourself the trouble of making compost beds, besides enjoying the satisfaction of making those lazy animals work for a livelihood. You will be careful, however, to supply them with a comfortable apartment, well furnished with straw to lodge in. This straw you will clear out frequently to be mixed with other matters in the manure yard, and a fresh supply should be granted. You will also please to recollect what was stated by "A Farmer" in

our first volume, page 373, relative to feeding hogs which are put upon the limits, but allowed the liberty of the yard, with green food;—and you will not forget that *scamp-brakes* are recommended as a useful article of diet for swine thus situated.

SAXONY SHEEP. The attention of our readers is requested to the notice of the sale of Saxony sheep, which we have published in the advertising part of this day's paper. This kind of sheep has long been famous in Europe, and its value we are happy to perceive, is beginning to be properly appreciated in the United States. We do not know any method by which the importers could have conferred a greater benefit on the farmer, the manufacturer, and the community in general than by the introduction of this race of animals, which, are considered, by the best qualified judges, as standing at the head of their species.

Mr. John Lawrence, an English writer whose acknowledged reputation as a practical, as well as scientific farmer, has placed him in the first rank of British agriculturists, gives the following observations on this breed of sheep.

"The government of Saxony received from Spain, in 1765, one hundred rams, and two hundred ewes, of the best blood. During a few years, the improvement of the Spanish cross was opposed by the common prejudices of the farmers, but they afterwards became so convinced of its utility and importance, and were so desirous of becoming purchasers that the electoral flocks were insufficient to supply the demand, on which account, another importation of the same number with the first, was made from Spain, in 1770, and part of the flock distributed at prime cost. It was found by comparison that the wool of the first importation had, in no respect degenerated. But Lord Somerville has produced the best proof of the undeniable excellence of the Saxo-Spanish wool, by stating that 200 bags of it were imported into this country in 1802, and sold at the prime price of native Spanish wool, the cloth it produced bearing an equal character. The manufacturers of fine cloth in Saxony, finding in their own country, both quantity and quality of wool equal to their demand, have long since ceased to import from Spain, and have nothing farther to dread on the score of disappointment in their commerce. Farther the Saxons even grow a surplus of fine wool for exportation, equal in quantity to their home consumption. Saxony maintains 1,600,000 sheep, of which 90,000 are fine-wooled, including thorough bred and crossed."

Rees' Encyclopedia observes that "Saxony is the only country which has yet cultivated the Merinos so extensively, as to come in competition with Spain in the exportation of fine wool. During the last fifteen years a very considerable quantity of fine wool has been imported from Saxony into England, and the price of the best sort is greater than that of the finest Spanish wool, a sufficient proof of the estimation in which it is held by the manufacturers. It is better suited for the finest supermeres, and the more delicate articles of the woollen trade, as it can be spun to a greater length than any other kind of carded wool grown in Europe."

We can perceive no impediment, moral or physical, to raising as fine sheep, and as many in proportion to the population in our Northern and Middle States as are or can be raised in Saxony. Our soil and climate is, probably, as favorable to their growth and increase as that of Saxony, or any other part of the habitable globe. Dresden the capital of Saxony is situated nearly 500 miles farther north than Boston, the metropolis of New England. The mean temperature, however, of the climates of the two countries (owing to causes, which we have not at present leisure or room to explain) is probably about the same. Wool of an excellent quality ought to be, and we have no doubt, at no very distant date will be the great staple commodity of New England. Farmers, more especially, who live at a con-

siderable distance from our sea ports will find their account in sending wool to market instead of articles of less value in proportion to the expense of transport.

A very important principle is established, or at least rendered very probable by the facts mentioned above, viz. *The Merino breed of sheep does not degenerate, if properly managed, in consequence of being transferred from Spain to other countries.* On the contrary we have adduced facts which corroborate the opinions of Robert R. Livingston, L. L. D. &c. &c. who in his excellent "Essay on Sheep," says,

"For my own part, I believe that the change in the Merino sheep brought into any northern country, provided they are plentifully fed, will be for the better, and particularly into this state, [New-York] where the pastures are good, the air and waters pure, the winters cold, and the summer range furnished with shade. I should have presumed this in reasoning *a priori*, and I have found my theory confirmed by actual experiment."

We cannot prevail upon ourselves to relinquish this subject without giving another quotation from the Treatise of Mr. Lawrence above mentioned.

"Spanish sheep have succeeded and improved in carcass, the wool retaining its genuine fine quality and full quantity, without the smallest symptom of deterioration, in almost every country upon the continent of Europe, even those of the most unfavorable soil and climate, at the Cape of Good Hope and Botany Bay, through a long course of years; in Saxony upwards of fifty, in Sweden more than fourscore. The fine cloths made from such naturalized wool have given general satisfaction, with the exception of those who appeared to have an interest in being dissatisfied. Patterns of superfine cloth made from his Majesty's and Lord Somerville's home-grown Spanish wools are now before me which I am assured by individuals of the trade, who work up the cloth, are fair merchantable samples, no wise defective in regard to the wool, but if at all, in the manufacture only. That cloth of such home-grown Spanish wool, when fairly manufactured, has ever been rated equal in quality with the general run of superfine cloths. That the assertion must be groundless, of superfine cloths and kerseymeres being manufactured of Spanish wool only, since it is well known, that the quantities annually imported have been totally inadequate to such purpose. That, as English wools, in their unimproved state, necessarily go into the composition of fine cloths, and as in strong probability, much superfine cloths have been constantly on sale, which never contained any Spanish wool at all; there is the stronger plea and encouragement for the improvement of the said English wools. That the samples of home-grown Spanish wools, whatever may be their intrinsic merit, have at least so much deception, that the dealers are frequently at a loss to distinguish them from the imported Spanish, and have sometimes been known to prefer the former. That the wool-buyers acknowledge this equality by the nearly equal prices they now give, and also the reality of the improvement from the Spanish cross, by the great advance of price they have allowed on improved native wools. These wools also are nearly or altogether doubled in quantity, by virtue of that cross. That no loss in carcass, or mutton per acre, is a consequence of the Spanish cross, because of the superior number of a smaller breed, which the same acre will feed. That the Spanish mutton is equal to any in the world, and the species small boned, and very apt to take on fat.—That neither better care nor better keep is required by the Spanish sheep, than the English, but that one as well as the other requires more of both than they generally have. That the improved species is, in all respects equally well calculated for the use and profit of the tenant, as of the landlord."

TO CORRESPONDENTS. The communication from the Hon. Mr. Fiske, (the first article in this day's paper) is very acceptable to us, and must prove very valuable to the public. We think that gentleman has established the reputation of the breed of swine, which he has made such patriotic and successful efforts to introduce, on a basis of facts which cannot easily be shaken.

* Notices to a Young Farmer," published in "Memoirs of the Philadelphia Society for promoting Agriculture," vol. iv. page 25.

† See New England Farmer, vol. i. page 292. Vol. ii. page 178.

We hope Mr. Preston's advice and example in giving us a report of the season, and its effects on the vegetation in its vicinity will be followed by gentlemen in other sections of the country. Individual agriculturists, as well as the public at large might derive profit from intelligence of this kind. It would afford useful facts as respects the diversities of climate, &c. in the United States, and enable farmers to send their surplus productions to those parts of the country in which they might be most wanted.

The communication of Mr. Stevens relates to a subject of great importance, and states facts which if generally known, would prove of much general utility.

The queries of "Agricola" relative to that pest of fruit trees called the "Borer," merit patient, attentive and thorough investigation. Some of our friends have already volunteered their services to endeavor to ascertain facts relating to the natural history of this depredator. We hope the result will enable the orchardist to assail him with such success that his utter extermination will be the consequence.

The gentleman who was so good as to direct our inquiries to a certain paper of the Mass. Ag. Repository, rich gives information relative to "*Lice on Apple trees*," will perceive that we had anticipated his intimation, in No. 45, page 353 of the present volume of our paper.

FOREIGN.

A Kingston, Jamaica, paper states that the Spanish squadron, which lately sailed from Havana in pursuit of the Colombian vessels, which captured the Ceres, is preparing to blockade Puerto Cabello.—It is also stated, that the small-pox had been introduced into the land by a vessel from New York.

Peru.—Accounts have been received at Baltimore on the 10th of June by a vessel eleven days from Jamaica, stating that at the last mentioned place intelligence had arrived that Lima and Callao had both fallen to the hands of the Royalists. Troops were collected along the coast at Carthagena, &c. to send by the way of Panama to the South as fast as possible. Theoyalist force was computed at about 9000 men, being 300 more than the force of the Patriots. Another engagement was expected shortly to take place, and fears are entertained of the defeat of the Patriots.

Santa Martha, May 22.—Callao has again fallen into the hands of the Spaniards through treachery.—Troops are sending off from all parts of Peru, and in the affairs of the Patriots do not appear to prosper.

DOMESTIC.

Fatal Accident.—On the 14th inst. the sloop Vont, Capt. Burrill, was upset in Boston Harbor by a sudden squall; and notwithstanding prompt assistance as rendered by a sail boat, and the crew of the Rapid, vessel sailing at a short distance, Mrs. Cushing, of Plymouth, a child of Mr. Sampson, of do. and a daughter of Mr. T. Allen, of this city, were drowned. Several other persons were rescued from the wreck, and a Mrs. Bates and child were saved from the ship by cutting a hole in the quarter.

Florida Claims.—The amount of claims allowed as due under the Florida treaty, is \$5,454,545. As five millions only were stipulated by the treaty, and appropriated by Congress for the payment of said claims, they will be subject to an abatement of 8 1-3 per cent, unless further provision be made, which we presume there will not. So that \$100 of the allowed claims is worth \$91.66.—*Ecc. Telegraph.*

New Hampshire State Prison.—The income of the new-Hampshire State Prison during the year ending May 31 was \$2,799 61 more than the expenditures. A part of the appropriation of last year has been unexpended, and no appropriation is required for the year ensuing.—*ibid.*

MASSACHUSETTS LEGISLATURE.

IN SENATE.—Thursday, June 10. A Report of a Committee that it is inexpedient at this time to make any alteration in the Districts of this Commonwealth for the choice of Representatives to Congress, was accepted.

The Secretary of State delivered a Message from the Governor, together with certain documents relating to the claim of this State upon the General Government. This gives a concise view of the history and situation of the claim, and states that "the National Government have manifested the most friendly disposition to accelerate its adjustment, at the approaching Session of Congress.

Friday, June 11. Resolves passed on the subject of the boundary line between this State and Connecticut: Relating to pay of Deaf and Dumb persons: Regulating the form of returning votes for Electors of President and Vice President, &c. A number of other bills were finished, but as they were of a private or local nature, their titles are omitted.

Saturday, June 12. The Committee on the subject of the Hon. James Lloyd's letter, relating to a Canal from Buzzard's Bay to Barnstable Bay reported that the same be referred to the next session.

Sundry Resolves, relating to the Massachusetts' Claim upon the General Government were reported and passed in concurrence.

The pay roll of the Senate, amounting to one thousand seven hundred and forty-two dollars, was read and accepted.

HOUSE.—Thursday, June 10. A Committee was appointed to consider the expediency of authorizing the Treasurer to borrow of any of the Banks such sum of money as may be necessary to meet the ordinary demands of the Treasury during the present year.

A form of return of votes for Electors of President and Vice President was reported, accepted, and the Secretary directed to furnish each town in the Commonwealth with two copies.

It was ordered that the Report of the Committee on the petition of the Trustees of the Amherst Institution, and all the papers, relating to the subject be referred to a Committee of five members of the House, having power to send for persons and papers, &c. This Committee was directed to inquire what amount of the nominal funds can be collected; what means have been resorted to by the petitioners, &c. to procure subscriptions, &c.; what methods have been adopted to procure students, and to obtain such other information as may be useful in deciding whether the public good requires a new College at Amherst, and to report to the General Board on the first Monday of their next session. The question of the commitment was carried. For the commitment 101. Against it 89. The Speaker then nominated Messrs. Phelps of Hadley, Sprague of Salem, Lincoln of Worcester, Webster of Boston, and Smith of Milton, to compose the Committee.

Friday, June 11. On motion of Mr. Philips, of Salem, a resolve requesting the Governor and Council to make such arrangements as might secure to the Marquis De La Fayette, on the event of his visiting this country, an honorable reception on the part of the State, and to draw his warrant on the Treasury was unanimously adopted in both branches.

A Resolve passed, requesting the Governor and Council to write to the Governor of Connecticut on the subject of an amicable adjustment of the boundary line between the two States.

A Resolve passed for granting \$600 for the support of certain Deaf and Dumb children at Hartford.

Saturday, June 12. A number of private bills passed to be enacted. The Committee on the subject of Congressional Districts made a report that it was inexpedient to make any alteration, which report was accepted.

The Committee appointed for the purpose, reported the Pay Roll, amounting to \$10,194, and the Governor was requested to draw his warrant on the Treasury for the same.

The Secretary came in with a Message from the Governor, informing the House that he had approved of forty Acts, passed at the present session, and that the Legislature was prorogued to the 1st Wednesday of January next.

SAXONY SHEEP.

On THURSDAY, 15th of July next, at 3 o'clock, P. M. at the Punch Bowl Tavern, near Boston,

Will be sold at Auction, an entire flock of SAXONY SHEEP, consisting of 46 Rams, 25 Ewes, and 4 Lambs, just arrived per Varsity from Bremen.

These sheep were selected with great care, by a person fully qualified for the purpose, from among eight or ten thousand of the finest sheep in Saxony, and are presumed to be decidedly superior to any sheep which have heretofore been imported. The comparative value of Saxony Wool above the Spanish is well known; the small quantities which have reached this country, have been eagerly bought up by the manufacturers of fine cloths, but the duty imposed by the new tariff, will soon prevent further importations.

Purchasers are assured that none of the sheep will be disposed of on any terms, before the above date; they may be examined any time previous to the day of sale at Mr. Perry's, about a quarter of a mile from the Punch Bowl Tavern in Brookline, on the road leading to Cambridge.

Catalogues will be immediately prepared and ready for delivery. Conditions liberal and made known at the sale.

COOLIDGE, POOR & HEAD, Auctioneers.

From the National Gazette.

On the loss of the Steam Boat *Atna*, within sight of
New-York,
Saturday afternoon, May 15, 1824.

Her path was on the briny deep :
Yet no white sail propell'd her course,
Nor measur'd her with graceful sweeps,
Urg'd her to stem the billow's force :
Self-mov'd, with fleecy track she past,
Disdaining in her pride
To woo the breeze, or shun the blast,
Or wait the rolling tide,
While boldly to the sky
Her ensign wreathing high, [she cast
Inwrought with volum'd smoke, and sparkling flame
Lightly o'er her bosom ro'd,
Where rainbow mirth was shining,
Forms rever'd, and hearts below'd,
In changeful groups combining :
Childhood's smile,
And Beauty's wile,
Manhood with his brow of care,
And matron tenderness was there :
Above the azure sky was glowing,
Beneath, the flood, like silver flowing,
Around, in chequering light and shade,
Her hues delighted Spring display'd ;
Velvet verdure deck'd the vales,
Winding rivers, white with sails,
Through their tufted margins stray'd :
Each dazzling scene, like moving picture, threw
Its coloring on the eye, and rapidly withdrew.
And now the setting sun, in liquid richness, pours
A flood of glory o'er the approaching shores
Of that proud mart, which like a queen
Upon her island shone, is seen,
With thronging masts and spires, in long array ;
Then sparkling eyes were bent,
And ardent glances sent,
Tho' the soft misty curtains of declining day,
To gain some vestige of their home ;
Gay fancy decks the dome
With flowers of joy ;
A richer blush steals o'er the virgin coy ;
And, lost in speeches of love, the mother clasps her boy,
Hark !—'tis the crash of thunder !—But no cloud
Mantles the untroubled sky,
Again !—it blends with cries of anguish loud,—
In air disrupted members fly,
In flood streams, and beneath the waters roar
Th'unge deck'd who rise no more.
And ah ! outstretch'd I see,
In nameless agony,
Woman's imploring hand,—the piercing cry
Of suffering innocence invades the sky,
Haste—snatch them from the wreck ! O God ! they
Grieve—they die !
'Tis silent on the wave. The thunders sleep ;
But many a stricken soul shall mourn the ire ;
Still suile's the sun ; but many an eye shall weep
Ere to his sea-girt chamber he retire :
The unexpected guest—the sister fair,—
The child, with fond, confiding air,—
The friend, who with an angel's mien
Himn'd the dear, domestic scene—
Ah ! ask not—ask not, where they are,
Or why they come not !—See despair
Read from the mourning sea
The few thin remnants of that silver hair,
Which, frosted o'er with age, e'en ruthless time
Could spare.
Who to the orphan's arms its treasure shall restore ?
Who, bind the widow'd heart, which breaking, heals
No more ?
Frail as a flower, beneath the blast of pain,
How impotent and vain
Is man, to boast him of his zephyr's breath,
Man, whose whole race of life is on the verge of
death !
He,—he alone who trod
The waters at his God,
And from their dark embrace rescu'd the sinking form,
Can, when the whelming surges roll,
Draw, with pierc'd hand, the unbodied soul
To that Eternal Ark, serene above the storm.

Miscellany.

Etiquette.—It is almost painful to give one's attention to these *stiff* affairs, which go so very nearly to extinguish the socialities of life, for the mind is fettered and bound up, as it were in *stays*, manufactured by the ceremonial masters of mankind,

"Who're gravely dull, insipidly serene,
And carry all their wisdom in their mien."

This gravity has been defined by a French wit, as a mysterious carriage of the body to cover the defects of the mind. Locke, according to his biographer, always praised Rochefoucault's maxim, "that gravity was but the mask which stupidity wore to cover its defects." Dr. Young says,

"And be this truth eternal ne'er forgot,
Solemnity's a cover for a set."

Some people make a mystery of every thing, (they must bid you good day in a *whisper*), looking exceedingly wise, even about trifles.—Statesmen, a race of beings who occasionally commit the most remarkable blunders, but still retaining the name of statesmen, have a great predilection for this mystery. So affected was the Count de Viry, in this way, that, when he died, some person inquiring after him, his secretary said, "He is dead, but does not wish it to be known;" and the king of Sardinia, (his master), said, when he heard of his death, "that he would make a mystery of it if he could."—We have seen, where cunning supplies the place of intellect, and a handicraft mechanism the substitute for the mind, where, in Corrau's peculiar phrase, "men begin to measure their depths by their darkness, and to fancy themselves profound, because they feel they are perplexed."

Dr. Moore (author of *Zeluco*) used to say that, "At least two-thirds of a physician's fees were for imaginary complaints." Among several instances of this nature, he mentions one of a clothier, who, after long drinking the Bath waters, took it into his head to try the Bristol hot wells. Previous, however, to his setting off, he requested the favour of him of a letter, stating his case to any brother Galen. This done, the patient got into a chaise and started. After proceeding about half way, he felt an itch to pry into the contents of the letter, when the following words presented themselves:—"Dear sir, the bearer is a fat Wiltshire clothier; make the most of him." It is unnecessary to add, that his cure was at that moment effected, as he ordered the chaise to return, and immediately proceeded home.

Dr. Mundy, of Canterbury, Dr. Radcliffe, and Dr. Case, spending an evening together, were very jovial. "Here, brother Case," says Dr. Radcliffe, "is a health to all the fools, your patients." "I thank you, good brother," replied Case, "let me have all the fools, and you are heartily welcome to the rest of the practice."

An eccentric old dame, who lately died at the west end of the town, and who had been receiving benefit from a charitable fund, left behind her the following strange assortment of articles:—490 work bags, full of ribands, &c. 150 pockets, 5000 thimbles, 100 snuff-boxes, a great

quantity of pins, 300 china and crystal articles, 1100 pincushions and needle-books, several pecks of buttons, 20 pair of silk stockings and gloves, 400 matches, 1000 pen-knives and scissors, 21 black silk bonnets, and a great number of gowns.—*Dundee Advertiser*.

A sweep passing yesterday through Broad-st. St. Giles, was annoyed by a coal-heaver's boy, and on being asked why he did not show fight? answered "Sweeps don't dirt their hands with coal porters."

A strange custom prevails every where in Chili, at balls, public as well as private. Ladies of all ranks who happen not to be invited, come in disguise and stand at the windows or in the passages, and often actually enter the ball room. They are called *Tapadas* from their faces being covered, and their object is to observe the proceeding of their unconscious friends, whom they torment with malicious speeches, whenever they are within hearing.

Anecdote of Howard.—The Governor of Upper Alsace, a vain man, and his Countess, still vainer, honored Howard with a visit. With a very haughty air, the governor asked the state of prisons in his government. "The worst in all Germany," said Howard, "particularly in the condition of the female prisoners; and I recommend to your countess to visit them personally, as the best means of rectifying abuses in their management." "I!" said she, "I go to the prisons!" and hurried away with her husband so rapidly, Howard said he was seriously afraid she would fall down stairs. He nevertheless called after her with a loud voice, "Madam, remember that you are a woman yourself, and must soon, like the most miserable female prisoner in a dungeon, inhabit but a small space of that earth from which you equally originated."

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for vending LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and comes at a less price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

March 27.

PATENT STEEL SPRING HAY FORKS.

JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Mower FORKS. Also, a few dozen very superior Bakers' Cans, cast steel Scythes, Dudley's warranted steel back do., Bishel's cast steel polished Shovel—together with a great variety of other agricultural implements. June 12.

WANTED No. 43, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper. June 12.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

LICE ON APPLE TREES.

To the Editor of the New England Farmer.

SIR,—In your paper, Vol. ii. No. 11, I saw some inquiries respecting Lice on Apple Trees. Upwards of thirty years ago, I sowed a nursery, and when nearly of size for setting out, they were attacked by those lice, the first I had ever seen. I was surprised to find they were a living insect, I scraped off abundance, but they increased for three years, and covered the limbs to the ends of the twigs that scraping or rubbing with corn cobs was no longer of service. I found no washes that would check their increase, and I tried them with fire and found the following mode effectual.—I dug up such as were of size to set out, made fires of straw litter or dry leaves and drew them quickly through the blaze; turning them round so as to scorch the lice, and not injure the bark. After setting them out they flourished very well, and no more lice appeared on them, and about the fourth season they all fell off by the course of nature, and I have not seen any since. They are periodical, and may perhaps like the locust appear again at some future day. They killed and injured abundance of trees; such as died appeared to be black and defective at the heart; such as survived grew over with moss, that I found necessary to scrape off.

Since which time I have been informed by a gentleman of observation that he readily cleared them all off his trees by cutting or peeling a small piece of bark and putting under it a small quantity of quicksilver or strong mercurial ointment. Since hearing of the above remedy here are no lice here to try the experiment.

At all events they are a very pernicious insect, not described by naturalists. They must come naturally out of the earth, for the ground of my nursery was new, never had apple trees on it before. Their continuance here was four seasons, and they all disappeared about twenty years ago. Such trees as I scorched in a blaze of fire flourish and do well. Such as survived without fire, are defective, slow of growth, and of worth cumbering the ground.

SAMUEL PRESTON.

Stockport, Pa. June 10, 1824.

BY THE EDITOR. It has been asserted that water, adding hot, applied to trees infested with lice, by a soap or swab will destroy these insects, provided this application is made at a proper season of the year. Mr. Erley says that the blisters or barnacles on the trees, which are called lice, but are in fact only the tenents, or habitations of the insects, "contain from ten to thirty nits or eggs each, which in a common season begin to hatch about the 25th of May, and finish about the 10th of June. These nits produce a white animal, resembling a louse, so small they are hardly perceptible to the naked eye; which, immediately after they are hatched, open the passage at the end of the stier, and crawl out on the bark of the tree," &c., appears further that all remedies are ineffectual unless applied between the time in which the animalcules are enclosed in the blisters or barnacles and the period

of their leaving the tree, which would seem to be from about the 25th of May to the 5th of July. Burning or scalding the habitations of the insects can be of no avail after they are deserted by their tenants. But we can perceive no reason why hot water may not prove as fatal to them as scorching them by fire, and the hot water may be applied without taking up the tree, and we should think with less risk of injuring it. But perhaps the persevering application of white wash composed of quick lime and water, may be as good a remedy as any discovered. See New England Farmer, vol. ii. page 336.

CATERPILLARS.

To the Editor of the New England Farmer.

SIR,—We farmers are indebted to you and your correspondents for much valuable information, from time to time; but occasionally we are sadly hoaxed by some schemers, who never held or drove a plough. This ought not to be, for the other day one of my neighbors refused to subscribe for your paper, because he had once read in print, that the best way to make a ditch on hilly land, was to begin at the top.

Last summer you published George Webster's communication to the Board of Agriculture of the State of New York, on destroying caterpillars with sulphur. George told his story so well, that I was half inclined to think it true; but fearing I might injure a tree by boring into it, I concluded to rest satisfied with Pickering's brush, which I had always found effectual, until I should hear more about the sulphur method. On reading your paper of the 5th June current, now, thinks I to myself, it must be true that sulphur will kill worms on trees, for a yankee farmer in Connecticut, says the "process has been found infallible." So I sent to neighbor B's and borrowed an inch auger. I selected one of my best cherry trees, at least thirty feet high, and ten inches through the trunk, three feet from the ground, (having three large flourishing nests on it, one above another) and bored a hole six inches into it.—This hole I filled with flour of sulphur, rammed it in well, and plugged up the hole tight. In all this I was "very particular," as the quack doctors say, (not Dr. Caustic) and expected soon to see caterpillars, canker worms, weevils, &c. &c. scampering for their lives. In twenty four hours after the deposit of sulphur, I visited the said tree, and sure enough, the reptiles were walking briskly up and down the trunk. Now, says I to the vermin, you are in trouble.

The next day, exactly forty-eight hours after I made the deposit, I repaired to the cherry tree, to witness the total discomfiture of my enemies. If you can, Sir, guess my surprise, on finding the caterpillars all snugly housed, (except a few sentinels left to keep guard) as if nothing had happened below. I thought I could see the said sentinels laughing at me for my pains. Four days after, I found that grass (sulphur) would not bring them down, and pelted them well with stones (the brush.) So much for their temerity, and my folly.

After all, Mr. Editor, suppose the sulphur had destroyed every caterpillar, great and

small, I could have annihilated them in one quarter of the time, with the brush invented by the venerable Pickering, to whom all farmers are much indebted.

A BROOKLINE FARMER

June 22, 1824.

BY THE EDITOR. One of the advantages, which it is hoped will accrue to the agricultural community by the publication and circulation of an agricultural newspaper consists in the facility, which it affords of contradicting and refuting erroneous opinions, which may have been generally or partially diffused, with regard to Agriculture and Rural Economy. We always entertained, and have several times expressed, doubts respecting the efficacy of sulphur, applied in the manner above adverted to, as a preservative against the caterpillar. But we wished the experiment might be made, so that we might oppose matter of fact to what appeared impossible in theory. It is oftentimes useful to lay before the public an account of experiments, which have not succeeded, as it prevents useless, but troublesome and expensive repetitions. We think that the well written article by Dr. Thacher, published in our last paper, page 370, together with the above pointed remarks of "A Brookline Farmer" will prevent farmers from placing any confidence in a remedy, which notwithstanding plausible statements and respectable authority, it now seems, will not endure the test of actual experiment.

From the Old Colony Memorial.

IMPORTANT DISCOVERY.

A new and expeditious method of milking cows.

I had the satisfaction of witnessing, in presence of a number of gentlemen, a cow evacuating the whole of her milk by the following simple contrivance. A rye straw was introduced into the orifice of each teat through which the milk flowed spontaneously in a full and uninterrupted stream, until the udder was completely emptied. In exactly five minutes, between 5 and 6 quarts were thus drawn off.—After the straws were withdrawn the udder was collapsed and empty, and not a spoonful of milk could be obtained by the efforts of the hand. It is well known to anatomists, that the numerous milk tubes or canals are so formed as to communicate with each other, and all terminate in the extremity of the teat, and the milk is retained by a power similar to the contraction of a sphincter muscle. The straw or any tube being introduced removes the contraction mechanically, and allows the milk to flow freely. The discovery of this novel process was reserved for a simple rustic boy in the town of Middleborough. His father, by the name of Bent, having a cow that did not yield her milk without great strength and effort, was induced to sell her to a neighbor, but she was for the same reason returned again to the original owner. The boy always dreaded the milking as a very laborious and fatiguing task, while his brother finished milking another cow in half the time. After some time, however, the boy, who had the most difficult task assigned him, brought in his milk before the other. Mr. Bent inquired

by what means he had finished milking sooner than usual. The boy was silent and the secret remained undiscovered for several days, when the father accompanied him to the barn and had his curiosity fully gratified. The boy opening a box which contained a number of rye straws, one of which being introduced into each teat, the cow was speedily milked without the smallest exertion. The straws are introduced about half an inch, which is done with great facility, the cow discovers not the least impatience, but in withdrawing the straw a little force is required. Small quills made entirely smooth at the end would be preferable; but milking tubes may be made of silver or tin, and it is not improbable that those articles will soon be numbered among our indispensable utensils. The size should be a little larger than a quill from the wing of a hen. Whether the habitual employment of the tube will tend to impair the retentive power of the teat or otherwise prove injurious must be determined by experience; but I am inclined to the opinion, that no injury will be produced as the substance of the teat is not very susceptible of irritation or of inflammation. We may now congratulate our milking men and milk maids on this very important acquisition from which may be anticipated the following advantages.

1st. A dairy of 50 or more cows employs twice in a day 6 or 8 persons in milking—by this new method, if the tube is made of the full size of the orifice to receive it, the whole business may be performed in one third of the time, and with greater ease to the milker and the animal.

2d. We may be relieved from the unpleasant apprehension of dirty hands employed in milking.

3d. When the udder is in an indurated or diseased state, or the teats tender and excoriated, the animal may be milked without pain.

4th. Fractious kicking cows may in this way be milked without trouble and danger.

Had this curious discovery been made by philosophers and physiologists in past ages, they might have claimed a rank with Franklin and Jenner, but the Middleborough boy is surely entitled to public consideration for his ingenuity.

I cannot resist the desire (if the association may be permitted) on this occasion, to suggest another happy consequence that may result from this discovery, one in which our personal feelings are more particularly interested.

JAMES THACHER.

Plymouth, June, 1824.

[Since the above was in type, and part of it struck off, the Editor has been favored with a letter from Dr. Thacher, from which we give the following extract to admonish against entrusting unskilful or careless people to perform an operation which may be attended with serious injury.]

"The cow on which I witnessed the experiment, is still milked with straws, with perfect facility and unattended by the least unfavorable effects, but in other instances, under the management of boys, I understand that serious difficulties have ensued; such as obstructions in the teat, and diminished quantity of milk, &c. Instead therefore of copying my communication into the New England Farmer, I will thank you only to refer to it and state the information which I now communicate. But if you should

prefer to insert the whole article or an extract from it, please to observe that cows have received injury by the unskilfulness of boys introducing rough quills and straws, and that further experience by the careful use of smooth tubes, must decide as to the utility of the method."

From the American Farmer.

BEST FOOD FOR YOUNG TURKIES

MR. SKINNER.—Permit me through the medium of the "Farmer," to present my grateful acknowledgments to my Cousin Tabitha, for her instructions on the subject of preventing the gapes in young turkeys and chickens. No disease perhaps, is more destructive to those species of poultry. My Cousin's philosophy, doubtless, is sound, as to the nature of the disease; for not being a professional anatomist, I am not disposed to controvert the opinions of those more scientific than myself. I am no theorist but for my practical knowledge in matters of domestic concern, am indebted to personal observation and the experience of others. As our progress towards perfection in the improvement of domestic comforts and conveniences is greatly accelerated by taking advantage of the discoveries of those who are well versed in such matters, perhaps it may not appear presumptive in me to suggest to our cousin, and your other readers, a mode of preparing food for young turkeys, which, for a long time I have successfully adopted, and which recommends itself by its simplicity. Two eggs boiled to hardness, cut fine; a handful of young mustard, also cut fine; Indian meal scalded in boiling water, all mixed together with a small quantity of ground pepper, are sufficient to feed at one time one hundred young turkeys, to be increased in quantity as they increase in size, until five or six weeks old. They are very fond of this mixture. Eggs that remain after the setting hens are supplied, though unfit for other purpose, answer this end. Feeding my young turkeys on food prepared as above described, I have never known an instance of one dying with the gapes, though until I adopted this preparation I found it extremely difficult to raise any considerable number of them.

I have usually sown mustard seed at such time as to have it young and tender about the seasons in which turkeys are hatched. Perhaps it may not be a useless hint, that many poulterers permit the gentleman in the gang to acquire too long a beard. Eight females with one male, a year old, are sufficient to raise from eighty to one hundred turkeys. Should mustard be scarce, lettuce may be substituted.

AUNT BETTY.

THE MINER'S SAFETY LAMP.

Extracted and abridged from Parkes' Chemical Essays.

In the history of mining, nothing has perplexed the proprietors of our collieries, or annoyed the workmen, so much as the fire-damp; and yet many thousand men, who had no other way of maintaining their families, were constantly obliged to submit to work in situations of the most imminent danger. It was usual for these poor men to creep with a lighted candle in their hands, inch by inch, as it were, along the galleries of a mine suspected to contain what they call foul air, in order to ascertain its

presence, and guard against its dreadful effects. But notwithstanding all their caution, explosions frequently occurred and the consequences were often of the most melancholy kind. The miners, with the horses and machinery were sometimes thrown through the shaft into the air, and these individuals, who might happen to escape the violence of the concussion, were often gradually suffocated in being obliged to breathe the carbonic acid gas and azotic gas, which always remains in the mine after such explosions. Great numbers of men and boys are sometimes killed on such occasions; and not long ago no less than ninety-six persons, who were working in the Felling colliery were, in an instant, destroyed by a similar accident.

Sir Humphrey Davy undertook to investigate the nature and chemical properties of the fire-damp for the purpose of endeavoring to arrest its action, and prevent the ravages which it occasions. During his experiments he found that the fire damp is light carbonated hydrogen, or hydrogen gas holding carbon in solution; that it will not explode unless mixed with a portion of atmospheric air; that it explodes with most vehemence when mixed with seven or eight times its volume of air; that it retains its explosive power when mixed in the proportions of only one of gas to fourteen of air; and that when the atmospheric air is in greater quantity, the light of a taper merely becomes enlarged when brought within it, and that effect is perceptible even in a mixture of thirty parts of air to one of gas. He found also that the fire-damp is much less combustible than other inflammable gases; that it is not exploded by red-hot charcoal or red-hot iron, though iron at a white heat will explode; and that "on mixing carbonic acid with seven parts of an explosive mixture of fire-damp, or one part of azotic with six parts, their powers of exploding were destroyed."

In the prosecution of these inquiries he found it difficult to explode the mixture of air and fire-damp in small tubes; and that in tubes of only one seventh of an inch in diameter, and open to the atmosphere it could not be inflamed, and especially if the tubes were metallic.

In reasoning upon these various phenomena it occurred to him, as a considerable heat was required for the inflammation of the fire-damp, and as it produced in burning, comparatively a small degree of heat, that the effect of carbonic acid and azotic, and of the surfaces of small tubes in preventing its explosion, depended upon their cooling powers,—upon their lowering the temperature of the exploding mixture so much that it was no longer sufficient for its continuous inflammation.

This idea led to an immediate result—the possibility of constructing a lamp, in which the cooling powers of the azotic and carbonic acid formed by combustion, or the cooling powers of the apertures through which the air entered or made its exit, should prevent the communication of explosion.

"I made," says Sir Humphrey Davy, "several attempts to construct safety lamps, which should give light in all explosive mixtures of fire-damp; and after complicated combinations I at length arrived at one evidently most simple,—that of surrounding the light entirely by wire gauze, and making the same tissue feel the flame with air and also emit light.

"In plunging a light surrounded by a cylinder

linder of fine wire gauze into an explosive mixture, I saw the whole cylinder become quietly and gradually filled with flame; the upper part of it soon appeared red hot, yet no explosion was produced.

"It was easy, at once, to see that by increasing the cooling surface in the top, or in any other part of the lamp, the heat acquired by it might be diminished to any extent; and I immediately made a number of experiments to perfect this invention, which was evidently the one to be adopted, as it excluded the necessity of using glass or any fusible or brittle substance in the lamp, and not only deprived the fire-damp of its explosive powers, but rendered the fire-damp itself an useful light."

"It was found that iron wire gauze, composed of wires from one fortieth to one sixtieth of an inch in diameter, and containing twenty-eight wires or seven hundred and eighty-four apertures was safe under all circumstances; and this material Sir Humphrey Davy was therefore induced to adopt for the construction of lamps in coal mines.

"Twelve months after the adoption of this lamp by the miners an important addition was made to it, founded entirely on a new principle. Sir Humphrey Davy having been told that the perfect safety which attended the use of this lamp, often induced the men to go into more explosive atmospheres than they otherwise would, and that this sometimes occasioned the lights to be extinguished, the genius of our philosopher enabled him, by means of the metal called platinum, to obviate the inconvenience in the most complete manner possible. Knowing that platinum has a small capacity for, and is a very slow conductor of heat, in which respects it is not analogous to any of the metals except palladium, it occurred to him, that upon those properties of this metal he might have found the improvement he was in search of. Pursuing this idea he contrived to suspend a coil, or little cage of small platinum wire, from one sixtieth to one seventieth of an inch in thickness, over the flame of each lamp; the effect of which is, that the moment the light is extinguished by an increased quantity of fire-damp in the atmosphere, the coil of platinum wire becomes of an intense red heat; and this affords light enough to enable the men to find their way through the different passages to the entrance of the mine. This alone would have been an important improvement on the original safety lamp;—but this is not all; for as soon as the workman arrived at a part of the mine in which the atmosphere is in a state of greater purity, or where it contains less than one fourth of its volume of carburetted hydrogen gas, than the heated platinum wire of itself re-lights the lamp, and the men are enabled to return to their work with perfect safety. There is another advantage attendant on the use of the platinum, viz: that the red hot coil of platinum wire consumes the fire-damp without the lantern, and this without flame; yielding only a beautiful light by the ignition of the charcoal, which is one of its component parts. It is also to be observed that a candle will burn in one of these lanterns, made safe with metal gauze, as well as in the open air; and that whenever the fire-damp is so mixed with the external air, as to render it explosive, the light of the safe lantern will be extinguished, and

warning will thus be given to the miners to withdraw from, and to ventilate that part of the mine. Another important circumstance, connected with the use of the safety lamp is, that the men can never be in danger with respect to respiration, so long as the platinum continues ignited; for even this phenomenon ceases when the foul air forms about two-fifths of the volume of the atmosphere; and before this it may be breathed without injury.

"At first the miners were apprehensive respecting the durability of the wire gauze; but time has increased the confidence of these men in the apparatus, which has now been in use about five or six years in the most dangerous mines in Britain, and exposed to all circumstances which the variety of explosive mixtures can occasion. And the idea of the wire gauze burning out, is shown to be unfounded; for the carbonaceous matter, produced from the decomposition of the oil, tends not only to prevent the oxidation of the metal, but likewise revives any oxide already formed; and this coal matter, when the fire-damp is burning in the lamp, chokes the apertures of the cylinder, and gradually diminishes the heat by diminishing the quantity of gas consumed.

"The brass collar of the wire gauze cylinders is secured to the bottoms of the lamps by locks which can only be opened by the lamp-keeper; so that the workmen cannot either by accident or carelessness expose themselves to danger by separating the wire gauze cylinders from the bottoms of the lamps.

"After finishing their day's work, the colliers bring their Davys, as they call them, to the lamp-keeper's cabin, who, unlocking them, takes the bottoms into his own possession, and allows the colliers to take the wire gauze cylinders home for the purpose of cleaning them thoroughly. When the colliers return to work the following morning, the lamp-keeper having replenished the lamps with oil and cotton, lights them and screws on their tops, and then examines them with the utmost care, before he delivers them for use; but if the least injury or defect appears in the gauze, or in any other part of the lamp, it is immediately set aside to be repaired, and the person to whom it belonged is supplied with a perfect one."

We have gone somewhat at large into the history and merits of this invention, although it is foreign from the main objects of our publication. Our motive is to show that new things may be useful things, and that a philosopher in his closet may contribute more to the benefit of mankind, than a host of men who toil without thought, and tread in a beaten track, merely because it is beaten, without knowing or attempting to ascertain whether they are proceeding in the most direct path to the objects of their pursuit. Sir Humphrey Davy's talents and perseverance have not only developed new resources to Great Britain, provided bread for thousands who must otherwise have swelled the enormous pauper list of his country, but saved the lives of multitudes, who in all human probability, would have suffered by what has been aptly denominated "one of the most dangerous elements which human enterprise has hitherto had to encounter."

J. & J. A. Muir & Co. of Greenock at present [April 26, 1824] employ no fewer than 1100

of the inhabitants of the Orkneys in the manufacture of straw plat for ladies' bonnets, and have recently turned their attention to an article in imitation of Leghorn plat. After trying various grasses, they have finally adopted the straw of rye, and have this season laid down several acres of that grain, for the purpose of prosecuting this enterprise. They have already prepared a sufficient quantity of the plat to commence a regular manufacture of bonnets, and the article they produce is equal to the finest description of Leghorn bonnets.—*London Farmer's Journal.*

Custom of Trade.—An action was brought by a man against an honest miller for exchanging flour made from wheat sent him to be ground, and sending back very inferior instead. The only defence that the miller could make was, that it was the custom of the trade.—*ibid.*

Astonishing Instance of Fecundity.—A ewe between the Norfolk and Leicester breed, belonging to Mr. Scaber, of Newmarket, lambd on Monday evening no fewer than five lambs, three ewes and two rams. The ewe and produce are healthy and likely to do well.—*ibid.*

White Flint Wheat.—A new species of wheat under this designation, has been successfully cultivated in Cayuga County, for some years past. Its excellent properties are, its security against the Hessian Fly, the straw being solid 5 or 6 inches above the ground, were the Fly lodges in other wheat, grows rank, ripens soon, requires but 3 pecks of seed, and yields from 25 to 40 bushels an acre, weighing from 60 to 64 lbs. a bushel. This account is given by Mr. Ira Pookins, of Brutus: he thinks the grain a native of the South of Spain, and unquestionably superior to any other species in use in that part of the country.—*N. Y. Statesman.*

Remedy for a Sore Mouth.—Hold in the mouth a strong decoction of hemlock bark; if the soreness extends to the throat and stomach swallow a little of it.—It is presumed the tan operates on the gluten of the skin, the same as in the first of the process of converting raw hide into leather.—*Communicated.*

Messrs. Field and Clark of Utica, N. Y. lately presented to Mr. Clinton a pair of pitchers and one dozen of plates of Staffordshire ware, with devices representing various scenes on the Erie canal, with the following inscriptions: (on one side)

The
Grand Erie Canal,
A splendid monument of the
Enterprise and Resources
of the State of

and civil improvement.

An Address delivered before the Monroe, N. Y. Agricultural Society, at their annual meeting in 1823.

By MR. JAMES SPERRY, President of the Society.

GENTLEMEN,—Another anniversary of this society has brought us together, and it officially devolves on me to address you. I make but one apology for the attempt. Had I been present at your last election, I should not have suffered myself to have been placed in a station which ought to be occupied by an older and more able person. You have my warmest thanks for the distinguished honor conferred, in placing me at the head of an institution, honorable, and capable of being rendered extensively useful.

Agriculture has been justly termed the most essential of all the arts. It has in every age been extolled by poets and orators; and in every region of the earth, where civilization exists, it necessarily occupies a great portion of the human race. It is the basis of all other arts; and the foundation and support of society; the source from which every class of community derives its support. The art of husbandry, therefore, is closely connected with the very existence of the human race; and as it is first in importance, it naturally commends itself to the favorable consideration of all those who have the good of the community at heart. It is laid down as a general maxim, which will admit of but few exceptions, that people, taken collectively, are happy in proportion to the degree of perfection to which their agriculture is advanced.

If then, the science of agriculture is actually so important, it behoves every class of community to aid in its improvement, and to take those measures best calculated to advance the art, and to stimulate the cultivators of the soil to excel in every branch of husbandry.

It was with this view that the several agricultural societies of this state, together with the Board of Agriculture, were organized. The system thus established for the improvement of agriculture stands approved by the great portion of the enlightened citizens of the state, as admirably calculated to obtain the object in view. Yet it is to be regretted that there are some who are opposed to the plan, and consider agricultural societies in general as useless, and productive of no real good; and that there are others who professedly approve, yet do nothing for their support. As no plan for the obtaining of an object, unless adopted and steadily pursued, can be of use, it is desirable that all would enter with spirit and energy into a measure that has for its object individual good and public utility. I shall, therefore, claim your indulgence, while I offer a few arguments in support of agricultural societies, and attempt to show how they may be rendered useful.

A well organized agricultural society, if liberally patronized, is directly calculated to promote the interests of community; first, by originating knowledge in the art of husbandry. Our system of agriculture is defective; its improvement would be more certain, should numbers unite and act in concert, than it would should they act separately. Where numbers unite for one object, pride, if nothing else, must stimulate each to add something to the common stock. Each may contribute a little; and several items, however small, will amount

to considerable in the aggregate. Besides, an agricultural society liberally patronized, may offer inducements for new and useful discoveries. "The art of agriculture can never be brought to its highest degree of perfection, or established on rational and unerring principles, unless by means of experiments accurately tried, and properly persevered in." Experiments will, with proper inducements, be tried; all of which may not be successful and satisfactory, yet some out of the many will be worthy of a repetition, and be adopted into our general system of agriculture.

Again—agricultural societies are important, in as much as they tend to diffuse knowledge on the subject of agriculture generally, among the cultivators of the soil; not only that which may be originated by the members of the societies, but that already possessed by our best and most successful agriculturists. Could the great body of farmers throughout the state, gain the information which is requisite to constitute a good farmer, and be induced to adopt those systems which time and experience have proved to be the most profitable, the improvement would be beyond calculation. This will appear evident by contrasting the result of our general practice with that of a few distinguished farmers.—It is a fact, that some farmers raise treble the amount of produce from a given number of acres, that is raised by farmers in general—at less expense, and on land no better by nature than that of their neighbors. In passing through our country in almost any direction, we frequently see some farms twice as productive as others, with equal natural advantages.—This contrast cannot be wholly owing to indigence or indolence in the unsuccessful cultivator; it proceeds rather from a want of method, or of knowledge—while the greater success must be the result of superior knowledge and practice, which would be equally as successful with many as with a few. It is therefore desirable that every improvement in husbandry, and the most successful practical systems of agriculture, which are known only to a few comparatively, should be generally known and universally adopted: and agricultural societies, if properly conducted, are directly calculated to obtain this object. Farmers are not apt to communicate to the public the result of their experiments, let them be ever so successful, or publish to the world their general system and practice. It has the appearance of egotism: and without some inducement besides that of informing the public, but few communications would be made. By the law organizing societies of this kind, each competitor is bound to give a concise history of the process; to state the quality and kind of soil; what preceded the last crop obtained; how much manure was used, and what kind; when ploughed, and how often; and what the whole expense of cultivation amounts to. This information is given without diffidence; it being made a duty, it loses the appearance of egotism, and the requisition is cheerfully obeyed: and as the inducement offered as an incitement to the performance is gratifying, in an honorable and pecuniary sense, it is hardly possible but that a mass of information must be collected, from which a skillful hand might select much that would be of real use, and of public utility.

Again—agricultural societies are, or may be,

of service, by exciting farmers generally to adopt the improvements of the day—to abandon bad husbandry for good; and by influencing them in some instances to deviate from the path marked out by their fathers, and convincing some that it is possible they may be deficient in the knowledge of an art, in which they have been instructed "from their youth up."—Man is a creature of habit, and tenaciously adheres to the principles taught by his father, without investigation, or determining whether they are founded on a reasonable basis. It is therefore an arduous task to convince him of errors thus long established, however apparent: it requires something more than abstract reasoning; he must have ocular demonstration.—He is more easily convinced by that which he sees and hears, than by information indirectly obtained. It is a fact that farmers, generally, must have some incitement more than the ordinary profits of good tillage, to induce them to make extra exertions in cultivating their lands. We may, therefore, conclude for a certainty, that a society for the promotion of agriculture, if well conducted, may render essential service to community, in this respect. Here premiums are offered for the greatest product; the spirited and enterprising enter the list as competitors, and use extra exertions to excel; and he who obtains a premium is doubly rewarded, while the unsuccessful candidate meets with a full recompense in the crop obtained.—Others take courage, and assert (if they have enterprise) that they are not to be outdone, and enter the list with equal success. In this laudable competition, it is ascertained what can be done, with the knowledge already possessed; and the mind is put in requisition for some improvement of the present process. In this manner knowledge is originated, and inquiries are made for information on the subject; "well tried" improvements are adopted; and farmers become convinced by their own experiments, that it is for their real interest that the cultivation of their land should be more perfect; and by commencing on a small scale, the effect of errors will not be serious, and by perseverance, they will soon be enabled to perfect a system worthy to be adopted generally, in all their agricultural pursuits.

Here the best agricultural products of the county are exhibited as an example and excitement; here we have an opportunity of viewing and comparing the best of our flocks and herds, of different breeds, to ascertain their relative value; and here the farmers and citizens generally assemble once a year, become acquainted, promote kindly feelings among the people of the county, and converse freely with each other on those subjects most interesting to them. What can be better calculated to stimulate us to do than this? What greater excitement to the production of that which is excellent in its kind? And what better opportunity can we wish to learn to do well? If there were no other good resulting from the society than the satisfaction of seeing the best of the county collected together, every man of taste must be abundantly compensated for the small sum required of each for its support.

I think I may say that agricultural societies have already been of service in rendering the pursuits of husbandry more popular than they heretofore have been, and in placing the pro-

tion in the estimation of the people were ought to be, at the head of all others. It is been the case that farmers have educated their sons for far less important pursuits than those of farming, from the mistaken idea that they were more honorable; the learned professions have been crowded to overflowing, and the art of husbandry has not received that attention from scientific men which her importance justly demands. Now, the merchant for his health can cultivate his potatoe plat, and the lawyer and judge, his acre of corn. Science is enlisted for the improvement of husbandry, and the farmer proudly adheres to his vocation, and more contentedly and cheerfully. It is justly acknowledged by all classes, not only an essential but an honorable pursuit.

The arguments in favor of the society as a means for the improvement of agriculture are of equal force to the improvement of manufactures and domestic breeds. The improvement of our stocks of cattle, sheep, and swine, is an object of primary importance, and we cannot consistently boast of independence while we depend on foreign nations to supply us with our necessary clothing. Every exertion ought therefore to be made for their improvement; and our pastures may exhibit the finest animals of their kind, and our families be richly clothed with cloth wrought by the hands of our wives and daughters. Although we might improve in these particulars without the existence of an agricultural society, yet we have no reason to believe that we should as rapidly and generally, and to that degree of perfection, as we should with it.

In fact we have abundant evidence of the usefulness of this institution. Every man of observation and candor is ready to acknowledge. Many improvements are introducing and going into use. Farmers are beginning to see their true interests. Clover is taking place of the enriching and less productive grasses; clover seed is beginning to be raised in considerable plenty, and can be purchased for a reasonable price; enquiries are made as to the best mode of culture; and improved breeds of horses, cattle, sheep and swine, are by some sought after with avidity. These appearances indicate a spirit of improvement; and men of observation date their beginning with the commencement of agricultural societies. It is a fact, that these and other improvements and the spirit of inquiry which begins to be manifested among us, commenced in those districts and counties where agricultural societies first existed. It is likewise a fact with a few exceptions, that those counties which were first in this institution, have taken and still hold the lead in the laudable work of improvement; and is acknowledged by those who are qualified to judge, that agriculture, taken in connexion with stock and manufactures, in Berkshire, where agricultural societies had their origin in the United States, and where one has been in successful operation for 12 years past, has improved at least one half. If these things are so, why do not all whom it concerns, come up to the help of the institution, and exert themselves to render it useful, by endeavoring to excel. If it is deserving of support, it ought to be liberally supported; and it would be an easy matter if all were disposed, to give it such support. One dollar annually from all

those who are abundantly able, and whose real interest would be essentially promoted thereby, would give us a fund of 12 or 1500 dollars a year. This sum suitably appropriated annually for ten years, would yield us a profit of at least 2 or 300 per cent. "It would not be necessary to apply these funds exclusively to the use of premiums; much good might be done by purchasing and introducing the best breeds of stock." In becoming a subscriber and paying the trifling sum required, there would not be the least danger of an individual's suffering loss, if he only resolve as the resolution of every farmer ought to be, *first* to subscribe, (that the Board may know its resources) *then* resolve to be a successful candidate for premium; and if he should eventually fail of his premiums, he would be more than compensated for the dollar given, in the produce of the extra exertion to excel, which that donation may have excited. Let this resolution be extensively and generally manifested among the farmers, accompanied with a spirit of concession, a willingness that the meed of praise should be given to another, if to him it more properly belongs, and we should hear no more doubts and cavillings about the usefulness of this institution.

But it is believed that all have not adopted this course, the only sure and infallible one to render the society extensively useful. From an erroneous idea of the real object of the premium afforded, the course has too frequently been, that of withholding a support until by chance a good animal or crop is obtained, then subscribe and offer it and then withhold until chance should be propitious again. Such narrow policy can never meet the liberal views of an enlightened legislature: it will never promote the interest, nor obtain the object of this institution. An erroneous opinion has likewise too frequently obtained, that all could not be rewarded for the support given, unless all could obtain premiums; "whereas men of genuine patriotism and liberal views, will spurn such mercenary considerations, and contemplate the premiums merely as instruments to excite a spirit of emulation."

But there are many objections raised against this institution, as palliatives, for not giving it support; most of which are more imaginary than real. One is, that it is calculated to favor the rich more than the poor. In one sense, it may be so considered; but the poor are benefited equally with the rich, in proportion to what they are worth. It is certainly as much for the interest of the *one* as the other, that agricultural knowledge should advance:—And should we consider the obtaining the premiums as the only object, a man who has a farm, if it is small, and his other circumstances not the best, may be equally as successful in a trial for most of the premiums, as he who has a large farm and thousands besides. Success in this respect, does not depend so much on property as on resolution and enterprize. The man, let him be rich or poor, who does not believe that he has as much enterprize as his neighbour, and thinks that he cannot do as well, he most assuredly will not.—No man ever obtained an object, that he did not believe was within his reach. But let him only believe that he can *do* and *obtain*, and be correctly informed as to the course to pursue, and he will seldom undertake without accomplishing.

Another objection to the society is, that the inducement offered for the raising of an extraordinary crop, will influence the farmer to bestow too much labor and manure on a small part of his farm, to the neglect of the other part; and that the crop thus obtained, together with the premium, would not more than compensate for the extra expense incurred. One would hardly suppose it possible that a rational man, and a farmer too, would make so flimsy and inconsistent an objection as this; yet, strange as it may appear, this objection is urged with a good degree of assurance, and with more effect, perhaps, than any other. If the inducement offered for an extraordinary crop should induce farmers, generally to cultivate no more of their land than they could cultivate in such manner as to obtain the greatest possible net profits, and neglect the other part so much as to stock it down with clover, an important object in our general system of farming would be obtained. It is a fact, generally speaking, that too much of our land is under the plough, that it is continued there too long, and that the cultivation is not so perfect as it should be. It is likewise a fact, that many of our farmers are in the habit of ploughing most of the land they have, that will answer to plough, year after year, and hire pasture and buy hay for their cattle. And it is a fact likewise, that hay has for three years past commanded a higher price by the ton in this village than corn, when one ton of corn cost as much labor, and is worth more than four tons of hay for feeding stock. The reason of this is obvious: too much of the *one* is raised to the neglect of the other; too much land is impoverished by constant ploughing, and not enough is growing better, by the rich sward grass or clover. There is therefore not much danger, and certainly no need of neglecting one part of a farm, by giving the other more perfect cultivation. Neither is there danger of bestowing more labor and attention, by enriching and tilling land well, than the crop is worth. The earth always pays well, with interest, those who treat her properly, and do not *mock* when they attempt her cultivation.

There are many other objections made of not as much weight as those noticed, and although urged with much assurance, are hardly worth a reply. One withholds his support because lawyers and merchants, and other men not accustomed to the plough, belong to the society; and concludes, as they cannot teach him "how to raise potatoes," a society to which they belong cannot benefit agriculture. Another condemns the institution for his failure in an attempt to manufacture a fine piece of cloth—for his mistake in judging that the fineness of the thread was the only requisite to ensure him the award of a premium. Another because the opinion of a committee and his opinion as to the merit of an animal do not coincide. Another because our whole system of agriculture has not been renovated at once. Another because agricultural societies have recommended, in some instances, the raising of vegetables unworthy of cultivation. And another, because designing and dishonest men, in some cases, have imposed upon the society, and obtained premiums by deception and false statements.

That there are obstacles which impede the successful and uninterrupted progress of the society, and that there are difficulties to surmount,

is not denied. But these are by no means conclusive arguments against the institutions. There are no institutions, moral or political, but what have their impediments. Even the institutions of government and of common schools, have many obstacles to impede their uniform operations; but perseverance and amendment surmount them all. Indeed, every human undertaking is defective; imperfection is stamped on man's best performance. We are not therefore to condemn the institution, because it is not perfect in its operations—because it has not yet, in its infancy, fortified against every imposition, and selected the best objects, and those only which are worthy of patronage, for the award of its premiums.—Time and experience it is hoped will rectify errors, and render it more acceptable to its friends, and less obnoxious to those who have as yet been opposed to it.

These observations are made, although in weakness, and by some may be considered premature, with an anxious hope that the society may receive that patronage which its importance demands. Every farmer, without exception, who is able, ought to be a member; and every other man, whose interest is promoted by the improvement of agriculture and the mechanic arts. Those best qualified to judge on the subject are confident in the belief, that could the society receive a liberal support, and continue in successful operation six or eight years, it would be fixed and permanent beyond the least danger of declension. Every farmer would "cling to it as his best friend;" and every other man, let his occupation be what it may, who lives on the productions of the earth, and loves the good things thereof, would rejoice in its prosperity, and give it a cordial support.

(To be continued.)

NEW ENGLAND FARMER.

SATURDAY, JUNE 26, 1834.

FARMER'S CALENDAR.

SHEEP SHEARING. As soon as the weather becomes warm and settled, it will be proper to attend to the important concerns of washing and shearing your sheep. Dr. Deane observed that "we shear our sheep in general too early in this country; the approved time of shearing is from the middle to the latter end of June." They should be washed in a warm time. After this they should run three or four days in a clear pasture, before they are shorn. It is good for them to have time to sweat a little in their wool, after washing.* As this season has been uncommonly backward, we presume few farmers, who are in the habit of "working it right" have yet washed or sheared their sheep, and of course this article will not be mis-timed.

In washing sheep to prevent danger from exposure, sink a tub or a barrel for the person to stand in. "The water must be warm as can be had, and perfectly clean."* Mr. Livingston supposed it not expedient to wash Merino sheep, nor indeed any sheep, whose wool is thick and close. "The long, strait wool soon dries, and therefore the sheep are less injured by it. But when the water is made to penetrate to the skin through a thick close fleece, it will re-

main wet a long time, and I think cannot fail to injure the sheep, which are very subject to colds in the head, chills that penetrate the limbs, and falling on the bowels, bring on a lax which sometimes kills, and never fails to weaken them extremely."

"Another evil, which is little attended to, is the bringing together a large flock of sheep in a stable or close barn, and keeping them together till the whole are shorn. If there are any disordered sheep in the flock, they communicate their complaint, if contagious, to the whole flock, who take in each other's effluvia at every breath they draw. But independent of this, their being heated in this manner, and immediately after stripped of their clothing, cannot but be very hurtful to them. In Spain it is a common practice to keep the sheep closely confined, in order to make them sweat, with a view to increase the weight of the wool, and to make the shears enter easier. The consequence is, that many die; and in some instances one half of the flock have been carried off in the space of a night. I cannot but believe that this injudicious management and folding have generated that great catalogue of maladies, that prevail among the sheep of Europe, but most of which are happily unknown in America. I would therefore recommend, when the shearing commences, that the sheep be penned in the open air, and brought by six or eight at a time into the barn. If the flock is large, draw up only one portion of them, and let the rest feed abroad till wanted. The time of shearing must be regulated by the state of the weather and the growth of the wool. If the sheep begin to lose their wool, and this does not arise from bad keeping, it will be found, on examination, that it is protruded by a growth of young wool; there would then be some loss by deferring the shearing, as the new wool will injure the old, and the next year's crop be diminished in quantity by the delay. But even this should not induce the farmer to shear his sheep till the weather is warm and settled. In this circumstance the Merino breed have an advantage over all others. They never shed their wool; and from some experiments which have been made in France, it appears that two and even three years' growth may be had at one cutting without diminishing the quantity. Thus, if a sheep would have given three pounds the first year, if left unshorn, it will give six the next, and nine the following; so that if it was desirable to have Merino wool of ten or twelve inches in length, it could be obtained; but it is a practice that I would not recommend in our warm climate, where sheep must suffer greatly under so thick a fleece, as well from the heat as from the lice that it would generate. It is, however, a great advantage not to be compelled from the falling of the wool, to shear at an inconvenient or improper time; and this advantage is, I believe, confined solely to the Merino breed. How far it may extend to the mixed breed I do not know.*

After sheep are washed, and previous to shearing them, they should be kept some days in a clean pasture, that their wool may imbibe some of the oil, which is lost in washing. This will cause the shearing to be done with more

ease and expedition, and less oil will be necessary to prepare the wool for manufacturing. Great care should be taken not to cut the sheep in shearing, but if this should happen, Mr. Livingston recommends the application of "a little tar from the tar bucket, which contains some mixture of grease, and a little of the dust or charcoal over it." The "Farmer's Guide" advises to use a mixture of tar, fresh butter and sulphur.

It is a common practice, recommended by most writers on this branch of husbandry, to smear the bodies of sheep, after shearing, with a mixture of tar, fresh butter, or other oil substance. This custom, however, is objected to by Mr. Luccock, an eminent English author who says, "the oil which the mixture contains is most certainly useful, but the tar, a dirty and tenacious substance, adheres to the wool so closely as frequently to corrode the hair, rendering the part to which it was immediately applied thin, rough and weak. When affected by the filthy custom of smearing, the pile is incapable of acquiring the softer and more delicate tints, which it is so often desirable to communicate to the different articles of the woole manufacture. A portion of that dirt, which obstinately retains through every previous process, is dissolved among the ingredients of the dying vat, and disqualifies them from communicating that vivid lustre, which they would have afforded to a purer wool, even though the artist supply his pans with a much large proportion of the coloring materials. In the subsequent processes of the manufacture, the filthy staple produces much greater inconvenience, and is subject to more considerable waste than the purer pile, even though we make every reasonable allowance for the weight of dirt which it obviously contains; in the jenny at the loom, the machines employed in spinning and weaving it, more dexterity and patience are required of the work people, and the cloth which it produces is inferior in its quality, at smaller in its quantity than might have been obtained from the same pile in a pure state. These objections to tar, when it is applied to wool as a substitute for the yolk of the sheep are collected chiefly from the clothiers' account of it, and appear abundantly sufficient to prompt him to require a less pernicious mixture. The only circumstance, which can be mentioned as a counterbalance to these objections, is the consistency which it gives to oil or other greasy substances, with which it is mingled, whereby they are retained among the pile, although exposed to the heat of the animal and the detersive influence of the rain. But if it be desirable in all substitutes of this kind to imitate as nearly as possible the combinations of nature, we should apply to the growing pile a thick coating of soap in all cases where the sheep is incapable from the peculiarity of its constitution of yielding a sufficient quantity of yolk to secure a valuable fleece.—Luccock's Essay on Wool.

LICE ON APPLE TREES—AGAIN. We are informed by a farmer, who assures us that he has had much experience in the cultivation of Fruit Trees, that there is nothing like goose oil for killing these insects.—That both he and his neighbors have made use of that preparation for a number of years to their very great benefit.

* Farmer's Guide.

* Essay on Sheep, by Robert R. Livingston, LL. D.

it not only destroys lice, but greatly promotes the growth of the trees, which are anointed with it. Mr. Frey, it will be recollected, (see page 353.) asserted that train oil is "a powerful antidote against lice, but being of a glutinous quality is very detrimental to the tree." Perhaps goose oil is not liable to the same exception. We would not however, be understood as asserting that this substance is in fact a specific against disorder before mentioned; but merely mention it as something which we have heard of, and which may, perhaps, be worth the trial. Should the experiment be made, we should be glad to be favored with some notice of its result.

WATER YOUR PLANTS WITH SOAP SUDS. We have heretofore, frequently recommended the use of soap suds, both as a manure and an antidote against insects. We have received repeated confirmation of the utility of this substance. A gentleman assures us, that it is one of all manures for cucumbers, watermelons, &c. as it not only causes them to grow with great rapidity, but preserves from bugs, worms, &c. You will, therefore, please to bear all this in mind on washing days, and see that *Jemima* commits no wanton waste of this species of property. Preserve it in tubs or other suitable receptacles, and apply it to your plants every evening about sundown, after having been exposed to the heat of the sun during the day.

FIRES.—On Sunday morning last, about 1 o'clock, a destructive fire broke out in a shed adjoining the stable of Capt. Andrew Morton, in Hawley Street, near City Church. The fire was soon communicated to the house occupied by Mr. Morton, which was much injured. Likewise the out-houses, and the large brick dwelling house, at the corner of Hawley and Franklin Streets, occupied by Mr. Samuel Billings, merchant, and Dr. John Jeffries, were consumed—the walls only left standing. Fifteen horses, a cow, a new cart, a booby hut, six or eight sleighs, with the harness, three tons of hay, grain &c. belonging to Mr. Morton, were lost, together with most of the furniture belonging to the dwelling house of Dr. Jeffries. Suspects are entertained that the fire was the work of an incendiary.

Although the following article was published in the volume of our paper, page 123, we think it may be amiss to give it a second insertion at this time. It appears, by its immediately following an account of a calamitous incident above stated, and which all will read, some men may be induced to remember and it may thus save some valuable lives.

How to save Horses from barns on fire.—Horses are frequently burnt to death when barns or stables are on fire, owing to the impossibility of leading or driving them out of the building, while their eyes are dazzled by the blaze. But we are assured that by simply covering their eyes with a bag, a coat, or a pocket handkerchief, they may be led out of danger without trouble or difficulty.

On Wednesday evening last, the Printing establishment of T. H. Carter & Co. situated in Salem-Street, was nearly destroyed by fire. The fire was first discovered about 11 o'clock, and was not extinguished until the Type Foundry and Power Press were ruined, together with numerous founts of type, and stereotype plates. The loss estimated at \$60,000. The amount of insurance on the building and property is \$40,000. This calamity nearly 100 workmen are deprived of employment. The surrounding buildings, by the efforts of the citizens and firewards, were preserved.

"Travels in the Northern States of America."—By Nathaniel Dwight, S. T. D. LL. D. &c.—"This writer is as known in England about 30 years ago, by a descriptive poem upon the Conquest of Canaan, and a dramatic one, entitled "Greenfield Hill," both republished in this country.—More recently his System of Geology has been reprinted here, and with considerable

success. But the work before us, though the humblest in its pretensions, is the most important of his writings, and will deserve additional value from time, whatever may become of his poetry and of his Sermons."—*Quarterly Review*, April 1821.

Strauberies.—A Trenton paper of the 12th inst. mentions, that nearly a half a bushel of *Strauberies* had that morning been gathered in that place from a garden, most of which measured from two and a quarter to two and three quarters inches, and some three inches and a half.

A handsome compliment is paid to Capt. Jones, of the American frigate *Constitution* in the London papers, for the assistance rendered by him in getting off a British merchant vessel, which was driven ashore in a gale of wind in the Bay of Gibraltar.

NEW YORK, JUNE 19.—*Accident.*—Yesterday morning about 7 o'clock, as two men were employed in digging a vault in front of a new building rearing in Franklin street, the earth caved in and completely covered them. One of them, a mason, was taken out in about 15 minutes, and revived. The other, a laborer, who remained about two minutes longer, and is supposed to have sustained some bodily injury, died soon after he was extricated.

Letters from Washington mention, that funds have been placed in the Bank of the U. S. in Philadelphia, for the payment of the awards under the Florida treaty, where checks to a large amount have already been paid. One Insurance Co. in New-York gets \$195,000.—The city of Baltimore \$600,000.—In Boston, the amount of the claims is estimated at nearly \$1,200,000.

Centinel.

We learn from an intelligent young man who passed this place last week, direct from the Osage Nation, that three of the principal persons engaged in the murder of Major Welborn and party, had been sent to Mr. Choteau's trading house, for the purpose of being sent down in Mr. Choteau's boat, to be given up to Col. Arbuckle, who, it has been before stated, had twice demanded their surrender. Unfortunately, however, they did not arrive until one or two days after the boat started, and they have since returned to the nation.—Our informant states, that the Osages are greatly alarmed at the removal of the U. States' troops to the mouth of the Verdigris, which is within 50 miles of their village, and expresses a decided belief, that all the murderers will eventually be given up, without a farther effusion of blood. *Ark. Gaz.*

The person who gave the above information, also stated, that it was currently reported in Crawford county, that some Creek Indians, who have intermarried with the Cherokees, had recently murdered a white man by the name of HART. It is said, that they had stolen some horses from him, and on his demanding them, they took him into the woods, under pretence of hunting the horses, and there murdered him.

We also understand from the same source, that great numbers of the Cherokees are removing west of the line intended for their western boundary, which was run last winter by Capt. Shattuck. It is said that more than one hundred families have removed since the running of the line.—*Arkansas Gaz.*

Rev. Alexander McClelland, late Prof. of the Philosophy of Mind and of Belles Lettres in Dickinson College, Pa. has been elected President of that Institution, in the room of Dr. J. M. Mason, resigned.

The Hon. JOHN QUINCY ADAMS is appointed to deliver an Address before the American Academy of Arts and Sciences, on this, or the next year; and has accepted the appointment.

Improved Bridle-Bits.—William Zollikoffer, M. D. has invented, and intends getting a patent for an improvement on the common bridle-bit—well calculated to prevent the horse from catching it in his teeth, as some horses, more particularly vicious ones, are apt to do—at the same time it gives to the rider more complete control over, and enables him to subdue the most unruly animal. One will be presented by the inventor to the Editor of the American Farmer, for public inspection.

GROSEILLE WINE.

PUT up expressly for families, in kegs of 6 gallons each, and delivered at any part of the city at \$5, 25 per keg. Also in cases of 1 dozen bottles, for sale by the subscriber.

This genuine and excellent article is made by Dr. Benjamin Dyer, of Providence, who cultivates in one field forty-five acres of Currant Bushes; and it is the opinion of men of medical science that the Wine made of the Fruit of the Currant is equal, in all respects, when sold, to the best imported Wines. It is in flavor much like the old Constantia, and were it as dear, and not known to be of home manufacture, no family in the habit of keeping Wine would be without it. It has, in several instances, passed off at parties as foreign Wine of the most delicious character; it exhilarates without producing intoxication, and its effects are peculiarly beneficial to costive habits.—As a Summer Beverage it is not surpassed by any other.

E. COPELAND, Jr. No. 65, Broad-street.

CAUTION TO SINGLE LADIES.

BY T. C. FESSENDEN.

Ne'er wed, with hopes of *managing a fool*,
Lest you be wounded by a blunt-dog'd fool,
United to a simpleton, you'll find,
Folly is obstinate, as well as blind.
Some married men, but so, so, as to sense,
Assume high airs to show their consequence.
I've seen full many a stupid, lordly lout,
With scarcely wit enough to walk about,
Shew desperate valor in domestic war,
To prove he's not the fool he's taken for.
Since courage is indicative of merit,
His fire-side skirmishes display his spirit;
And china, crash'd beneath his churlish care,
Evinces power as well as right of reign;—
And thus makes plain, by dint of brutal force,
The poet *fibb'd*, who said "*a man's no horse*."
Abroad he dares not treat the meanest man ill,
The tiger fawns and crouches like a spaniel;
Pockets all insults, sneaks away from strife,
At home—let's loose his fury on his wife!
The tyrant thus engrafted on the brute
The product is most execrable fruit.

CONSOLATION.

A mistress I've lost, it is true;
But one comfort attends my disaster,
That, had she my mistress remain'd,
I could not have call'd myself master.

EPIGRAM.

On the Marriage of Mr. Jon. W. Honey, to Miss Mary S. Austin.

From sweetest flowers, the busy Bee
Can scarce a drop of honey gather;
But Oh! how sweet a flower is she,
Who turns to honey altogether.

Miscellany.

Taking Testimony in Courts of Justice.—The taking down testimony is so managed as to consume time unnecessarily in our courts. All concerned in a cause must take down and wait for all. Unnecessary matter is set down; for there are seldom more than a few sentences in the testimony of a witness that are material to the cause. But it is to seem very busy in doing something for the client, where in fact nothing is done that leads to an ostentation of taking down even where there is nothing to take. I have actually known this to take place at the bar.

Well; what do you know of this matter?
Why, in fact, I know but little about it.
Stop, stop a little, let me take that down.
Well; you say you know little about the matter.

Nothing at all—only—
Stop, stop, let me take down what you have said—

A thing like this exhausts the patience, yet it is difficult for the court to correct it. It must depend upon the good sense of the counsel themselves to select, and confine their notes to what is of substance in their evidence.—*Modern Chivalry.*

Drunkness.—We do not believe in specifics; but that there is, in many cases, a diseased appetite in the stomach which demands rum, or

some other liquor to satisfy it, seems unquestionable. The following is said, by the Boston Telegraph, to be a cure. There is nothing in the prescription that can do any harm; and it might be advisable for apothecaries to prepare a mixture for those who want it.—*Con. Mirror.*

Important Invention.—Baron Brulh Cramor, a celebrated German, has found out a method of making the most confirmed tippler have the greatest loathing and repugnance to all sorts of spirits and strong liquor. Take one tea spoonful of the tincture of columba, one tea spoonful of the tincture of cascarilla, one tea spoonful of the compound tincture of gentian, a wine glassful of the infusion of quassia, and twenty drops of elixir vitriol; mix, and take twice or thrice a day, and have a jug of cold water dashed over the head every morning coming out of bed, and the feet bathed in warm water every night. Continue this for six or eight weeks. Dr. Roth, of Swinemunde, has succeeded with this remedy in curing many poor creatures, both men and women, who were killing themselves by continual uppling and drunkenness.

Extraordinary Running.—On Tuesday last, a man about thirty years of age, five feet six inches high, started from Bury St. Edmunds, to run against the Phenomena coach to London, and it appears he performed the task in the least time, beating the coach a short distance in the seventy miles. This person appears to have extraordinary physical powers: he returned on Wednesday from London and preceded the coach on its entrance back to Bury. He picks up a few shillings where he can excite attention; and having only one object in view he frequently changes his coach and runs on a different direction.

A pedestrian, named Ford, completed on Saturday the Herculean task of walking 115 miles in seven days. The match was 200 sovereigns, and he won it cleverly.—*Lon. Farmer's Journal.*

Passage to India by the Mediterranean into the Red Sea.—A numerous and respectable meeting has been held in Calcutta, to discuss the feasibility of steam communication with England via Suez. A Committee has been formed who opened a subscription, and resolved to bestow one lack of rupees upon the first individual or company who should make two complete voyages from England to India in steam vessels—the passage in no instance to exceed seventy days, either by the Cape of Good Hope or the Red Sea, in vessels of British Register, and of not less than 300 tons burden.—*ibid.*

Sensibility.—On Friday s'night as the condemned prisoners were entering the goal in this town, one of them, of the name of Bradrum, convicted of burglary was thus accosted by his mother:—"Well boy, what will you be done to?"—"Hanged mother," replied the son. "Well," rejoined the mother, "be a good boy, and don't be hanged in your best clothes, but let me have them." "I had better take your red waistcoat now!"—*Bury (Eng.) Post.*

The late R. B. Sheridan being once on a Parliamentary Committee, happened to enter the room when most of the members of the Committee were present and seated, though business had not commenced; when perceiving

there was not another seat in the room, he, with his usual readiness, said, "will any gentlemen move that I may take the chair?"

The other day an emigrant from New-York met an old acquaintance in one of our street "Hallo," said his friend, "what under the st has induced you to quit New-York?"—"Nothing," said the emigrant, "but her politics—things have got to such a pass there, that I can tell what side I belong to!"—*Detroit Gazette.*

The following (says the Salem Register,) a true copy of an old advertisement, published in this town:—

Ran away from J— W—, Cooper, B—, his house plague for seven long year. He that has lost will never seek her, and to hi that will find her I will give two bushels beans. I have have all my old shoes out doc for joy, and all my neighbors rejoice with r—good ridance to bad ware, so amen.

J— W—, B—, 1770.

SAXONY SHEEP.

On THURSDAY, 15th of July next, at 3 o'clock, M. at the Punch Bowl Tavern, near Boston,

WILL be sold at Auction, an entire flock of S^x ONY SHEEP, consisting of 46 Rams, 25 Ewe and 4 Lambs, just arrived per Velocity from Bremen.

These sheep were selected with great care, by a son fully qualified for the purpose, from among six or ten thousand of the finest sheep in Saxony, and presumed to be decidedly superior to any sheep we have heretofore been imported. The comparative value of Saxony Wool above the Spanish is well known small quantities which have reached this country have been eagerly bought up by the manufacture fine cloths, but the duty imposed by the new tariff, soon prevent further importations.

Purchasers are assured that none of the sheep will be disposed of on any terms, before the above date; and may be examined any time previous to the day of sale at Mr. Perry's, about a quarter of mile from the Punch Bowl Tavern in Brookline, on the road leading to Cambridge.

Catalogues will be immediately prepared and ready for delivery. Conditions liberal and made known the sale.

COOLIDGE, POOR & HEAD, Auctioneers.
June 19.

LEAD PIPE FOR AQUEDUCTS, &c.

THE subscribers being appointed Agents for very best LORING'S IMPROVED LEAD PIPE, have constantly on hand, at their Store, No. 20, Merchants' Row, a supply of different sizes and thickness. The manner in which their Pipe is manufactured renders it superior to the English or any other manufacture, and at a low price. Orders for any quantity or size will be executed at the shortest notice.

LINCOLN FEARING & CO.

March 27.

PATENT STEEL SPRING HAY FORKS.

JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring and *Manure FORKS*. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warped steel back do., Bisbee's cast steel polished Shovel—together with a great variety of other agricultural implements. June 1.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at discretion of the publisher,) until arrearages are paid.

NEW ENGLAND FARMER.

PUBLISHED BY WILLIAM NICHOLS, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. II.

BOSTON, SATURDAY, JULY 3, 1824.

No. 19.

[The following observations on *Sheep*, we have been assured are from the pen of a person who has possessed advantages for obtaining a knowledge of the subject of his essay of a very superior nature. The Essay itself appears to indicate that its author has much practical as well as scientific acquaintance with the nature of that interesting and useful animal, which forms one of the richest gifts of Providence to civilized man. The communication is very acceptable to us, and we have no doubt will be highly valued not only by the agricultural and manufacturing portions of the community, but by those who wish well to the prime pursuits of human industry, although they may not be directly or personally concerned or interested in raising sheep, nor establishing or prosecuting any manufactory in which "The Fleeced" forms the staple commodity.]

FOR THE NEW ENGLAND FARMER.

ESSAY ON SHEEP.

BY H. D. GROVE.

Of crossed breeds.

The general rule is that the lamb possesses in equal share of all the properties of each parent. The idea is very erroneous that the size and form are more affected by the one, and the intrinsic qualities of the animal by the other—or although, in the first generations, the resemblance to the parent Ram may be most apparent, it is nevertheless certain that in subsequent years the distinctive qualities of the Ewe will again appear in the offspring. A pure race has been carefully preserved in Saxony wights, as had great influence in improving the native wool by constant crossing with full blood rams. But it is certain that real and durable excellence can only be attained by preserving the ewe blood; and the best proof of this fact is found in Spain itself, where the Leonese flocks will continue to produce 25 per cent finer wool than those of Sozia; although the latter are supplied every year with more or less Leonese rams, and the method of treatment is precisely similar in each.

The improvement produced by crossing, naturally progresses most rapidly where the native ewes are of the best quality, although coarse coated sheep may also be gradually improved on in the same way; but in all such cases the size and form will be as much affected as the fineness of the wool, and all the attempts made to preserve the original size, while the wool as made finer have eventually failed.

In the selection therefore, of a breed, or of a single ram for the purpose of a cross, regard could be had solely to the fineness and colour of the wool—to the firmness of its adhesion to the skin, and to the general health of the animal—not at all to the large size; which property will be sure to disappear in the sequel if the wool does not degenerate.

Of the introduction of a pure breed.

The raising of an unmixed breed of sheep superior to the original flock is certainly much more expensive and difficult than improvement by crossing with rams of higher grades

bought singly. It requires a considerable capital as well as very great care and attention.

It is seldom that young ewes are to be had at any tolerable price, and many persons who undertake this business are obliged to content themselves with such as cannot yield more than two, or at most three lambs.

A very important circumstance in a purchase of this kind is to inform one's self about the previous mode of feeding to which the sheep have been accustomed, and if any change is necessary, to introduce it gradually. Better feed will have a tendency to improve a flock, but it is dangerous to make even this change too suddenly.—Those who are able and willing to furnish capital for this purpose and devote the necessary attention to the business will nevertheless find themselves very soon repaid for their trouble and expense; since, in addition to the extra price of his wool, the owner of such a flock will very soon be able to dispose of full blood rams, and, as his flock increases, of ewes also; the price of which, if the best are constantly retained, cannot fail gradually to advance.

To make this business productive it is necessary to pay particular attention to the food of the ewes and lambs, and to have the latter dropped early in the season that they may attain their full strength at the proper period to produce their own young. Rams of inferior grades must of course be carefully excluded from the flock, and the ewes must be treated with extraordinary care to ensure long life and prevent premature barrenness. It is still doubtful whether there is an intrinsic difference in this respect between Merino and other sheep, or whether it is merely owing to the extraordinary attention they have received; but the fact is unquestionable that they usually rear healthy lambs at the age of twelve and sometimes even of fifteen years.

Even if the wool at that age should become a little less fine, the animal must not on this account be discarded, because if the blood remains unmixed this evil will cure itself. If these rules are carefully observed, the increase of a flock of fine blood may be made very considerable as will appear by the following estimate.

Commencing with 12 yearling ewes I estimate that each will bear one lamb the first subsequent season and as many the second, and that half of these are ewe lambs. The third year 9 ewe lambs may be expected, the fourth 12, the fifth 18, and the sixth 22. Supposing that the oldest ewes have now become barren, the same progression will give, at the end of sixteen years from the purchase, a flock of 367 ewes of pure blood, and the low estimate of 6 lambs in all from each ewe is so much within bounds as fully to offset the chances of loss from disease or accident, if good care is taken in managing the flock.

The first purchase of ewes of pure blood will obviate the necessity of subsequent purchases of rams from time to time, which is absolutely necessary in a mixed flock to prevent the wool from degenerating; and a further profit results from the sale of the rams which may commence with the fourth or fifth year.

On the selection of sheep for breeding.

The most important point is to be certain of the pedigree of the animal to be bought, and a sheep known to be of pure blood should always be preferred before another of finer fleece and better form, whose ancestry is uncertain. Next in importance are the fineness and elasticity of the wool, the evenness of the fleece over the whole body, the absence of hairs—the strong, compact form—and full health. The best sheep are distinguished by full and bright eyes, bright red veins about the lachrymal glands, a broad forehead, short but stiff ears, a short, thick neck, broad chest, round shoulders, and generally a stout, thick set form, with short legs.

The size of the body is of less consequence than any of these particulars, having much less influence on the progeny than many people suppose. The thickness of the fleece is mainly affected by the quality and quantity of nourishment, and will not continue through many successive generations without care in this point. There are many other marks of a supposed good ram, such as a large tuft of wool on the forehead, a large hanging dewlap, much wool on the hinder legs, three rows of wool round the neck, &c. &c.—but all these or any other similar marks I consider as of no sort of consequence, and believe they may all be found on very inferior sheep.

It sometimes happens that wool growers are more desirous of heavy fleeces than of superior fineness of the wool, and therefore select in preference the largest, heaviest animals rather than those of the finest fleece; but in this case they fail of procuring the genuine merino blood which never reaches to a large stature under any circumstances.

During pregnancy the ewes should be better fed than usual, and this feed should be continued till they are furnished with ample pasture. It is of great importance that the lambs should acquire strength enough very soon after birth to support the bad weather which may follow in the spring—and be able to benefit by the early pasturage, by which means they may be sooner weaned and the fleece of the ewes increased by stopping the flow of milk.

The rams in every flock must of course be kept separate from the ewes and yearlings—the most convenient arrangement is to pasture them with the wethers. One buck is sufficient for about forty ewes. In Spain the proportion is 3 to 100. During the season of impregnation they are fed, morning and evening, with oats.

In the season for dropping lambs the utmost care is necessary, and if the shepherd is not to be entirely depended on, the proprietor should have him constantly overlooked. The birth is commonly easy but often slow. Ignorant shepherds are very apt on such occasions to be aiding in the birth, which is always useless and often very injurious.

It often happens that ewes will not own their lambs, particularly the first they bear; and in this case I would advise to sprinkling a little salt on the lamb which induces the ewe to lick it, after which it will generally allow it to suck. If not, the ewe with her lamb should be placed

in a separate enclosure (of which several should be previously prepared) and fed with the most nutritious fodder, particularly with succulent liquids; that the udder may be uncomfortably distended; and if this is not sufficient she must be tied by the legs till the lamb has been once suckled; after which there will be no further difficulty. The mother's milk is by far the best nourishment for the lambs, and should never be taken from them for other purposes, as is often practised by shepherds. About three or four weeks after birth the lambs should be fed with bruised oats, or oil cakes softened in water, tender hay and well dried red clover, or other similar fodder. In order that the lambs alone may eat their proper fodder an enclosure is made, through the apertures of which they can pass, while the full grown sheep are excluded.

This previous feeding enables them better to support being weaned at the proper time.—The weaning should take place very gradually for the benefit of the ewe as well as of the lamb, and after weaning, the lambs should be kept at a considerable distance from the ewes.

The ram lambs are cut at three or four weeks old, the tails of the ewe lambs are cut off to within about three inches or something less of the body at the same age.

The fodder or pasture of sheep has been found after the most careful experiments to have no effect on the fineness and very little on the elasticity of the wool; but a very important one on the thickness and length and consequently on the weight of the fleece. Its effect on the health and increase of a flock is of course all important.

The most important circumstance in regard to the strength of the sheep is that the supply of food should be equal in quantity at all times, except a little increase during the time of suckling. Even the wool often becomes weak and loose in consequence of sudden changes from plentiful to scanty feed and vice versa. It is therefore essential that the fodder in winter and the pasturage in summer should be provided in such manner as to subject the sheep to no changes of this kind.

A sudden increase of food is very injurious, although sheep may be gradually accustomed to a very plentiful supply, and generally fully repay the additional expense in the increased quantity of their wool. The proportion of time during which sheep may be pastured differs of course in different climates. In Saxony, sheep are kept about five months on winter feed, but good farmers lay in a stock for 170 days to guard against scarcity in case of a backward spring. The excess is never lost, though late fall feed or early pasture in the spring should allow it to be laid up for another year.

Pasturage.

Sheep are seldom admitted to pasture in summer on the meadows, except here and there on the driest and leanest spots, but it often happens that they are driven on in the spring, if the grass starts early enough for them to feed some time and be driven off again four weeks before the cattle are driven on. The sheep receive no injury in this way, provided there are no pools of standing water in the meadow, and they do not remain on it too long. Generally, however, the only pasture they have, is on the drier and leaner soils; particularly on steep

hills, not easily arable nor producing sufficient pasturage for cattle. This kind of pasture is the best suited to sheep, and such land can in no way be so well improved. It often happens however, that such high lands are not without swampy and springy places or pools of water either on the sides or in ravines between the hills; and all such spots are very dangerous for the sheep. All places where water plants are nourished should be carefully avoided, and more than ever during the greatest heat of summer when they are dry from evaporation. They are then more dangerous than ever because deadly vapours are constantly rising through the dry crust that covers them, and oftener than any other circumstance create the rot which it is so difficult to conquer when once its ravages have begun. It is by no means during the growing season that this danger is most to be feared, for at that period the sheep find sufficient nourishment in dry situations and avoid wet spots of their own accord. Merino sheep are doubtless more subject to the rot than the coarser breeds, and therefore require particular care in this respect. All such marshy spots should therefore be carefully drained in places where these sheep are to be pastured. Wooded pasturage affords sometimes very good feed—but if the shade is very close, the grass, though sometimes very plentiful, is not so nutritious as elsewhere and the wool of sheep receives some injury from the deep shade. The young grass on fields in fallow as well as the fall feed after harvest are excellent for sheep, particularly the former.

The best pasture must be reserved for the lambs, the next for rams and ewes, and the poorest for the wethers.

The winter feed consists usually of hay and straw only. The best hay is well dried, early fresh meadow hay, which should be mowed as young as possible, and not cut on marshy places. Clover, Lucerne, &c. if well got in, are preferable to other grasses.

Straw intended for sheep must also be got in dry and sweet. It is nourishing only in so far as it is mixed with weeds, unripe ears, and heads not thoroughly thrashed. The best straw is therefore to be found on the worst managed farms. Perfectly clean straw affords almost no nourishment, except a little in the joints;—but it aids in digestion and helps at least to fill the stomach.

The stalks of peas and beans are more succulent, but there is a great difference between such as are mowed before they are fully ripe and those that are dry before mowing. In the former case they make very good fodder—though hay is preferable. The usual calculation is two or three pounds per day of dry fodder for a full grown sheep, but many farmers give less than a pound of hay, and make up the deficiency in straw and pea vines. A flock may be kept alive on this fodder, but without mixing some grain or at least half-thrashed straw with it, it is impossible that a flock should go on improving in quality, notwithstanding the greatest care in other respects. The most economical method, considering the increased weight of wool which may be produced by it, is to give the sheep as much dry fodder as they will readily eat. If hay alone is used, at least two hundred weight is necessary for each sheep;

and if a few peas and summer straw are added the supply will be ample for the winter.

Potatoes, turnips, carrots and many other roots furnish excellent fodder for sheep; of which it is unnecessary to speak at large, the circumstances of each farm being the best guide as to their use.

Salt is required by sheep at intervals during the whole year, but it is often given in too great quantity and almost forced upon the sheep, which is always injurious, and often injures the digestion so that the best grain will pass through them unaltered. The best mode, where rock salt is to be had, is to attach pieces here and there in the stable or the pasture and let them lick it as they wish. The usual calculation is from one to two pounds yearly per head, but I have found that something less than one pound was quite sufficient and more than this is not given in Saxony to the best managed flocks.

It is very important that sheep should be furnished with clear water to prevent their drinking from stagnant, muddy pools, which almost always occasions disease. If there is no running stream in their pasture they should be watered as often as twice a day from a well.

The principal requisites for the stall or shelter for sheep are dryness, airiness, and sufficient room. They are very little liable to injury from cold. Lambs, however, should be protected from extreme cold for a few weeks after birth.

Dry fodder should always be put in cribs, and not thrown on the ground or barn floor.

The best method of washing wool previous to shearing is to wet the fleece thoroughly on the previous evening by immersing the animals repeatedly in a stream of water, in order that the dirt adhering to the wool may be softened and more easily removable on the following day, when the principal washing is to be done. Care must be taken that the sheep do not swallow any water during the process. Three or four days after the washing, when the wool has been thoroughly dried, and after the natural moisture has begun to reappear, the shearing may be commenced.

(To be continued.)

An Address delivered before the Monroe (N. Y.) Agricultural Society, at their annual meeting 1823. By Mr. JAMES SPERRY, President of the Society. [Continued from p. 382.]

OBSERVATIONS ON TILLAGE AND FARMING.

Good tillage consists in ploughing and fitting land well for the reception of seed; and good farming, in keeping a farm in repair, and adapting our system to the nature and extent of the soil, and in determining on a rotation of crops which may keep the whole in such state of fertility as will reward our labors with abundance. The height of good farming would therefore be, in so cultivating our land as to obtain the greatest possible yield, and this without exhausting the soil, beyond a good fertile state we should however regard economy in the pursuit of this object, so much as to pursue that system which would be attended with the least expense, in proportion to the profits realized. It is well known to the most superficial observer, that although good land may yield abundantly for several years in succession, that a constant succession of cropping will

must the soil so much that it will yield but little more than to defray the expense of cultivation. It is therefore an inquiry of great importance, a correct answer to which, it is the interest of every farmer to obtain, what system shall be adopted to gain the object in view? then shall we plough land of this and that description? what crop shall we raise first? what ought to succeed; and how long may ploughing be continued; and when should land be seeded with grass or clover, that the whole system taken together may yield the greatest nett proceeds? These are important questions, not only to every farmer individually, but so far as the public are interested in the prosperity of individuals, to community at large. And I think probable there are but few farmers who are not ready to give answers; although perhaps, they would differ widely in material points, and equally diverse in the result, if accurate experiments were made on their several systems.

I make no pretensions to superior knowledge in the art of husbandry, over my brother farmers, but the system that I prefer, I will offer, and briefly attempt to vindicate. I would, however, first take a view of the present practice of most us, in order to contrast that with what I should consider to be the most beneficial, if generally introduced.

I think it probable there is not much diversity of opinion as to the treatment of land newly cleared of timber. It is generally conceded that the first crop ought to be wheat together with clover or timothy seed; and thus seeded, permitted to lie in pasture or in meadow, owing to circumstances, until the roots are well rotted in the reception of the plough.

The management of green sward, and the rotation adopted within the circle of my acquaintance, generally is, first, summer fallowing for wheat; second, spring ploughing for corn; third, oats, flax or peas; fourth, wheat again; fifth, rye; sixth, corn again; and so on, until the land is quite exhausted, and very little: it is then seeded with clover, and permitted to lie in pasture several years, to regain its strength and fertility, and become prepared for another rotation. I would observe, however, to our credit, that some begin to sow a little from this, as it respects the time of us continuing the process, before seeding.

The system and rotation which is recommended by the first agriculturists of the state, beginning with green sward, and which I think, by its economy, is entitled to our confidence and attention, is, first, late fall ploughing, for corn or potatoes; second, spring ploughing, for peas, flax, and other spring crops; third, fall ploughing, for wheat, at which time, or the preceding spring, seed with clover, to lie several years to pasture or mowing, for another rotation. By contrasting the systems with care and attention, it may easily be determined to which the preference belongs.

The first begins with green sward, by summer fallowing for wheat. For this process, at the season of the year in which this work is generally performed, requires two yoke of oxen, and sometimes, if it be very dry, three yoke necessary; and for a team of that description a driver is indispensable.

In the latter system, the commencement of the sward is late fall ploughing. One

yoke of oxen, this season of the year, will generally plough green sward with as much ease as two will in June, and perform as much in a day. There is therefore a saving in this system in the first process, to wit, breaking up, of one yoke of oxen, at least, and a driver, per acre, as one acre per day, and do the work well, would be a good day's work.

Again; to summer fallow green sward, and such sward as most of our pastures and meadows contain, to wit, spear-grass, two ploughings and often three, besides breaking up, and much harrowing, are necessary, to render the ground mellow and fit for the seed. The harrowing necessary on this, would be more than sufficient to fit the fall ploughing completely for corn. Here again is a saving of a man, a yoke of oxen and plough, two days per acre, in fitting for the first crop; which, at \$1 50 per day, amounts to three dollars. This sum added to the saving in breaking up of a yoke of oxen and driver at 75 cts. per day, makes \$3 75 per acre saved, if the amount of produce is equal to that of summer fallowing—a sum equal to the rent of good land.

But this is but a small item in the amount saved by this system. To summer fallow, the land of course must be without a crop one season. It is ascertained by chemical experiments, (and every man of nice observation must know it to be a fact,) that while vegetable substances are rotting or decomposing, much of the fertilizing properties evaporate and are lost, unless they be taken up by the roots of plants growing within reach. If the decomposition takes place on the surface of the earth, but a small portion of the virtues of the substance as manure are saved.

It is likewise well known, that well-rotted manure loses its virtues constantly and rapidly, while exposed to rains and the intense heat of a summer's sun. We may therefore count, in addition to the savings of this latter system already mentioned, the nett proceeds of the first crop obtained. We have good reasons for believing that the rich gases of the decomposing sod, which evaporate and are lost on the bare fallow, would be abundantly sufficient to grow and bring to perfection an excellent crop of corn, or other spring grain; and that land thus treated, would be in as good condition for the production of the next succeeding crop, as it would have been had it been cultivated as a bare summer fallow; for in the latter system the sod (which, when decomposed, is a highly fertilizing manure) is beneath the surface, and there continued till the crop is perfected: the decomposition is gradual, and in the course of the season, complete; the earth above it becomes saturated with its fertilizing properties, while the crop is grown and perfected by that which would have been lost, had the sod been thrown up while decomposing, and exposed to the rains and sun.

(To be continued.)

New process for tanning Leather.—We have examined a sample of leather tanned in a new mode, by Capt. Charles Munroe, of Northboro', in this county, which is pronounced, by competent judges, to be of the first quality. The sample is calf skins, and was tanned in ten days. By the same process heavy upper leather is thoroughly tanned in from 25 to 30 days, and dry hide sole leather in 90 days. We understand

that Phineas & Joseph Davis, of Northboro', who are well known to be extensively engaged in tanning, having adopted this mode, and are perfectly satisfied of its superiority. By it, the expense is somewhat reduced, and the capital employed, may be turned much oftener, than in the old way. Sole leather may be tanned three times, upper leather six times, and calf skins nine times in a year, in regular business, with no danger of failure or injury to the leather. The liquor for tanning is used cold.

We would recommend this improvement to the attention of tanners generally, not doubting, from the recommendations we have seen, of its great practical utility. Capt. Munroe is proprietor of the patent right for this State [Mass. Spy.]

From the Massachusetts Yeoman.

The reader will find on the first page, an article by Dr. Fiske, of this town, relative to the "English breed of hogs," wherein he controverts the opinion of the writer of an article, heretofore published, on the same subject; and maintains the superiority of that breed. The following communication from the same gentleman, furnishes additional proof of the correctness of his opinion.

MR. DENNY,—Since my communication for the New England Farmer, Col. Ward has furnished me with other facts, favourable to the "English breed of hogs." Two of the pigs, mentioned in the lot which obtained the premium at our last Cattle Show, were slaughtered at eleven months and one day old. One weighed 411 lbs. the other 384 lbs. Mr. Rice, a joint owner, who had the particular care of them, is confident that he obtained this weight with less expense than it cost him to make 300 lbs. from the "old-fashioned kind."

If any further evidence was necessary to establish their credit, it need only be mentioned, that the Hon. Judge Lincoln, an excellent judge in all matters, is rearing several litters from my stock, and has recently purchased one from my pen, to transmit the breed.

O. FISKE.

June 28, 1824.

The article alluded to was published in the New England Farmer, vol. ii. page 369.

Western Salt.—We learn from the Troy Sentinel, that a boat has arrived in Troy, from Salina, with 900 bushels of Salt. The cargo was purchased by Messrs. Silliman and Grant, one of our most active and enterprising mercantile houses, and they have contracted for large quantities more. The salt is made by Mr. Byington, who has pans enough in use, we understand, to turn out 2000 bushels a month, and he is making very large additions to them. The salt is of a most beautiful clear white complexion; the crystals are large enough to rank as coarse salt, and are uncommonly pure. We have no doubt that this salt will preserve meat as effectually as Rock salt, or any other whatever, taking an equal quantity of each.—*Buffalo Journal.*

Rapid Weaving.—Messrs. Richardson & Whitaker, of Providence, R. I. at their manufacturing establishment in Attleborough, under the superintendence of Mr. Zeba Bliss, wove on 20 Power Looms, week ending June 12th, 6656-2-4 yards No. 14, 3, 4, browe Shirts, —*Taunton Reporter.*

From the American Farmer.

ON THE DISEASE IN HORSES GENERALLY CALLED THE "BIG HEAD."

Lincoln County, N. C. May 26th, 1824.

MR. J. S. SKINNER,

Sir,—I observed in the American Farmer of the 30th ult. an inquiry made "as to the cause of, and remedy for the disease called Big head in horses;" also a request that "a description of the disease and its symptoms" should be furnished.

As to the cause of that malady, I cannot presume to give an opinion about it. It would be mere speculation and theory without any certainty.

Neither am I certain that I can recommend any thing which will incontestibly be a "remedy." But as the mode of treatment, or rather the operation, which I have observed to be the most successful, is extremely simple; as it is attended with very little trouble and no danger; and may, and in my opinion will, in many instances, perform an entire cure; I will, therefore, communicate it to you.

In the first place, I will describe the disorder as it has fallen under my own observation, as well as I can now recollect it; for it has been a number of years since I was conversant with instances of this kind, and whilst I was a boy. About twelve or fourteen years since, it was very prevalent in this part of the country, but is now rarely heard of.

Young horses seem to be more liable to this disease than older ones. The disorder does not appear to be contagious, yet when it commences in a large stock of horses many of them are apt to be affected before it is eradicated; and horses brought from a distance to supply the place of those which die, or become useless, are equally subject to the complaint, as those which have been longer exposed to the compass of its influence. It is generally slow and tardy in its operations, both with regard to the subjects attacked by it, and in attacking others; and in this way will remain on the same premises for several years.

The first appearance of the disease, is generally, perhaps always, an enlargement of the part of the head between the eye and nostril, and on both sides. This unnatural bulk continues to increase in size; in some subjects with greater, and in others with less rapidity. After the horse has been for some time affected in this way, the under jaw also begins to exhibit appearances of a like growth and distension,—and I have sometimes known it even exceed the other in the rapidity of its increase. The subject in some instances at an earlier, and in others at a later period of the disease, begins to languish and lose his activity and his strength; the joints grow stiff and unshapely, and the back becomes weak and unelastic; until at length he dies, or, as is more frequent, a period is put to his protracted life by his owner, to relieve him from his hopeless sufferings.

I have examined the skeletons of several horses which had died with this disorder. The bones of the head, particularly of the jaws, were humped up and distended. The surface of the bone, with regard to its solidity and consistence, exhibited a natural appearance, but when broken open, the inner part was distend-

ed and uncompact, and resembled a dry honey comb or pumice stone. The tooth is composed, as medical men say, of three parts, viz:—1st, the enamel, or outer hard covering—2d, the bone proper, which is entirely covered with the enamel down to the gums, and is then inserted into the jaw bone, and with regard to the degree of hardness and consistency, much resembles other bones of the system—and 3d, the nerve, which passes into the tooth, and nourishes it. Now in the skeletons of horses which have died with the Big Head, or Growing Head, I have seen all the bone proper part of the tooth, so much affected as to lose all resemblance to that part in sound teeth. I have observed it exhibit the same appearance and consistence, the same unnatural distension and want of solidity so conspicuous in the bones of the jaw, from which indeed the outlines of that part of it inserted in the jaw, could scarcely be distinguished; they had become so conmingled, and had been operated upon, and vitiated by the disease, so much in the same manner.

Some of the bones in other parts of the system appeared likewise to be affected. Those of the fore and hind legs, were perceptibly vitiated, and some of the joints of the back bone exhibited like appearances.

Having thus given a description of the disease, as well as my recollection serves me, I will proceed to point out the mode of treatment which I consider its remedy.

It is unnecessary to describe the different modes practised by those who profess to cure the complaint, and who, no doubt, have some confidence in the efficacy of their prescriptions. I have known none of them succeed well. At the time when the complaint prevailed in this region, my father lost many horses by it. He made use of numerous applications, and tried many experiments,—fomented the head—extracted the teeth—trepanned the parts affected—burnt with a hot iron, and inserted setons or rowels, but was unsuccessful in every way, until the method which I am about to recommend was adopted. It was suggested to him, if I am not mistaken, by a traveller and a stranger.

From that time, his horses which were diseased recovered, and those which were afterwards taken were also cured, and at length the malady disappeared.

The remedy is nothing more than as follows—

Take a piece of bar iron—have it formed into the shape of a chisel, about two inches wide. Let it be about as sharp as chisels usually are when purchased from the store, or as a falling axe is when finished at the shop, and before it is ground. Heat this in a fire until it is quite red—a blacksmith's fire is best, because most convenient.

Search out a gristle or ligament which extends from near the eye of a horse to near his nostril. This ligament is easily discoverable—for in any horse it is as large as a lady's little finger, and in some larger than the thumb of a dandy. Apply the edge of the heated iron across this ligament, about midway between the eye and nostril, and sever it by burning entirely in two, to the bone. This must be done on both sides of the head.

Let the wound then do for itself. If flies should have access to it, and blow it, and maggots ensue—this will do no injury. The severed ligature should be prevented from re-uniting

again too readily, and the irritated and suppurating state of the wound may be advantageous; and having kept open and sore for some time, it will heal of itself.

If the disease has not advanced far in its progress, the head will now gradually, and so slowly as to be scarcely perceptible, shrink to its natural dimensions. Where it has advanced further, the horse may still become serviceable, but the head may never entirely regain its natural shape.

And there are of course, stages of the disease in which no remedy will be effectual.

I am aware, Sir, that where a distemper has accomplished its ravages and spent its force, that however malignant and deadly it may have been, generally in its progress, yet at this period, some subjects will begin to withstand it, and will recover from its attacks even without the application of any remedy. This may have been the case with regard to the cure I have suggested; and I am far from holding it out as a certain and effectual specific for the disorder. But since the experiment is one easily made, and I do assure you it is attended with no danger, I hope those who have applied to you for information on this subject will give it a trial, and communicate to you the result.

And with the best wishes for their success and your welfare, I am, Sir,

Respectfully yours,
JOHN F. BREVARD.

From the Connecticut Mirror.

The frequent occurrence of mistakes in the collection of roots and plants, in our fields, for medical and culinary purposes, ought to excite the utmost caution in all; and especially ought to induce parents to caution their children absolutely prevent them from collecting plant and roots for any purpose whatever. Plants of very different characters and qualities have a near resemblance, that none but a botanist can distinguish them, with sufficient certainty to render them safe. The names in common use are frequently erroneous, and applied to different plants in different parts of the country. Thus, the plant commonly known and used here as Bittersweet, is not Bittersweet, but possesses entirely different qualities from it, and a mistake might be attended by serious consequences. The name Crowfoot is applied to plants of very different qualities, and mistaking one for another, would produce very distressing effects. The same may be said of Hyssop, Masterwort and number of other plants.

These remarks were suggested by a most distressing mistake of this kind which occurred in this town a few days since. A young lady of delicate health, had been in the habit of using the root of Angelica, to relieve a slight distress at the stomach, to which she was liable. Her brother, as he supposed, procured some for her, which she chewed, swallowing the juice. Soon after, she was affected with dizziness and weakness of the limbs, followed by blindness, and excruciating pain in the stomach with vomiting. A physician was called to soothe her some time after the symptoms commenced and was satisfied that they were occasioned by taking some narcotic poison. Her brother soon procured some of the plant, which proved

be the Water Hemlock, (*Cicuta Maculata*.) At this time she was cold, pale, and horribly sick, and distressed at stomach, vomiting every five or ten minutes, which continued six or eight hours. Her limbs were extremely painful, especially the large joints; her pulse was sixty in a minute, small and soft; pupils dilated and vision indistinct. She soon got relief by the use of remedies, and with the exception of prostration of strength, and a degree of difficulty of seeing, she was well in three or four days.

In the morning succeeding the day on which she took the poison, she had a weakness, weariness, and sense of weight in her limbs, which was indescribable and very distressing.

The Water Hemlock, sometimes called Muskrat Root, Wild Fennel, Water Fennel, Wild Parsley, Snake Weed, &c. is the *Cicuta Maculata* of the Botanists, and not the *Corium Maculatum*, as is generally supposed. It is an umbelliferous plant, growing principally in meadows and low grounds; in its general habit, it resembles Sweet Sicily, for which it is most frequently mistaken. The stem is smooth, round, and hollow, striated, (streaked,) on its external surface, and lined with a white membranous substance within. It rises to the height of three or four feet, and is usually surrounded by two or three smaller stalks, with which it is connected at the roots. The joints of the stem are about ten or twelve inches apart, each joint sending off a branch; the branches enclose the stem at the base, and at the distance of one foot from the stalk, send off smaller, opposite branches.—These are again divided into leaves and branchlets usually in threes, sometimes in fives. The leaflets are from one to two and a half inches in length; the middle one about twice as long as the lateral ones. They are from half an inch to an inch in width, tapering to both ends and very regularly notched; from each notch, a vein runs to the mid rib. The plant flowers from the middle of June to the middle of July, leaving umbels of small, white flowers, resembling the common Caraway. The root is composed of six or eight short, thick branches, of a yellow color and sweet taste.

Wethersfield, June, 1824.

From the Columbian Centinel.

MR. RUSSELL.—I saw in your paper a few weeks since, a notice from South Reading, respecting the injurious effects of cheese, which had been dressed with White Lead. The public should be apprized that this is not the only instance of persons having been poisoned with cheese. A similar one happened in my family about three years ago. The cheese was in its appearance and taste of the first quality. The first time it was used, was when a number of friends called to spend the evening.—Most of those who ate of the cheese were sick, some of them very sick through the night. The family not knowing that it was occasioned by the cheese, ate of it again, and were sick.—About the same time, others in the neighborhood were made sick from eating other cheese, probably from the same lot. Whether it was from lead upon the outside, or from something put into the milk to color it, I am unable to say. From the appearance of the cheese, it was thought to be the latter.

I fully accord with the writer of the article

above alluded to, that something should be done, if practicable, to prevent the sale of such cheese. At least the names of the families to which each lot of cheese is made, should be given by the vendors, that those who will thus endanger the health and lives of their fellow citizens, may themselves suffer the consequences of being publicly exposed. W. P.

N. B. The Philadelphia papers mention that several persons in that city had sickened after eating cheese supposed to have been rendered deleterious by the use of the acetate of lead in its production.

Cheese sometimes dangerous.—Last week a number of persons in Frankfort, Pa. were seriously indisposed, and one of them left dangerously ill by eating of a cheese, bought in Philadelphia. It is supposed the cheese had been covered with lead, the acetate of which is known to be dangerous. A portion of the article was sent to Philadelphia to be analyzed.—N. Y. Statesman.

Important Invention.—The greatest improvement, says a correspondent, we have seen for many years in carriages, is a piece of mechanism called the Safety Drag. On inquiry we find this drag may be applied, in a very simple way, to any carriage, at little expense, and used at pleasure by any person on or in the carriage, without stopping, and taken off in a moment. This drag is to be used when descending a steep hill, or at any time, should the horse run away, two-thirds of the weight of any carriage may be placed on it in a moment. Should a horse fall, pole or reins break, the progress of the carriage may be stopped in a moment. How frequently we read of limbs being broken, lives lost, &c. by stage and other horses running away in the absence of the driver, carriages upsetting thro' the pole breaking, and also from reins giving way, restive horses, &c. What would those whose lives are in such danger give at the moment for the Safety Drag? And how frequently we hear of heavy damages being given against stage coach proprietors after such misfortunes. We hope soon to hear of their being in general use, as they are not heavier than a common drag, and the appearance no way against them.—Scotch paper.

A Mr. Cook has taken out a patent for a mixture to render all sorts of timbers, cottons, silks, &c. incombustible. A solution of pure fixed vegetable alkali is what he has found most proper for the purpose. He observes that ship timbers prepared in the manner directed, will not only be incombustible, but also effectually preserved from the dry rot. He thus concludes, "there are thus three great principles in the application of my discovery, of which I claim the exclusive privilege:—

1st. The application of the alkaline solution in preventing any accidents from calicoes, cottons, muslins, cloths, and linen of every description, bed and window curtains, and sail cloths.

2d. Its application to prevent effectually all wood-work of all sorts, either in buildings or vessels of any description, from being destroyed by fire, either by accident or intention.

3d. The process used to render timber incombustible will, at the same time, completely

prevent the dry rot from ever affecting such timber so prepared under my patent.—*Repository of Arts*, No. 263.

Valuable Improvement.—A machine for making shingles was invented a few years since by Willard Earle, of Athol, in this County, which he has so far improved that it bids fair, soon, to entirely supersede the present mode. The machinery, which is propelled by water, is easily kept in repair, and may be managed by boys, as no part of the work is laborious. By it one person will easily make 3 M. shingles per day. But the greatest advantages to be derived from this improvement, consist in the better quality of the work and in the great saving of timber. The shingles made by these machines are all of an uniform thickness, and are made so perfectly true that a man will lay at least a third more, per day, than of the common kind, and the work, when done, is better and more uniform. We understand the ordinary lots of timber will make twice as many shingles in this, as in the common way, there being no waste made, and timber which cannot be worked in the old way, such as bass wood, pine that will not split, &c. may be wrought by these machines to equal advantage with the best of timber. A single machine requires less than a fourth part of the power usually applied to a grist mill.

The inventor has taken a patent for his improvement, and, we are informed, has orders for machines faster than he can supply them. A considerable number are in operation, and give universal satisfaction.—*Mass. Spy*.

Spontaneous Combustion.—The late destruction of a Manufactory near Germantown, Penna. was caused by spontaneous combustion in waste wool. Though but twenty to fifty pounds had accumulated, yet it produced a most dense smoke, and a gas which took fire like gunpowder. The building was instantaneously in a blaze, and not an article could be saved. The oils used in the waste wool were olive and spermaceti—each kind had been so repeatedly used before without any injury, that no danger was apprehended. Repeated experiments that have been made, prove that linseed oil will regularly ignite with waste wool in twenty-four hours.

[N. Y. paper.

St. FRANCISVILLE, S. C. May 15.

The Crops.—The Cotton and Corn look extremely well. Owing to the prevalence of cold weather at the commencement of the planting season, it was feared that the Cotton crop would be very short; but the fine weather that has prevailed for the last ten or twelve days, has wrought an effectual change in the appearance of the fields: Cotton has turned from the sickly, fallow hue it wore, to a lively green; and the stunted fields of corn, from which the disconsolate planter but lately calculated on plucking nothing better than a beggary crop of rubbings, have sprung into new life, and flatter the eyes of a hungry observer with a fair promise of an ample yield.—*Charleston Courier*.

Col. Levi Finney, of Shrewsbury, Vt. sheared from a four year old Native Wether, a few days since, eleven pounds and one ounce of wool. The wool was about ten inches long—two years' growth, and of an excellent texture.

NEW ENGLAND FARMER.

SATURDAY, JULY 3, 1824.

FARMER'S CALENDAR.

HAY MAKING. It is a matter of much importance to the husbandman that he should take time by the fore top during the season for making hay. He must drive his business instead of being driven by it. Indolence or improper management in hay-time will soon give a sorry complexion to a farmer's affairs. A day or two lost or misemployed while the sun shines, and your grass suffers for lack of the scythe and the rake, or your grain is going back into the ground, while the sickle is rusting on a peg behind the door, and its owner is asleep or gone a journey, may be the means of introducing Mr. Deputy Sheriff on your premises, who may do more harm than a crop of thistles, or a host of Hessian flies.

It is best, generally speaking, to cut your very heaviest grass first of all, and if it be lodged, or in danger of lodging, or the lower leaves and bottom of the stalks are beginning to turn yellow, although the grass is hardly headed, and appears not to have obtained more than two thirds of its growth, you had better begin upon it. But when you have help enough, and your grass stands up well, you will do best to wait till the blossom is fully formed, and is beginning to turn brown. Clover is the most critical grass, and requires the most attention. "In all cases," says Sir John Sinclair, "clover ought to be mown before the seed is formed" that the full juice and nourishment of the plants may be retained in the hay. By the adoption of this system the hay is cut in a better season,—it can be more easily secured,—and is much more valuable. Nor is the strength of the plant lodged in the seed, which is often lost.

"After being cut, the clover should remain in the swath till it is dried about two thirds of its thickness. It is then not tedded or strewed, but turned over, either by the hands, or the heads of hay rakes. If turned over in the morning of a dry day, it may be cocked in the evening. The hay is as little shaken or scattered about afterwards as possible; and if the weather is good, after remaining two or three days in the cock, it may be carted in to the stack."

It is asserted by the "Farmer's Guide," that "grass will not thrive well that is not mown quite close; and the loss in the crop where this is not done is very considerable, as one inch at the bottom weighs more than several at the top."

The fore part of the season for making hay is, we believe, usually attended with less rain

than the latter part. The days, too, are longer, and the dews are less copious. Farmers will, therefore, find additional motives from these circumstances to industry and exertion in early hay time. Besides if haying is protracted till harvest commences, the business of one season presses on that of another and some crops will be nearly or quite spoiled in consequence of not being gathered in due time. The fore-handed and industrious farmer thus possesses great advantages over one whom indolence or poverty induces to procrastinate the indispensable labors of his vocation.

Great advantages would result to the farmer, particularly in haying and harvesting, if he could form an estimate of the weather so as to be able to foresee with tolerable accuracy what would be its state for a few days, or even for 24 hours subsequent to the period of observation. Dr. Jenner's versified statement of "Signs of Rain" (published in our paper, vol. ii. 238) may prove useful for this purpose, and the rhymes may assist the memory. A certain French philosopher, some years since, published an article, in which he asserted, in substance, that the web of a common spider is a sure index of the state of the air for twelve or fourteen days to come. If the weather is to be fair and calm, the principal thread will be spun to a great length; if on the contrary the weather is to be stormy and boisterous, the thread will be short and thick, and if the spider is seen to repair the damages its slender thread may sustain, you may anticipate pleasant weather for many days. So says the philosopher, but we cannot vouch for the accuracy of his saying. It may, however, not be amiss for the man of observation to pay some attention to this subject, for we know that the instinct of an insect is often more to be depended on than the researches of science.

In this climate, a southerly wind, if it continues stedfast for 48 hours, is generally followed by rain. If the wind, however, shifts its course with the sun, or, as sailors phrase it, goes round with the sun; in the morning blowing from the south, or east of south and changing westerly as the sun advances, it generally indicates dry weather. If the wind shifts in a course opposite to the apparent course of the sun, rain commonly succeeds. If the wind continues southerly, and blows briskly through the night, it commonly, as the phrase is, "blows up rain." This effect of a south wind in this country may be thus accounted for. A southerly wind is a current of air which has its origin in warmer latitudes than those in which we are situated. This current in passing over the ocean imbibes or takes up as much water as air of its temperature can hold in solution. Passing into higher or colder latitudes the air of the current parts with a portion of its heat or caloric, and cannot retain so much water as it held in its outset. Clouds or vapors are therefore formed, and the excess of moisture is deposited in mist, rain, hail or snow, according to circumstances, the season, &c. On the contrary a northerly wind, coming from a comparatively cold latitude, acquires caloric as it advances, and with that acquisition its capacity for holding water in solution is increased. Therefore a northerly wind is a drying wind, and its predominance soon dissipates clouds and introduces fair weather.

But to come down from the clouds to matters more within the reach of the reader. It has been often recommended by writers on agriculture to cart hay, particularly clover, before the stalks are dry, and either to put it up with alternate layers of straw, or to salt it at the rate of from half to one bushel of salt to the ton.

"Salt hay, in this country, has usually been hurt by lying too long in the swaths. The method in which I have treated it for several years, is, to cock it the next day after it is cut, and carry it in, without delaying more than one day, and put a layer of some kind of dry straw between load and load of it in the mow, to prevent its taking damage by over heating. The straw contracts so much of its moisture and saltness, that the cattle will eat it very freely; and the hay is far better than that made in the common way."*

BAD MANAGEMENT IN MONEY MATTERS. There is an error among farmers, who have acquired property, which has a very ill effect both on their own and the public interest. As their money abounds they purchase bank stock, put it out to use, or vest it in some establishment altogether foreign from their proper concern. Some lay it out in buying more land than they can cultivate to advantage, and are thus led to half till their soil instead of cultivating it to profit. A farmer's surplus cash ought, invariably, to be applied to the improvement of his farm till his husbandry is carried to a state of perfection, which is rarely seen in this country. Cash judiciously expended in fencing, subduing, manuring, and erecting necessary and comfortable barns, sheds, &c. may at first seem to lessen a man's capital, but it will eventually prove better than money at interest, and probably soon be worth 20 or 30 per cent. Besides by laying out your money on your own land you get the best possible security, have something to show for what you expend, and must enjoy a degree of satisfaction in dressing dame nature in her best attire, making the valleys laugh, and the little hills on your premises clap their hands. But when your money is all loaned to interest, spent in obtaining mortgages on other men's land, or purchasing bank stock, &c. you act like a miser, and must live like a hermit, with no means of enjoyment, or evidence of property about you, except musty scraps of paper or parchment. You cause no increase of property, do no good to the public with your money, and live to no useful purpose as respects yourself or the community.

* Deane's New England Farmer.

FOREIGN.

By an arrival at New York, London dates have been received to the 3d of May. They contain more news than usual, with the details of events of more or less importance, which given at large would occupy nearly all our columns. We must therefore content ourselves, and attempt to satisfy our readers with such sketches merely, as we can find room for.

An attempt has been made by the Queen of Portugal, and her son, Don Miguel, to effect a change in the Government. The King was placed under duress, and the Prince assumed the power of Regent, appointing a new Minister of Police, and arresting the existing Minister, and a great number of other officers. The Foreign Ministers interfered, and required that the insurgents should issue an order in the King's name, direct-

* It may not be amiss, however, to state in this place, that agriculturists do not altogether agree on this point. In "Memoirs of the New York Board of Agriculture," vol. ii. p. 59, it is asserted that "all the grasses are more nutritious if not mowed until the seed is fully grown. It should not be entirely ripened, however." The Farmer's Assistant tells us that "the best time for cutting hard grass, [timothy] where but one crop is cut in the season, is when the seeds of grass are fully formed, but before they have become fully ripe; but as farmers cannot all cut their hay in a day or two, it is necessary that they should begin at this time, that they may not end too long after it. The same time is also proper for cutting clover; or rather when a part of the heads begin to turn brown. Foul meadow or bird-grass, may be cut much later, without being hurt by long standing."

ing the troops to disperse. This order was accordingly issued, and tranquillity restored.

Some of the Ministers were arrested at a ball given by the British Ambassador. Marshal Beresford was among the first to demand an audience of the King and to assure him of his personal devotion to the administration. The Foreign Ministers on this occasion conducted with great spirit and energy, particularly Mr. Hyde De Neuville, the French Ambassador. It would seem that the efficient body of the kingdom were in favor of the Queen and her party, and that the King was compelled, in order to maintain his authority, to make preparations for seeking an asylum on board a British man of war.

The *Ex-Emperor Iturbide* has left England for Mexico. The vessel in which he embarked had a quantity of military stores on board, and a printing apparatus for the purpose of printing proclamations for circulation in his native country. On his departure he addressed a note to a friend in London stating that his return "had been solicited by different parts of the country, which consider me necessary to establish unanimity there, and to the consolidation of the Government."

DEATH OF LORD BYRON.

On the 9th of April, Lord Byron, who had been living very low, exposed himself in a very violent rain; the consequence of which was a severe cold, and he was immediately confined to his bed. The low state to which he had been reduced by his abstinence, and probably by some of the remaining effects of his previous illness, made him unwilling—at any rate he refused to submit—to be bled. It is to be lamented that no one was near his lordship who had sufficient influence over his mind, or was himself sufficiently aware of the necessity of the case, to induce him to submit to that remedy, which, in all human probability, would have saved a life so valuable to Greece. The inflammatory action, unchecked, terminated fatally on the 19th of April.

There are no letters of his lordship's of a date subsequent to the commencement of his illness. The friends who were near him at the time of his decease, in addition to Prince Mavrocordato, were Mr. Parry, who had organized the artillery and engineer corps for the Greeks at Missolonghi, Mr. Bonrike, and Count Camba. The letters from the last named gentleman first communicated the intelligence to Lord Sidney Osborne, who forwarded it with the kindest attention to the friends of Lord Byron in England, and proceeded from Corfu to Zante, to make whatever arrangements might be necessary respecting his remains.

Lord Byron had succeeded, his friends are informed, in stirring up among the people of the part of Greece in which he had resided, an almost inconceivable enthusiasm. His exertions were incessant in their cause and the gratitude of the people was proportioned to them. His influence was not lessened by being employed often to procure humane, even kind treatment towards the Turkish captives. On the day of Lord Byron's death, and when he appeared in imminent danger, the Prince Mavrocordato wrote to his lordship's friend and companion, Count Camba, requesting that a Committee might be immediately appointed to take the necessary measures for the security of his property; in consequence of which, four gentlemen have been nominated to act until other arrangements can be made.

One of the letters from Corfu, received on Saturday, and dated April 23, states that Lord Byron died possessed of considerable property in Greece, having for some time resolved to pass his life there, and received considerable sums from England for the purpose of investment. The Honorable Leicester Stanhope had signified his intention of leaving Greece for family affairs in this country, but he had received a pressing invitation from Prince Mavrocordato to remain; and Major Hastings, a gentleman who has been for some time, there, has also had inducements offered to him to remain firm to the cause which he had so mainly assisted. We understand that Colocotroni, one of the bravest Greek Generals, but who had thrown great impediments in the way of Greek Independence, by his jealousy of Ypsilanti and Mavrocordato, had endeavored for some time to prevent the employment of foreign auxiliaries. This man, however, being abandoned by his troops, and wandering, it is said, among the mountains, has no longer any influence, and our country-

men in Greece are likely to feel the effect of his disgrace very beneficially for their interests.

As soon as the death of Lord Byron was known, the Greek Government of Missolonghi issued a proclamation, announcing the event as most calamitous to all Greece, and particularly to Missolonghi—who has lost the most munificent of her benefactors. It was decreed that minute guns be fired, public offices and shops closed, every species of amusement suspended for three days—a general mourning worn for twenty-one days, and funeral ceremonies performed in all the churches. A most ready obedience was paid to these orders notwithstanding the Easter holidays were in celebration.

The Memoirs of Lord Byron, from his own pen, are destroyed. They were intrusted to the safe keeping of Mr. Thomas Moore, and designed as a legacy for his benefit; but on hearing of the decease of his noble friend, Mr. Moore, with his characteristic sensibility, had a meeting with a near connexion of his Lordship, and after mature reflection on the contents of the MS. he apprehending that some of the disclosures might give pain to the minds of many persons still living, though no sort of imputation could rest on her brother's memory, Mr. Moore, with a spirit and generosity beyond all praise, placed the MS. in the Lady's hands, and permitted her to burn it in his presence. It ought to be added, that Mr. M. with Lord B's consent, had pledged the MS. to Mr. Murray, the bookseller, and had received 2000l. sterling on it; and the next morning the 2000l. was repaid by the self-dedicated legatee! It is said the last words of Lord Byron, before his delirium ensued, were:—"I wish it may be known that my last thoughts were given to my wife, my child, and my sister."

DOMESTIC.

A Canal from Boston Bay to Ipswich Bay has been recently opened by which between five and six miles may be saved in a passage from Boston to Ipswich and Newburyport. An appropriation of \$6000 dollars was made for this object by Congress.

Useful Bank.—The Legislature of Connecticut, at the last session, incorporated a Bank in Farmington, with a capital of \$500,000, on condition that the institution purchase shares in the Farmington Canal Corporation to the amount of \$100,000, and a further sum of \$100,000, if the Canal Company should require the same; and in consequence to receive a perpetual charter, be exempted from taxation forever, and be allowed to issue its paper to the amount of fifty per cent beyond its capital paid in.

It is rumored that the Lawyers have gathered an abundant harvest by the Spanish Treaty. The claimants are said to have promised them a five per cent commission on the amount of the awards obtained; and it is added that one of the most eminent of our Counselors will receive over \$60,000 for his services; and still further, that the claimants think the money well laid out.

Another fashionable murder.—Letters from Arkansas, state that the Hon. Josiah Selden, a Judge of the U. S. Court for that territory, was killed in a duel by Judge Scott, on the 26th May. He has left a wife and child to mourn his sudden exit; the former, it is said, followed her husband to within a mile of the combat.

Canal Steam Boat.—A Steam Boat, we learn, commenced running on the Erie Canal, between Utica and Rochester, the 9th inst. The fare including boarding and lodging, is advertised at three cents per mile. This is another degree of improvement in our inland navigation of which it was not thought susceptible. The certainty, the cheapness and the comfort, of this mode of travelling, over all others, are evident.

Last year a rattle snake was killed on Bullard's plains, in the parish of Feliciana, which had not less than one hundred and thirty-seven rattles. If generally received opinion, that the number of rattles denote the age of this species of the serpentine race be correct, the snake must have been as many years old as it had rattles. The oldest inhabitants of that section of our state, had never previously seen one with

more than forty rattles. The longevity of the rattle-snake alluded to was perhaps entitled to a pre-emption right from the Land Commissioners at St. Helena Court House, as the first settler of Bullard's plains.

Low. Adv.

Half a peck of new potatoes, the first of the season raised from the balls, by Mr. Gideon Spencer, were sold to Mr. Sanford Horton, on Thursday, for 50 cents. They are said to be the best kind of potatoes raised in this country, and yield the greatest increase.

Prov. Gaz.

ERRATUM.—In the communication from the Hon. O. Fiske, published in our paper of the 14th inst. page 369, first column, an error occurs which it is hoped our readers will be so good as to correct, as it entirely alters the sense of the sentence. As it stands it reads thus, "At our Cattle Show in 1822, the year after mine were exhibited, the two best boars in the pen were of this commixed breed." The word commixed should have been unmixed.

WANTED No. 43, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper.

From the National Gazette.

The celebrated Ventriloquist, Mr. Alexandre, lately paid a visit to Sir Walter Scott, near Edinburgh, and having chanced to mention to his host that he kept an *Album or Scrap-Book*, Sir Walter stepped aside and almost immediately returned to him with the following characteristic lines.

TO MONS. ALEXANDRE.

Of yore, in Old England, it was not thought good,
To carry two visages under one hood:
What should folks say to you, who have faces such
plenty,
That from under one hood you last night shew'd us
twenty!

Stand forth, arch deceiver! and tell us, in truth,
Are you handsome or ugly, in age or in youth?
Man, woman, or child? or a dog, or a mouse?
Are you, at once, each live thing in the house?
Each live thing, did I ask? each dead implement too!
A work shop in your person—saw, chisel and screw.
Above all, are you one individual? I know
You must be, at the least, *Alexandre and Co.*
But I think you're a troop—a assemblage—a mob—
And that I, as the Sheriff, must take up the job;
And, instead of rehearsing your wonders in verse,
Must read you the Riot Act, and bid you disperse.

WALTER SCOTT.

Abbotsford, April 23.

EPIGRAM.

June to her spouse could not bestow
One tear of sorrow when he died—
His life had made so many flow,
That all the briny fount was dried.

Miscellany.

A professional gentleman, who has lately written a treatise entitled the *Art of Preserving the Sight*, relates the following fact, in order to show the danger attending compression of the eyes:—“I was called in some years ago to the case of a strong man, who had always enjoyed most excellent sight until a short time previous, when he had become totally blind from the following incident. One day he happened to be engaged with a party of friends, when some person entered the room without his noticing it, who ran familiarly to cover his eyes with his two hands, desiring him to guess who it was that blinded him. Either unable or perhaps not choosing to guess the person's name, he endeavored to disengage himself from his hands; but the stronger effort he made for that purpose, the more forcibly did the other press his hands upon his eyes, and this so long, and with such deadly effect, that the unfortunate man when permitted, to open his eyes, found himself totally blind although there was no apparent hurt done to the organ.”

Ingenuous Imposition.—A lady lost a gold watch, near Smithfield, a short time ago, which she advertised, offering five guineas reward for its restoration. A fellow, in the garb of a countryman, called at the lady's house, and said that his master, who was a respectable farmer residing in Essex, had found the watch, and that he would be at the Ram Inn, Smithfield, on the following day, when she might receive her watch. His master, he added, would not take the reward offered, as he was in good circumstances, and of such strict honest principles, that it would be repugnant to his feelings for doing what he considered to be only an act of justice, &c. The lady, on hearing this, was highly pleased, and thought that the poor faithful domestic of the honest farmer ought to be rewarded for the good tidings he brought; she accordingly gave him five shillings, and desired him to inform his master that she would not fail of calling on him the next day. She was punctual; but—need we add the sequel? she neither saw the honest farmer nor her watch.

[Eng. paper.]

We have often wondered how it is possible for a physician, who sees in the human frame so many wonderful marks, not only of design, but of wisdom, power, and goodness, and who is so often reminded of the transitory nature of earthly existence, can help being deeply impressed with a sense of religious obligation.—The ingenious arrangement and exact balance of the various muscles,—the inscrutable operations which are constantly going on in the stomach and alimentary canal,—the heart and arteries impelling the vital fluid to every part of the body, and the veins accompanying the arteries to receive the reffluent blood, and convey it back to the heart,—the brain deriving nervous power from the blood thrown to it by the heart, and the heart continuing its motion by the nervous influence which it derives from the brain,—all proclaim, in a language no infidel can resist, the existence and wisdom of the great Designer.—Surely, it seems to us, “an undevout anatomist is mad.”

Boston Medical Intelligencer.

I have suffered by sore feet, occasioned by hard gravelly walks, and by a foot fever in the summer. A British officer told me to adopt the practice of those who have to undergo long marches, viz. to soap the inside of my stockings. I have done so, and experienced a delightful coolness and ease. Let us learn to communicate, and benefit each other: to this no sectarian ever can object.—Men of all persuasions sometimes walk, and are exposed to sore feet. *Ex pede Herculem* is an old adage; how important then is my subject. Your columns must be filled with publick business at the close of the session, or I would expatiate upon the advantages of being sound from top to toe.

[Nat. Journal.]

The Attorney and Physician.—As two of these gentlemen were setting together in a public house, the doctor began to reproach the Attorney with the number of strange words which the law indulges in, viz.—“*Habens Corpus*,” “*feri facias*,” &c. &c. and amongst others, asked what was meant by the words “*Docking an entail*.” “Why, doctor,” replied the attorney, “it is doing what you will not do with your patients—it is suffering a recovery.”

A very ignorant nobleman observing one day, at dinner, a person eminent for his philosophical talents, intent on choosing the delicacies of the table, said to him—“What do philosophers love dainties?” “Why not?” replied the scholar, “Do you think, my lord, that the good things of this world were made only for blockheads?”

Cooper relates the following anecdote.—Passing one day along Broadway, New-York, he overheard a little negro say to a companion in

somewhat a tone of contempt—“There goes Cooper the play actor.” “Hold your tongue,” says the other, at the same time jogging him with his elbow, “you don't know what you may come to yet!”

Curran's ruling passion was his joke. In his last illness, his physician observing, in the morning, that he seemed to cough with more difficulty, he answered, “That is rather surprising, as I have been practising all night.”

GROSEILLE WINE.

PUT up expressly for families, in kegs of 6 gallons each, and delivered at any part of the city at \$3.50 per keg. Also in cases of 1 dozen bottles, for sale by the subscriber.

This genuine and excellent article is made by Dr. Benjamin Dyer, of Providence, who cultivates in one field forty-five acres of Currant Bushes; and it is the opinion of men of medical science that the Wine made of the Fruit of the Currant is equal, in all respects, when old, to the best imported Wines. It is in flavor much like the old Constantia, and were it as dear, and not known to be of home manufacture, no family in the habit of keeping Wine would be without it. It has, in several instances, passed off at parties as foreign Wine of the most delicious character; it exhilarates without producing intoxication, and its effects are peculiarly beneficial to costive habits.—As a Summer Beverage it is not surpassed by any other.

E. COPELAND, Jr. No. 65, Broad-street.

June 26.

SAXONY SHEEP.

On THURSDAY, 15th of July next, at 3 o'clock, P. M. at the Punch Bowl Tavern, near Boston.

WILL be sold at Auction, an entire flock of SAXONY SHEEP, consisting of 46 Rams, 25 Wethers, and 4 Lambs, just arrived per Velocity from Bremen. These sheep were selected with great care, by a person fully qualified for the purpose, from among eight or ten thousand of the finest sheep in Saxony, and are presumed to be decidedly superior to any sheep which have heretofore been imported. The comparative value of Saxony Wool above the Spanish is well known; the small quantities which have reached this country have been eagerly bought up by the manufacturers of fine cloths, but the duty imposed by the new tariff, will soon prevent further importations.

Purchasers are assured that none of the sheep will be disposed of on any terms, before the above date; they may be examined any time previous to the day of sale at Mr. Perry's, about a quarter of mile from the Punch Bowl Tavern in Brooklyn, on the road leading to Cambridge.

Catalogues will be immediately prepared and ready for delivery. Conditions liberal and made known at the sale.

COOLIDGE, POOR & HEAD, Auctioneers.

June 19.

PATENT STEEL SPRING HAY FORKS.

JUST received and for sale at the Agricultural Establishment, No. 29, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Threshing FORKS. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warranted steel back do., Bisbee's cast steel polished Shovels—together with a great variety of other agricultural implements. June 12.

TO PRINTERS.

NOR sale at this Office BALL SKINS, at the usual prices. June 12.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

ESSAY ON SHEEP.

BY H. D. GROVE.

[Concluded from page 386.]

On the disorders of Sheep.

Almost all the disorders which attack sheep are caused by the want, and seldom or never by an excess of activity in the vital organs. The nerves are very susceptible, but seldom act with great force—and whenever they are powerfully excited, this excitement soon passes off and leaves the animal extremely weak. It follows on this that most of the means required for the cure of diseases among sheep should be calculated rather to excite than to allay the activity of the functions of life—a few of the most common diseases among sheep deserve to be particularly noticed.

The Rot

Exhibits itself scarcely at all externally. The wool loses its high colour and tendency to coagulate and becomes watery. The first perceptible symptom therefore is the loss of the bright appearance about the eyes: the lips and inside of the mouth also become pale, as well as the skin generally under the wool. The animal continues to feed well and does not grow thin, although the natural vivacity is diminished and some signs of weakness occur. The disease commonly gains strength in the winter. Watery swellings are formed, particularly under the chin, which are often absorbed and then reappear. Soon after these the animal generally dies without showing any symptoms of violent pain. Ewes attacked by this disease die most commonly about the time of dropping their lambs. The body on opening exhibits copious collections of water about the chest and entrails, the blood is extremely pale as well as the flesh. This disorder is unquestionably caused by feeding in swampy grounds, and a few hours are sufficient to fix it upon a sheep. It is increased by damp, foggy weather, while on the other hand, dry warm weather at high pasture, especially where there are any aromatic herbs, are sometimes sufficient to counteract the first symptoms and effect a cure. This disorder, however, when it has reached such a point that a common observer may perceive the symptoms, is probably incurable. At a very early stage a cure is possible if the flock is kept carefully on high land where aromatic herbs are abundant and particularly among juniper bushes, and in bad weather carefully housed and well fed. Horse chestnuts are an excellent article for fodder in this case also. A mixture of juniper berries, wormwood, sage, catnip, angelica roots, willow bark and other aromatic herbs with a little salt and grain which they will eat of their own accord, or if not, it should be administered in small quantities in the morning before they are driven to pasture. If the rot makes its appearance in a decided manner before the winter sets in, it is useless to attempt any thing more than to fatten the animal soon as may be and sell him to the butcher. The rot certainly is not infectious, and it very

often occurs that only a few sheep are attacked in large flocks; and generally in such cases, if the shepherd is honest, the disease may be traced in every case to some swamp or other wet place where these particular sheep may have strayed.

The Mouth and Hoof Distemper.

These complaints seem to have a mutual connection since the former, which is the mildest, very often precedes the latter. In the mouth the principal evil to be feared is that the sheep become emaciated from the inability to eat. The best remedy is to bathe the part affected with a strong decoction of sage, mixed with an equal quantity of vinegar and a little honey. If the blisters continue to spread, half an ounce of blue vitriol should be added to a quart of this mixture. The disorder in the hoofs is soon discovered by lameness and if this is evidently not produced by any external injury, and especially if several sheep in a flock are attacked at the same time, great care should be taken to obviate the effects of this disorder. The best remedy is a poultice of dough or fat loamy clay which should be applied to the foot by means of a little bag, but not tied hard to the ankle, and kept constantly wet with vinegar, till a swelling appears on the upper side of the foot or in the cleft of the hoof. This should then be opened with a sharp knife and the dead hoof pared off. The wound must be washed with cold water and sprinkled with dry vitriol. The lame animals should remain carefully separated from the sound ones, and the washing and sprinkling with vitriol repeated till the cure is effected. This disease is not only contagious but also infectious in the highest degree and oftentimes so violent as to produce caries in the bone after the hoof is destroyed.

The Itch or Scab.

This disorder is dreaded more than any other, and did in fact more damage in many districts than any other, until the proper mode of treatment was discovered. The scab is certainly contagious and may readily be propagated by merely touching the skin of a healthy animal with matter from a pustule on another sheep—but as far as my observation has extended the infection is not conveyed through the atmosphere, though it often seems to be epidemic, and particularly in very damp summers which affect sheep in many other ways so unfavourably.

It is discovered by the animal's constantly rubbing or scratching itself and making at the same time a peculiar motion with the lips the scabs are sometimes dry and sometimes moist, and spread very rapidly, though the animal continues healthy in other respects, and generally more lively than before. Afterwards however the disorder becomes internal, the sheep becomes emaciated and dies from weakness and pain. If the scab is observed at an early period it may be easily cured or at least prevented from spreading. One of the best remedies is a strong decoction of tobacco to be applied to the diseased parts, after scratching off the scabs with a comb or other instrument. The decoction of tobacco mixed with lime water and oil

of vitriol, and used constantly for some time, will generally effect a radical cure; another excellent remedy is a decoction of hellebore mixed with vinegar, sulphur, and spirits of turpentine. Internal remedies are of no use except when the disorder has induced other complaints by weakening the general health.

The Sheep-Pox.

This disorder is contagious and propagates itself by exhalation from the sick to the healthy animal, but it has not yet been discovered how far these exhalations may extend. If, however, it appears in a neighboring flock, care should be taken to mitigate its effects by a general and careful inoculation, since it is certain that the disorder is less violent if taken by inoculation than in the natural way. The operation is perfectly simple and easy. The animal is laid on its back and held by two or three men while the operator introduces the matter, from a pustule five or six days old, in two or three places between the legs or on the tail. The lancet should be introduced in a slanting direction under the skin about an eighth of an inch, and when it is withdrawn, the skin should be pressed down upon it so as to wipe off the matter and leave it in the wound. A pustule is formed generally in four days, and reaches its greatest size on the sixth, when a few others generally appear near the first.

Soon after this the usual symptoms of fever and general eruption take place, which last is, however, more regular and safe than if the animal had taken the disease without inoculation.

The only care necessary during the progress of the disorder is to keep the sheep in a cool and airy situation. Internal remedies are not required, but the sores should be often washed with a strong infusion of camomile flowers in which a little blue vitriol has been previously dissolved, and afterwards dressed with a salve made of yolks of eggs and turpentine, mixed with a little powdered charcoal.

The Reeling Sickness

Is never infectious, but generally incurable. Its first symptoms are a weakness in the gait and a disposition in the animal affected to remain separate from the flock. The head is thrown into an unnatural posture, generally on one side. The animal then begins to turn round, always in one direction,—stumbles and falls repeatedly, sometimes with the head under the body, then ceases to feed and soon dies.

Lambs and yearlings only are usually liable to this disorder, and very rarely sheep over two years old. The seat of the disorder is always to be discovered on the brain where one or more blisters are formed and filled with a watery secretion.

The origin of this complaint, and of course the proper preventive treatment, remain as yet undiscovered. A cure is sometimes effected by an operation through the skull to let off the water.

The first step in this case is to examine the skull carefully, in search of a soft spot in the bone which usually indicates the spot affected. The skull is then perforated with a trocar, and

complicated by a tube through which the water may escape; after which the tube also is withdrawn and a few drops of the essence of myrrh applied to the aperture. This operation is sometimes successful, but more often the reverse. If it succeeds, however, in only one cure out of five, it seems worth the trial since without some relief the sheep must certainly perish.

Swelled Paunch.

When sheep or other ruminating animals eat more than they can digest the food ferments in the stomach, emitting great quantities of gas which stretch this organ so as to draw together its apertures, the paunch becomes excessively distended, the lungs oppressed, the breath and pulse obstructed, and the death is very sudden.

This effect may be produced by fodder of any kind, but most readily by such as the sheep prefer, especially if they are not accustomed to it. Green clover and lucerne have, therefore, often been observed to bring on this disorder—but it is nevertheless certain that neither of these substances are in themselves injurious, since I have known sheep accustomed to them eat their fill day after day for months together without suffering any ill consequence. Any young green feed is more likely to be hurtful in this way than dry fodder—but only when eaten in excess after long abstinence. If the approach of the swelling is observed by the shepherd in season, it may be prevented by violent friction of the back and belly and driving the sheep rapidly. These remedies are assisted by a previous dose of lime water, which should be repeated half an hour afterwards, taking care that the lime is good and not previously air-slicked.

If the attack is so violent as to leave no time for these remedies, an opening must be made in the paunch with the trocar and sheath—an operation which cannot easily be described but may be exhibited without any difficulty to any person unacquainted with it.

I omit to notice a great variety of other diseases of sheep which I have had no opportunity of attending to personally,—and also the whole series of external injuries to which sheep are liable,—and in the treatment of which each man's experience is his best guide.

Brookline, 1824.

Correspondence.

HORSE RAKE.

To the Editor of the New England Farmer,

Sir,—The letter of yours on the subject of the Horse Rake, ought long since to have been answered. Various avocations have occasioned the delay, but the present is a fit time for the subject to attract proper attention. I have had a horse rake in use for three years. The utility of it, is decided beyond all question. The utility consists in this. The hay can be collected for carting, with more ease and expedition than can be done usually by six men with common rakes. I use it constantly in hay time, and so habituated to its use and convenience are my men, that they have no idea of being without it a single day. The operation is performed by one man to manage the rake, one boy to ride the horse, and a boy to follow the rake and collect the scattered hay that sometimes is left. The horse must be steady and quiet. This im-

plement is used not only to collect hay into windrows, but it answers to collect the windrows into heaps for loading. It will require some practice, to render the management of it easy and expeditious. But when once acquainted with it, no farmer would ever be without it. This rake operates best on smooth surfaces, but may be used by an experienced hand, on stony and uneven grounds and on low meadows. And it may be used to collect cradled oats and barley for binding. It does not usually answer so well for cradled wheat and rye, as the motion of the rake is apt to stir up dust, that injures the grain for bread stuff.

Description of a good Horse Rake.

The head frame is a stick, of slit-work usually of white ash, maple, bass wood or white oak, ten feet long and three and half inches square, of seasoned timber and of as light wood as possible. To contain 28 teeth of white ash, walnut or white oak, two feet long including the tenon in the head, one and half inch deep and one and quarter inch wide and to be made curving on the under side a little, resembling a small sled, the points to turn up a little to avoid entering the ground or hitting stones. The tenon in the head to be a square in a square mortice with a shoulder under side to brace them and to be wedged into the head. The teeth to be placed at equal distances making about two inches and half apart and points uniform and even. On the upper side of the head affix seven standards two feet long at equal distances to secure the hay from falling over. They may be put in with an inch auger of the same timber as the teeth. On the middle of the head fix two curved handles, like those of a plough to guide its operations. These handles must be fixed firm and braced with iron at the head to secure them and the handles a little wider than on a plough. On each end of the head should be fixed a ferule of iron to prevent its splitting; just inside the ferule on a line with the teeth, fix a small sized staple and ring at each end. To these rings, ropes of the size of a cart rope are to be fastened about 19 feet in length, to connect with the collar on the horse to move it. The length of the rope always to be so long as to allow sufficient space for the hay to be gathered betwixt the rake and the horse, which space will depend on the quantity of the hay or crop and the ropes may be taken up or let out as occasion requires. The above handles may be three and a half feet long and formed as on a plough so as to manage the rake easily. In managing this rake, care must be used to see it is always under the hay, and if it slips over it, stop the horse and draw back and start anew. Practice will soon render it easy. If the land mowed has trees, stumps or rocks scattered over it, the head of the rake may be reduced to 8 or 9 feet or so long as to be useful. This implement is exceedingly useful in collecting clover and large crops of hay.—I have been thus particular, that no error in the structure or use should intervene by which the farmer may be discouraged and perplexed, and throw it aside as impracticable or unprofitable. This implement is simple in its form and structure and easily repaired. The expense of such a rake will not exceed 5 or \$6, and usually much less as this implement is among the labor saving inventions, and in fact is so; I have a strong

desire to see it in general use. But this like other changes in husbandry, will be encountered with prejudices, which will yield slowly and not until our most popular agriculturists shall countenance their use. The present state of agriculture in relation to its products, requires all its operations, to be conducted with economy and the least possible expense. The price of labor continues too high and disproportionate to the price of produce. This will remain to press the farmer so long as our country furnishes so many objects of enterprise in roads and canals. It is therefore important, and necessary to success, that every agriculturist should calculate carefully every expense attending his operations, that he may not labor in vain or at a loss. The implements of husbandry are directly connected with this consideration, and too much care cannot be bestowed, in selecting and using such implements only as shall abridge labor and expense and ensure the greatest degree of productiveness.

You will, sir, make such use of this letter to your discretion shall dictate. I shall always be happy to communicate useful improvement such as experience has tested, and no other shall I feel at liberty to offer.

I am, sir, with cordial esteem

and regard, your humble servant.

THOMAS GOLD.

Pittsfield, June 28, 1824.

BOTTLING CIDER.

To the Editor of the New England Farmer,

Sir,—As the time approaches, when those who bottle cider, must be taking some precaution to preserve their bottles from bursting, I take the liberty to suggest to your country readers a method, new, cheap and effectual, for preserving both cider and bottles through the heat of summer. In swamps, springy and cold, great quantities of moss are found, which may be easily gathered. With this cover your bottles just on the ground in the northerly part of the cellar, and with a water-pot drench the moss with cold water once a week, or once perhaps in a fortnight will be sufficient. This I have found from several years experience, a perfect security for the bottles, and much less trouble than any other method I have tried or heard of. It answers all the purposes of burying them; sand; is less work, and leaves the bottles much cleaner. Moss is easily obtained in the country from low, cold lands, and when wet retains moisture long. One covering will answer for two or three years.

Yours respectfully,
WILKES ALLEN.

Chelmsford, June 1, 1824.

To the Editor of the New England Farmer,

Sir,—In August last, I inoculated some Pea trees with buds of a large winter pear, obtained from the Williams farm in Chelsea; and now I observe fruit of good size, on several of the shoots, which are wholly the growth of the season. I should like to be informed how such slips of dame Nature are accounted for.

A BROOKLINE FARMER.

To keep off or drive away Bed Bugs.—Make strong decoction of red pepper, when ripe and apply it with a common paint brush to the joints of the bedstead, wainscoting, &c. where these odious insects usually resort, and it will speedily kill, or expel them.—Am. Farmer.

From the American Farmer.

ON RECLAIMING MARSH-MEADOWS.

The following are the answers of the Corresponding Secretary of the Agricultural Society of Pennsylvania, to inquiries submitted to him by the President of the Maryland Agricultural Society.

With the management of meadow, I am made familiar, by having had nearly a thousand acres of reclaimed marsh, under my control for some years.—To your inquiries I reply:

1. "The height of the bank above the surface of the marsh, its width at the base, and at the top," are accommodated, to the force of the current, the peculiarities of position, affected sometimes by an increase of alluvion on the opposite shore, the interposition of an island, the deposit of a wreck, and always by the materials which the bank is composed. The tenacity of the mud, is an essential item for consideration. If the bank be faced with stone, at the points of most exposure, or be defended by banks, or be protected by such expedients, as tall wharves, or sunken hulks, less width at the base will be required.

2. "The number and size of the sluices," depend upon local circumstances—the comparative height of the circumjacent land—the intervention of small streams, or natural water course, which carry in certain cases, large portions of the water, to few points.

3. The condition of the marsh, the time which must have elapsed before an esculent can be grown upon a marsh, depends upon its relative position, with low water mark—the natural quality of the mud—the diligence, accuracy, and skill, of him by whom it has been managed. I should say three years would be required, for the tolerable melioration of the soil, since the leakage of the banks, the defects in the position of the sluices—the mistakes in the direction of the lesser drains, which experience only can correct, generally defeat the early expectations of profit.

4. I have never seen a "good crop of wheat growing upon any reclaimed marsh." There is no question that bad crops of wheat, have been taken from some of the highest marshes now not far from Philadelphia. The heavy fogs produced mildew, and the superabundant strength of soil caused the crops to run into aw, and to fall. The surface I am told, was "two feet, above the level of low water mark." I am satisfied, that a good crop of wheat, cannot be made upon any marsh, with which I am acquainted.

5. I have seen luxuriant crops of rye, and abundant crops of Indian corn, upon marsh, of which, the surface is about four feet, and a half above low water mark.

6. Such meadow, in the improved parts of this State, is applied almost exclusively, to the production of grass. For this purpose, it produces from eight to nine dollars per acre, on the lease of the strictest kind, prohibited to the use of hay, and admission of horses. Some of the most fertile, which are within three miles of Philadelphia, produce from ten, to twelve dollars per annum. All taxes, excepting the bank tax, and all expenses, attending the repair of sluices, are paid by the tenants. No man cultivates a farinaceous crop, upon this land, but with the view, of reducing the inequalities of surface, or destroying noxious pests, ransomed,

thistles, elders, and other weeds with which it may be infested. Its fertility, appears to be almost inexhaustible. I have known repeated crops of maize, taken in succession. One acre of the best marsh, will make heavy with fat, six hundred pounds of beef, which shall have been put upon it, wretchedly poor, early in May, and be removed as early as November.

7. "Herds grass, or red top," is not allowed to grow upon well drained marshes. It will flourish where no other grass that I have seen, can live. It is much used upon the ill drained meadows of Jersey. I have heard it asserted, and believe, that it may be sown with so much effect, upon very wet meadows, free from rushes, that a waggon may at the end of four years, pass where an ox, with difficulty at the commencement of the term, could have moved.—"Timothy" is valuable I conceive, only for the uses of turf, or road horses. Our graziers, or farmers cultivate it but for sale, unless it be mixed with clover. They consider it, ill fitted for pasturage, as it shoots less vigorously, and less frequently, after having been once cut, than any artificial grass we possess; and they condemn it as affording hay less nutritious, than all, except herds grass. It is sown upon marsh allowed to go out, and to be succeeded, by white clover, and green grass.

8. "Oats" have never been tried I believe, except as a protecting crop, for timothy; when they were depastured, or cut before the grain had been formed.

9. "Potatoes" have been successfully grown, upon very old well reclaimed marsh.

I am with great esteem,

Most truly yours,

JOHN HARE POWELL.

From the New York Statesman.

SEASON OF FRUITS.

The Editors of the New York Gazette and of other papers, who are in the habit of making the mouth water by talking of mammoth gooseberries, strawberries, cherries, plums and peaches, received in the way of presents from their friends, will certainly excuse us for publishing the following note from Mr. Richards, of Newark, New Jersey, accompanying a basket of the finest and most delicious cherries we have ever tasted. Abundantly as our markets are supplied with this kind of fruit, we have seen none which would bear a comparison, either in size or flavor, with those sent to us by our obliging correspondent and friend. It affords us great pleasure to learn, that this excellent variety is to be extensively propagated. While the vicinity of New York already excels any part of the country in the cultivation of good fruit, and an attention to the subject among agriculturists and horticulturists is by no means so general as it ought to be. The Newtown pippin, for instance, is undoubtedly superior to any apple in the world; and yet in how few orchards is it found growing? The labor of a few hours, and a very trifling expense, bestowed at the proper season, would in a short time supply every farmer with an abundance and variety of the most delicious fruits:

Newark, June 22nd, 1824.

GENTLEMEN,—Notwithstanding your markets are supplied with all the choice fruits of the

season, which gives every one an opportunity of procuring such, as best suits his taste, I am induced to believe that a small basket of my "Fraser's Black Tartarian" cherries would be acceptable to you. I do not know that there were any trees of this kind in this place when I procured mine, but since the size and quality of the fruit was known, a great number of persons have taken cuttings from my trees for the purpose of inoculating; and others have procured the trees from the nurseries in the neighborhood of your city. It is a great, as well as a sure bearer, and I can recommend it as worthy of being generally cultivated.

Yours, &c.

LEONARD RICHARDS.

P. S.—The size of this fruit is about four to the ounce, and measures about three inches in circumference.

A Strange Animal.—There was found and taken alive in this vicinity, a day or two since, an animal, which is probably of the class *mus amphibius*, but differing in many respects from any of the genus we have ever seen described by writers on natural history. He is eight inches long from end of the nose to end of the tail, which is about three inches in length—color, deep green—fur, very fine, like velvet—head, small, and joined to the body without any perceptible neck—his nose about an inch in length, and on the end of it a fleshy tube or proboscis, pointed with fleshy projections, eighteen in number, two of which resemble horns—the mouth, directly under the proboscis, and scarcely perceptible—the eyes, not larger than the head of a small pin, and truly microscopic, as is evident from his motions in the water, in catching animalculæ, which he does with great dexterity—the tail, scaly like that of a water rat, and covered with coarse thin hair—the two fore feet resemble those of a beaver, having five sharp claws—the hind feet resemble those of a rat, and both fore and hind legs destitute of fur—nostrils, at the end of the proboscis, resembling those of a hog—ears, none. We have thus described this animal in the best manner we could, with our imperfect knowledge of natural history. We leave it to the learned to determine to what genus of animals it belongs. On this point we are ignorant. We have met with two or three individuals, who pretend they have seen such an animal—one calls it a *Meadow Digger*—one a *Beaver Rat*—another a *Meadow Mole*. But it is agreed by all who have seen it, that it is a very singular animal.—It has excited much curiosity in this neighborhood. The animal is now dead, and its skin may be seen at this office.—*Eastern Star.*

A very light pleasant bread is made in France by a mixture of apples and flour, in the proportion of one of the former to two of the latter. The usual quantity of yeast is employed as in making common bread, and is beat with flour and warm pulp of the apples after they have boiled, and the dough is then considered as set; it is then put up in a proper vessel, and is allowed to rise for eight or twelve hours, and then baked in long loaves. Very little water is requisite none generally, if the apples are very fresh.

It is said that corns on the toes may be readily cured by rubbing them with pumice stone.

An Address delivered before the Monroe (N. Y.) Agricultural Society, at their annual meeting in 1823. By MR. JAMES SPERRY, President of the Society.

[Concluded from page 387.]

In the summer fallow, (if the sod be made of the roots of the spear grass, (and most of our pastures and meadows are bound down with that unprofitable grass,) the decomposition at the time of cross-ploughing is very imperfect. The sod partially rotted is, therefore, while undergoing a thorough harrowing, and afterwards, exposed to the full heat of the sun, to lose the gases already disengaged, and to become dried and unfit for the purposes of vegetation. Two or three ploughings, and as many harrowings, are generally insufficient to break and reduce them to that tilth which land ought to be in for the reception of the seed. They are therefore necessarily permitted to lie on the surface, either dead or green, to impede the growth of the first crop. We therefore have no reason to believe that land is any richer, or in any better condition for the production of a crop, when cultivated as a bare fallow, than it would be were a crop of corn grown while the grass roots were rotting.

The amount of this saving would depend on the goodness of the land, and the season. If the land were rich, and the season favorable, from 60 to 100 bushels of corn might be easily obtained, one half of which, at least, according to the rule of letting ground, would be saved by this process. I raised last season, on a piece of good ground which was broke the preceding fall, 71 1-2 bushels of corn to the acre. The tending was not as expensive as common stubble land. I likewise raised at the rate of 56 bushels per acre on an unproductive part of my meadow, the soil of which was naturally light, yielding grass hardly sufficient to pay the expense of mowing. This year the same ground, with a light dressing of manure, and one ploughing, yielded at the rate of 100 bushels of oats to the acre. On my other piece of corn ground, I raised this year, under very unfavourable circumstances,—a late, wet spring, bad seed, (not more than two thirds of which vegetated,) and a severe drought in June,—30 bushels of peas to the acre. It is now into wheat, with every appearance of being equally as good as it would have been had it been well fallowed. I mention this barely to show what may be saved, and to influence others to abandon the expensive process of summer fallowing.

It is believed that land in good heart well ploughed once, is better than it twice ploughed; as the first ploughing covers the weeds, grass, and remains of the preceding crop, which will naturally benefit the succeeding one. In breaking up, particular care should be taken that the work be complete, and of good depth, and that the furrows be well turned, and no balks made;—it may then be harrowed the succeeding spring, both ways, without disturbing the sod, and until it is of sufficient tilth to receive the seed.—With a shovel-plough, or some other instrument, light furrows may be made 4 feet apart, that rows can be formed both ways; and a shovel-plough is the most suitable implement to plough among corn at the time of hoeing.

This system is not mentioned as new, or unknown to others, but as one entitled to more at-

tention than it receives—one which will assuredly reward our labors with abundance, without exhausting the soil to such a degree as to require heavy dressings of manure to render it productive again. Land worn too long before it is seeded becomes foul, and requires much more labor to obtain a scanty crop, than would be requisite on land in good heart to obtain an abundant one. To the practice of cropping our lands excessively, we may attribute the cause of such quantities of foul wheat being raised—an evil of which the manufacturer justly complains, and to avoid which no pains ought to be spared.

An objection would naturally arise against the system, on account of the expense attending frequent seedings with clover. But this may be easily obviated, by each farmer raising his own seed. A small piece of ground set apart annually for this purpose, would yield seed sufficient for a large farm; and the extra profit realized from this management, would more than doubly compensate for seeding, and other expenses. If any doubt as to the result and saving, let them try the experiment. Good and profitable farming does not consist so much in fitting land for this or that crop well, as in knowing how to manage the whole concern from year to year.

It will be observed that peas are mentioned as a crop to succeed corn, in the rotation recommended. The return they make for the expense of cultivation and harvesting is ample; they are excelled by no grain, except corn for fattening swine; they ripen early, and are harvested before corn is fit for feeding; and as they leave the ground in such excellent order for wheat, they merit the particular attention of the farmer, as an important crop in whatever rotation he pursue. Perhaps as good wheat might be grown next after corn, as next succeeding peas; but the expense of harvesting stout corn, by cutting it up and drawing it off from the ground in season for sowing is a very heavy draw-back from the profits of the crop. This expense is avoided by cultivating peas between corn and wheat; and if it be desirable to seed with the third crop, wheat ought to be the last.

But there is an important objection to the cultivation of peas. Of late years, they are much infested with the bug—so much so that those who have heretofore raised, have abandoned them as an unprofitable crop.—Yet I am of the opinion, that could the cultivators of the pea be prevailed on to act in concert, this objection might be removed.—Entomologists inform us that the pea-bug is propagated only in the pea—the nit is deposited on the pod soon after it is formed, and being hatched by the heat of the sun, eats its way into the pea, and there remains till the ensuing spring, when it escapes and is inoffensive until the pea is in the pod again, and dies soon after the seed is deposited. By observation we have oculary demonstration of the fact. This being the case, by destroying these insects in those peas kept through the winter, the succeeding crop would escape unhurt. This may be effected with ease. Let those designed for seed be put in a barrel soon after they are thrashed, and covered so as to prevent a free circulation of air, and there will be no danger of an escape; let them be thus kept till a short time before sowing, when let the barrel be filled with water, brine,

or weak lye, that the peas may be completely immersed for 24 hours, and the destruction of the troublesome insects is complete. The insects may be seen in and about the fields sown with buggy peas, from the time they are sown till some time after the podding of the pea; it is therefore believed that they do not stray far, and that all who are careful to prevent their escape will not suffer by them.

I had supposed that peas free from bugs, sufficient for seed, might be obtained by sowing late. This belief was supported by a statement made by the Hon. Timothy Pickering on that subject, to the Massachusetts Agricultural Society. But I was unsuccessful, the season past, in an experiment of half an acre of late sowing. These were sown as late as the 27th of June; the first pods were considerably infested, the last were killed by the frost. I would therefore recommend the attempt to secure and destroy the bug before it leaves the pea, as before stated, with a firm belief that the experiment will be successful. I would likewise recommend that the board continue their premium for the best half acre of peas, free from bugs.

The system and rotation recommended in this address, is not pretended to be a perfection. The bare outlines are given; the cultivation of only three of the most important crops is mentioned: time would not permit, were it necessary, to designate further. I would recommend a premium to be awarded at the end of four years to the person who shall offer the best system, beginning with green sward—to be determined by actual experiment, taking into account all the expenses attending the whole process.

Nothing is said in this address of the application of manure, and the use of plaster; it was deemed unnecessary. The main object has been, to lay the axe at the root of the error with which most of us are charged—summer fallowing. This practice, I think—it must be admitted, is erroneous; and the sooner it is abandoned, the better it will be for us. One method of propagating truth is to expose error; and there are many errors of which we are guilty in farming but time will not permit us to dwell upon them. One more, however, must not be omitted. The farmer is guilty of a most palpable error, when he raises rye among his wheat intended for market. Every man of experience must know that wheat in which there is but a small proportion of rye, will make flour of the first quality; and as our greatest surplus article, and that on which we place the most dependence for exportation, is wheat, it is of the utmost importance that we give a character to our flour. Rye cannot be separated from wheat after it is threshed. The machinery of the manufacturer will not do it. We therefore stand in our own light, when we sow wheat that has the smallest mixture of rye. Care should be taken that wheat intended for seed, in particular, should not be exposed in the barn, and liable to receive the scatterings of the rye mow. But care should be ineffectual in this respect, we should not fail, soon after the rye is headed, to pass through the field and take it all out.

Although many who cultivate the earth are of opinion, that the art they profess to understand is susceptible of little or no improvement, a little reflection, and attention to facts, often convinces the best and most successful agriculturists, that the knowledge they possess is not

imperfect. Although many do well, and receive good profits, in the cultivation of their farms, yet there is sufficient room for them to do better. Those who have given the subject the greatest attention, and reduced the science to the most regular and profitable system, still see defects, and learn from year to year.

Situated as we are as to local and natural advantages, with a flourishing commercial and manufacturing village in our centre, through which passes the Grand Canal, the pride of our country and the admiration of the world, and with a fine climate and rich soil, it behoves us, and our real interests prompt us to be diligent and active in the work of improvement. Let it not be said we are inactive and stationary, while our neighbors spiritedly and successfully progress; but rather let us say, that although many counties in different parts of the state have done well, it shall be our aim to excel them all.

From the Massachusetts Agricultural Repository for June, 1824.

ON LINSEED OIL FOR FATTING CATTLE.

Roxbury, May 7, 1824.

TO THE CORRESPONDING SECRETARY,

Dear Sir,—In the spring of 1818 I purchased a large fine looking cow, from the high recommendation of her former owner, as to her valuable milk properties; in a few days after the calving, and her bag was in so bad a state as made it necessary very soon to dry her up, losing the whole object for which I purchased her. Early in the fall having read, in "Voclo on Husbandry," published by an English Farmer in this country about 40 years ago, a Receipt as follows: "the quickest feeding a beast can take is *linseed oil* mixed with bran, if the animal is small, give two pecks of bran per day, divided into three feeds, in each peck half a pint of oil, they eat it very greedily and it feeds them wonderfully fast; they must have what hay they will eat, but that will not be much. The oil dilutes all the rest of the food they eat, and as to itself, it all stays in the beast, as fat, five gallons and the bran in proportion will fatten a beast sooner than five pounds sterling in any other food."

I felt determined to try the experiment on the above mentioned cow—she refused the food for two days, but finding she had none other offered, she afterwards began to eat, and in a short time became fond of it; she increased in fatness very fast. After using the five gallons recommended, I purchased two more, and then for about a fortnight gave her Indian meal, when she was in high order. And I sold her to a neighboring Butcher, (having described to him the manner of feeding,) at nine dollars the hundred pounds, being the price of the very best beef at that time, the weight paid for was seven hundred and ninety-four pounds. I never saw handsomer marbled meat, and he told me his customers were very much pleased with it; and he has very frequently since told me they have often spoken of the goodness of that beef.

Two years after I fattened a pair of oxen, one of which was by the same mode, consuming eight or nine gallons of oil, and afterwards meal for two or three weeks; the other on vegetables and meal. I sold them to a Butcher from Halifax, Nova Scotia, for that market;

they were estimated at 1200 lbs. each—the oil fed one was thought the best, and the expense of feeding was considerably less. I gave this man notice of the mode of fattening both animals, he said he had no objection to the oil, as in England their cattle are fed largely on *oilcake*, and he should bleed this animal a few days before slaughtering. I heard from Halifax that the meat of both was considered excellent. Since then I have not fattened any beef animals, but was so well satisfied, that whenever I do I shall adopt the same method.

Mr. Parsons intends this season, fattening an animal by this method, when he will give the result to the society.

I am, dear Sir,

Respectfully yours,

JOHN PRINCE.

The oil cake, and linseed, ground to a powder, as well as the oil are much used for fattening cattle in England. The enriching of the manure by this means is said to be a sufficient object, were there no advantage in the first cost of the food. A jelly is likewise made from the linseed and mixed with barley meal or with bran and cut chaff.*

There is said to be danger of giving a yellow tinge to the fat by keeping animals a long time on the oil or the cake.

Marshall in noticing the practice in the District of Maidstone, England, of grinding the seed for fodder says—"in the state of powder, it has no degree of clamminess and very little of tenacity; being perfectly dry, with an appearance like ground coffee. It might be perfectly or sufficiently mixed with the flour of pulse or any grain." He recommends this preparation as preferable either to the oil or cake.†

* *Linseed Jelly.* The principal objection to this material is the trouble of preparing it. In an instance in which it was used with success, the method of preparing it was this. The proportion of water to seed was about seven to one. Having been steeped in part of the water, eight and forty hours, previously to the boiling, the remainder was added cold; and the whole boiled gently about two hours; keeping it in motion during the operation, to prevent its burning to the boiler; thus reducing the whole to a jelly like or rather a gluey or ropery consistence; cooled in tubs. Each bullock being allowed about two quarts of jelly per day or somewhat more than one quart of seed, in four days; that is about one sixteenth of the medium allowance of oil cake.—Marshall's Gloucestershire, &c.

† A large part of the flax seed which comes to the Boston market, is raised in New Hampshire and Maine, and most of what is grown in this state is produced in the southern counties.

THE SESAMUM INDICUM;

or Bene Plant, from Africa.

The undersigned has received an additional supply of Bene Seed from the South, and it will afford him great pleasure to furnish a few of them to any person who may want them.

There is no provident family, it is believed, who knew their value, that would ever neglect planting a few of the Bene Seed every season, in some border of the garden, to have fresh leaves always at hand in case of need. Although this plant requires a warm climate to bring its seed to maturity, it will grow well enough in any part of the United States, to furnish its mucilage during the season it is most generally wanted.

One leaf of this plant immersed in a tumbler of spring water, changes it immediately into a fine mucilage, that is perfectly clear, tasteless, and inodorous, and very useful in the summer complaints of children, the dysentery, &c. Sick children take it as they would pure water, and as it is perfectly innocent, they may be allowed to take as much of it as they like. The leaves likewise of the plant dipped in tepid water, before they are applied, afford great relief in cases of inflammation of the eyes. They may be applied also as a dressing for burns, blisters, &c. with advantage.

But the chief value of this plant is derivable from the oil which may be expressed from the Bene Seed, a bland, nutritive oil, that is equal in every respect, it is said, to olive oil.

Southern planters, it is hoped, will turn their attention to this plant, and give us, ere long, more full information respecting it, than we are yet possessed of. In the mean time, a regular supply of the Bene Seed will be kept at this institution, for distribution in small packets, to be sent by letter to all who may apply for them. No charge will be made for these seeds. No letter, however, can be received, that is not free, or wherever the postage is not paid.

JAMES SMITH,

Vaccine Institution, Baltimore.

From the American Farmer.

A new and important discovery in the art of Dyeing—with cheap materials.

Sir,—In the course of last autumn, I accidentally met with some yarn in a family, of humble life, the color of which, attracted my attention, which induced me to enquire the process of dyeing; the information I received was, to cut the end off the largest pumpkin that could be obtained, the seed only taken out, the yarn put in, and as much poke berry juice poured on as the pumpkin will hold, which should be set away in a warm place, the yarn frequently opened, and in about nine days, it produces a permanent and brilliant blue or crimson color; it is to be washed out in soap suds. I am induced to make this communication, thinking it might be desirable to some of your readers. And I have no doubt the chemist might extract from the materials an useful dye for manufacturing on a large scale.

With respect, I am, Sir,

Your obedient servant,

Jefferson, Culpeper Co. }
Va. May 8, 1824. }

Bad Butter.—Being a few mornings since in a store where butter is taken in, we heard a woman ask a shopkeeper what price he would give for a tub of butter which she offered—"Nothing!" was the answer. We had the curiosity to look at it; and a more disagreeable (we will not say disgusting) mass we never saw offered for sale as butter. It is wonderful that any dairy woman should yet be ignorant or careless of what relates so much to her own interest, as the proper management of butter designed for the market. The most usual fault is, that it is not sufficiently worked. If proper attention was given to this part of the process, the butter would command in the market one or two cents more, by the pound, than it usually does.—Mass. Yeoman.

NEW ENGLAND FARMER.

SATURDAY, JULY 10, 1824.

From the Windsor (Vt.) Journal.
HOING CORN.

The following extract from an article published in the New England Farmer, on the subject of hoeing corn and potatoes, is so much at variance with what appears to me to be the more rational theory, that I am surprised the editor of that paper gave it currency without a passing remark:—

"Corn should be hoed the third time or killed, just before the tassels appear.—It should now be ploughed deep, in order that much loose dirt may be left between the rows, which will tend to prevent injury from drought."

Now, it is suggested to my mind, that if the ground be properly prepared before the corn is planted, as it ever ought to be, it should be disturbed as little as possible afterwards to a depth to affect the roots and fibres, which are penetrating in every different direction. A plough the first, and perhaps the second time of hoeing, may do little injury, but by no means should it be used the last time, certainly not to any depth; for thereby the roots, which, at that age of the corn, nearly fill the space between the rows, will be broken and the corn receive a serious check in its growth by the loss of nourishment which these supplied to the stock. Nor do I consider it preventive of drought to plough at all amongst the corn; for if there be danger of suffering on this account, the more and deeper the ground is stirred, the more the danger is augmented. What I would recommend as the best preservative from drought, is the use of *house ashes*, after the first or second hoeing, put in quantities of from half a pint to a pint on each hill. From actual experience and observation, I do not hesitate to recommend this, as the best safeguard for corn of any thing yet discovered.

W.

REMARKS BY THE EDITOR.—We have republished the foregoing article for the purpose of making some comments on Mr. W.'s strictures. We think we shall be able to show, that if our correspondent is in an error he has the sanction of high authority to apologize for, if not completely to justify his observations.

Dr. Deane, in treating of the culture of Indian corn, gave the following directions:

"When the plants are about knee high, and before they send out their panicles or spindles, give them the third and last hoeing. The best way at this hoeing is to *plough one furrow in an interval both ways*. The cultivator, with two mould boards, would be better for this work, than the common horse plough, as it would throw the mould equally towards each row, and save labor in hand-hoeing." &c.

Mr. Butler, the author of "The Farmer's Manual," says, "at your third hoeing or hilling, *strike a deep furrow between the rows, and haul up the earth to the hills with a hoe; but keep your plough as far from the hills as possible, that you may avoid the extended fibres of the roots, which if cut with the plough, would injure your corn*. Avoid the corn harrow at your first weeding, as is practiced by some; this leaves the land close, or heavy and dead between the rows and injures your crop. Be sure that you finish hilling before your crop begins to silk and tassel, (or blow out, and set for the ears;) nature should then be left to herself undisturbed, or your crop will be injured."

The Domestic Encyclopedia, in giving an account of the mode of cultivating Indian corn by Mr. Spurrier, of Delaware, who had made many experiments in order to find the most advantageous mode of tilling this plant observes that "the third ploughing" [after the corn had been planted] "he did as the first, throwing up the mould in the middle of the alley. This is of more use than a person would imagine, for it admits the influences of the air and dews to penetrate to the

roots. The land, upon which Mr. Spurrier tried this experiment, was between a loam and a clay. Sands and light lands will not require so many ploughings."

The Farmer's Guide says, "no crop while growing requires more attention than corn. To prevent it from being stunted at the outset, it is advisable to apply some stimulants to the plants when very young; such as bog-dirt, ashes or gypsum, and this should be repeated at the third hoeing. When the plants are three or four inches high, the plough must pass in the intervals, making two furrows in each, turned from the rows; the weeds killed and a little fresh earth drawn about the plants with a hoe. In about half a month afterwards, plough again, turning the earth towards the rows, and draw up some more earth with a hoe. Just before the corn spindles give it the last ploughing and hoeing, in a manner similar to the last, keeping the plough as far as possible from the hills. Avoid the harrow at weeding; it leaves the earth close and heavy, and injures the crop."

Mr. Curwen, a celebrated English Agriculturist, is of opinion that ploughing among green crops is "preventive of drought," and perhaps his opinion in the scale of authority will weigh as much as that of the gentleman who takes the signature "W." as above. Mr. Curwen maintains "that by constantly turning the vacancies between the roots or beds of green crops, in every direction, he can in dry weather procure for the plants something like a compensation for rain, in the evaporation of moisture from the earth."

"A field of cabbages," continues Mr. Curwen, "were this year set on a very strong stiff clay, which previous to their being planted was in high tilth.—The severe drought which succeeded the rains that fell, soon after setting baked the ground perfectly hard. The plants made little or no progress; they were seen by a friend of mine, on Monday the 26th of May, as I was commencing the breaking of the ground with the ploughs. On Saturday they were seen again by the same gentleman, and he could scarcely be persuaded that they were the same plants. The week had been very dry with a hot sun, and strong north east winds."*

Sir John Sinclair, in enumerating the advantages of deep ploughing says, "Bringing up new mould is peculiarly favorable to clover, turnips, beans and potatoes; and indeed, without that advantage, these crops usually diminish in quantity, quality and value.—2. Deep ploughing is likewise of great consequence to every species of plant, furnishing not only more means of nourishment to their roots, but *above all by counteracting the injurious consequences of either too wet or too dry a season*. This is a most important consideration, for, if the season be wet, there is a greater depth of soil to absorb the moisture, so that the plants are not likely to have their roots immersed in water; and in a dry season it is still more useful, for in the lower part of the cultivated soil, there is a *reservoir of moisture*, which is brought up to the roots by the evaporation, which the heat of the sun occasions."

There can be no doubt but that the leaving of "much loose dirt between the rows" as our correspondent has directed, would prove advantageous to the corn plants. Col. Pickering, in an Address to the Essex Agricultural Society, observes that "Nothing is more common in a dry summer, than the rolling of the leaves of corn; and that circumstance is often mentioned as an evidence of the severity of the drought. The rolling of the leaves of Indian corn, is the consequence in part of scant manuring, but still more of shallow

ploughing. Few, perhaps, are aware of the depths to which the roots of plants will penetrate in a deeply loosened earth. A gentleman much inclined to agricultural inquiries and observations, informed me, near fifty years ago, that seeing some men digging a well in a hollow place, planted with Indian corn then at its full growth, he stopped to examine how far its roots had descended, and he found them to the depth of nine feet. The soil was an accumulation of earth which had run or been thrown into the hollow."

If the roots of Indian corn can penetrate nine feet in a perpendicular direction they would no doubt, pervade every part between the rows. But the third hoeing or hilling should take place before the roots have spread far from the hills; and if this is accomplished "before the tassels appear" we believe there will be but little danger of injury to the roots.

The mode of cultivating Indian corn, adopted by Gen. Hull, and described in the Massachusetts Agricultural Repository for June, 1823, may well be mentioned here, not only as it corroborates our statements, but suggests a new and probably useful idea relating to this branch of husbandry. Gen. Hull says that his corn "was ploughed and hoed three times, and at each time of hoeing the furrows were filled up and the ground left nearly level. The last ploughing and hoeing was the 5th of July."

"As the ground by deep ploughing and hoeing had been rendered loose, I was of the opinion the hills would receive more nourishment and stand stronger, by the roots running underground in the whole space between the rows, than by drawing the rich earth around the hills with the hoe, as is the usual custom. Besides the dews, the light rains and the sun have a much greater effect on the roots, when the earth is banked up around the hill. And further when high hills are made, the roots running horizontally will run out of the ground and perish."

"Every thing which has been anticipated with respect to the manner in which the field of corn had been planted and cultivated was realized. While other corn in the same enclosure and near it, was perishing during the dry season, not a leaf in this field even curled, and no part of it, in the least degree, suffered by the drought. The second week in October it was harvested, and from this seven eighths of an acre, were measured one hundred and ninety-two bushels of ears, after the husks were taken off, equal to ninety-six bushels of shelled corn. The whole was sound, and suitable to grind into meal, excepting three bushels of ears. The value of this corn, including four bushels of beans, raised by way of experiment, was \$122.56; the expense of cultivation was \$57.25—leaving the nett profits of seven eighths of an acre of Indian corn, \$64.31."

The Anniversary of American Independence was celebrated in Boston with the usual festive social and literary rites. Cannon were fired, processions formed, orations delivered, feasts enjoyed, toasts uttered, joy-beaming faces exhibited, every thing animate and many things inanimate bore the impress of Freedom's Natal Day. To give in detail the proceedings would require us to devote all our columns to that express purpose and a brief sketch would convey no ideas adequate to the joyous occasion. We must therefore beg leave to refer our readers to our political papers; merely remarking that it appeared to us that every thing was done which should have been done, and every thing that was done was well done, which was requisite to mark the day with which commenced the era of our National Freedom.

* Curwen's Hints on Agricultural Subjects.

Destructive Fire.—A few minutes before one, on Wednesday afternoon, a fire broke out in a carpenter's shop, at the corner of Chesnut and Charles street, and notwithstanding the most spirited exertions, before it could be subdued, it proved to be the most destructive fire that has been known in this town for many years. We have had no rain for more than a fortnight, so that every thing was excessively dry; and the wind blew almost a gale. The fire soon caught two dwelling houses in Chesnut street, and a block on Charles street, which extended to the corner of Beacon street, and extended for a considerable distance up Beacon street. The whole number of dwelling houses burnt is 15, one grocery, and a carpenter's shop. Some of the houses destroyed are among the finest in town. Two of the houses were on Chesnut street, six on Charles street, and seven on Beacon street. It was only by the greatest exertions that the fire was at length arrested, after raging with unabated fury for more than two hours. The last house burnt was separated only by a brick wall from the next, wind blowing directly upon it, and the out houses were principally of wood. The distant parts of the town were at the same time in no small danger, from the burning flakes, which were carried an immense distance by the wind. We have already heard of a great number of places where the fire caught, out was put before any considerable injury was done.—We are not able to give a complete list of the sufferers; the following is all we have learned.—On Chesnut-street, the carpenter's shop and the two dwelling-houses, were owned and occupied by Messrs. Stoddard and Lincoln. On Charles-street, Messrs. Bailey & Stanford, kept a grocery shop at the corner of Beacon-street, and two dwelling houses were occupied by Messrs. Griggs, Granger, Putney, Smith, Tilden, and Jasses Huse, and perhaps others; the owners we do not know.—On Beacon street, the houses were occupied by Messrs. Bryant, T. Swett, H. G. Rice, W. M. Ot, T. H. Carter, S. Austin, and S. Bean, and most of them were owned by the same gentlemen. A large proportion of the furniture was saved. It was carried upon the Common, where a guard was soon formed for its protection. Immediately after the fire was subdued Capt. Loring, of the New England Guards, volunteered to furnish a guard for this purpose, and issued his orders accordingly; and in forty minutes, forty members of his company were on the ground, and formed a line of sentinels around the property to be protected. About 9 o'clock, they were relieved by the Independent Cadets, who continued the protection as long as it was needed. We have heard several reports as to the manner in which the fire caught. One account attributes it to a chimney—another to a cigar—and a third to boiling glue—but we do not know which is correct. It was doubtless accidental.—*Bos. Daily Ad.*

Solemn dispensation of Providence.—On Wednesday last, about 2 o'clock, P. M. a thunder shower rose from the west, and passed over the town of Rye, lightly charged with electric fluid. The lightning was very vivid and incessant, and the peals of thunder tremendous. The rain descended in torrents. The lightning struck in five places, in two of which it proved fatal in its effects. It struck the south school-house, in which there were about seventy scholars, more than half the number were knocked down, and many were stunned. Eight or ten were unable for some time to rise up; and six or seven, when first taken up by the master, were apparently dead. Twelve or fourteen were more or less injured; the clothes of one took fire, and he was considerably burnt; and the air of another was singed. All, however, recovered, or are hopelessly recovering, except two, who were instantly deprived of life, viz. Sheridan, a very forward and promising son of Jonathan Philbrick, Esq. aged 11—and Joseph Smith, a desirable child of Samuel Randall, aged 7. The lightning entered the school-house at the westerly window—shattered the sashment—broke the glass, and appeared to spend its force chiefly among the scholars; no other considerable effects appearing.—The master, Mr. Fellows, received a considerable shock, but was not so affected, but that he was able to pay immediate attention to the case of his scholars—who is entitled to esteem for his benevolent exertions for their welfare.

About the same time, the lightning struck the

house of Mr. James Philbrick, a mile distant from the School-house. Most of the family were in a chamber—several of them were affected with the shock, and a son of Mr. Philbrick, about 10 years of age, was instantly killed.—*Portsmouth Jour.*

ALEXANDRIA, JULY 2.—On Monday night last, we experienced a fall of rain, preceded by a strong wind and almost incessant lightning and peals of thunder. A father and his child were killed in Baltimore, Md. and one or two persons seriously hurt in Washington, by the lightning. No one, that we have heard of, was injured here.

On Wednesday afternoon, we experienced one of the heaviest storms of wind and rain ever known to our oldest inhabitants. Such was the density of the rain that the atmosphere was nearly as much darkened as by the thickest fog we ever saw. A tree, which, from its protected situation by the buildings, it was thought could not possibly be injured, was blown down in the market square. Many garden trees, &c. in other parts of the town were also prostrated.

There is every reason for the most serious apprehension for the fate of the standing crops of every kind, wherever the storm of Wednesday has been felt; and it is but too probable, that it has not been very limited in its extent.

The following vessels of war, we understand, are now equipping for sea with all possible despatch, to wit: NORTH-CAROLINA, 74, Com. Rodgers; Constellation, 44, Com. Macdonough; Hornet, 22, Captain Kennedy; Ontario 22, Capt. Nicholson; Shark, 12, Lieut. Stevens; Porpoise, 12, Lieut. Skinner; Store-ship De-coy, Lieut. Gamble.

We should presume that a considerable portion of this armament is intended to show itself along the coasts of South America in order to impress the nations there with a proper idea of our naval strength.

Wash. Gaz.

FOREIGN.

London papers to the 1st and Liverpool papers to the 4th ult. have been received in Boston, but contain no intelligence of much importance. The Sun, a London paper, declares that the English Government would not recognize the South American States this year, and attributes the decline of the South American Stocks to a knowledge of the fact. The Courier of June 1, however, says, "we can venture to state that previously to the close of the present session of parliament, a communication will be made on this subject to the House of Commons."

The dissensions and disturbances in Lisbon have terminated in the restoration of the King, and the banishment of the Queen, her son, and her father confessor, the Patriarch of Portugal. The Queen, it is said, will go into a convent, the Prince to England, and the Patriarch to Busaco.

The cause of the Greeks, we are assured, continues to wear a prosperous appearance.

Abraham Bey has rebelled against the Vice Roy of Egypt—taken possession of Cairo—been appointed Vice Roy by the Porte, and Generalissimo of the Ottoman forces.

A Mr. Harris, a new candidate for aeronautic fame, ascended in a balloon, about the last of May, from a tavern near London, accompanied by a Miss Stocks.—When about two miles from the earth he prepared to descend, in effecting which he was killed. He opened the valve at the top, and the balloon descended with surprising rapidity. The noise occasioned by the escape of the gas was terrible. A number of persons ran to the car as it descended, and found Mr. Harris a corpse, and his female partner totally insensible. She recovered from the shock in the course of the next day—and intended to ascend again.

WANTED No's. 1, 23, 24, 25, 26, 27, and 28, of the 2d volume of the N. E. Farmer—for which a generous price will be given by the proprietor of this paper.—Printers who receive the Farmer in exchange will confer a favor by forwarding the abovementioned No's to this Office.

GROSEILLE WINE,

PUT up expressly for families, in kegs of 6 gallons each, and delivered at any part of the city at \$5.25 per keg. Also in cases of 1 dozen bottles, for sale by the subscriber.

This genuine and excellent article is made by Dr. Benjamin Lyer, of Providence, who cultivates in our field forty-five acres of Currant Bushes; and it is the opinion of men of medical science that the Wine made of the Fruit of the Currant is equal, in all respects, when old, to the best imported Wines. It is in flavor much like the old Constantia, and were it as dear, and not known to be of home manufacture, no family in the habit of keeping Wine would be without it. It has, in several instances, passed off at parties as foreign Wine of the most delicious character; it exhilarates without producing intoxication, and its effects are peculiarly beneficial to costive habits.—As a Summer Beverage it is not surpassed by any other.

ODE.

Composed by a member of the corps of INDEPENDENT CADETS, Salem, Mass. and sung at their celebration of our National Independence, July 5, 1824.

Assembled to-day—let us join heart and hand,

While we mingle our joys in the grand celebration,
And our gratitude pay to the patriot band,

Who in Senate and field, were the pride of our nation,
Who rush'd to the strife

When dangers were rife,
And seal'd their devotion with the red streams of life;

For ne'er while our "Star spangled banner" shall wave,
Shall we cease to remember the wise and the brave.

Sound the loud tramp of fame, let its notes be prolong'd,
O'er each name so renown'd for devotion and daring,
Who with swords flashing freedom, to the rude contest
throng'd,

With hearts beating high and their proud bosoms
bating,

Mid the battle's fierce height,
To their foemen in fight,

In defence of their toil-planted homes and their right;
For ne'er while our standard so proudly shall wave,
Shall we cease to remember the wise and the brave.

Those eyes that once beam'd bright with courage, are
clos'd,

Those hearts which beat high, in the grave now are
sleeping,

Those bands that once vanquish'd the foes they oppos'd,
Cold and nerveless have sunk to the grim monarch's
reaping,

Shall we then cease to praise,
In our peace-gilded days,

Our sires who have toil'd this proud nation to raise?
No! No! Let us swear while our standard shall wave,
That we never can cease to remember the brave.

Our country is plac'd on a pinnacle'd height,
Round its base then let tyranny roll in rude passion,

Firm as Atlas it stands in its panoply'd right,
Udismay'd and unmov'd while its wild waves shall
dash on.

On each pine cover'd hill
Freedom's temple is still,

And Adams and Jackson her service fulfill;
And long may the standard of liberty wave,

O'er the land of the free, and the home of the brave.

Miscellaneous.

THE FROLIC SOME DUKE.

The late Duke of Montague was remarkable for achievements of wit and humor, which he conducted with a dexterity and address peculiar to himself. In one of his rambles he observed that a middle-aged man, in something like a military dress, of which the lace was much tarnished and the cloth worn thread-bare, appeared at a certain hour in the Park, walking to and fro in the mall with a kind of mournful solemnity, or ruminating by himself on one of the benches, without taking any more notice of the gay crowd that was moving about him, than of so many emmets on an ant-hill, or atoms dancing in the sun.

This man, the Duke singled out as a fit object for a frolic. He began, therefore, by making some enquiry concerning him, and soon learned that he was an unfortunate, poor creature, who, having laid out his whole stock of money in the purchase of a commission, had behaved

with great bravery in the war, in hopes of preferment; but upon the conclusion of peace had been reduced to starve upon half-pay. This the Duke thought a favourable circumstance for his purpose; but he learned upon further enquiry, that the captain, having a wife and several children, had been reduced to the necessity of sending them down to Yorkshire, whither he constantly remitted them one moiety of his half pay, which would not subsist them nearer the metropolis, and reserved the other moiety to keep himself upon the spot, where alone he could look for an opportunity of obtaining a more advantageous situation. These particulars afforded new scope for the Duke's genius, and he immediately began his operations.

After some time, when every thing had been prepared, he watched an opportunity, as the captain was sitting alone, buried in his speculations, on a bench, to send his gentleman to him with his compliments, and an invitation to dinner the next day. The Duke having placed himself at a considerable distance, saw his messenger approach without being perceived, and begin to speak without being heard; he saw his intended guest start at length from his reverie, like a man frightened out of a dream, and gaze with a foolish look of wonder and perplexity at the person who accosted him, without seeming to comprehend what he said, or believe his senses, when it was repeated to him till he did. In short, he saw with infinite satisfaction all that could be expected in the looks, behaviour, and attitude of a man, addressed in so abrupt and unaccountable a manner; and as the sport depended upon the man's sensibility, he discovered so much of that quality in striking the first stroke, that he promised himself success beyond his former hopes. He was told, however, that the captain returned thanks for the honour intended him, and would wait on his Grace at the time appointed.

When he came the Duke received him with particular marks of civility, and taking him aside with an air of great secrecy and importance, told him that he had desired the favor of his company to dine, chiefly on account of a lady, who had long had a particular regard for him, and had expressed a great desire to be in his company, which her situation made it impossible for her to accomplish without the assistance of a friend; that having learned these particulars by accident, he had taken the liberty of bringing them together; and added that he thought such an act of civility, whatever might be the opinion of the world, could be no imputation upon his honor. During this discourse the Duke enjoyed the profound astonishment and various changes of confusion that appeared in the captain's face, who, after he had a little recovered himself, began a speech with great solemnity, in which the Duke perceived he was labouring to insinuate, in the best manner, that he doubted whether he was not imposed upon, and whether he ought not to resent it; and therefore to put an end to his difficulties at once, the Duke laid his hand on his breast, and devoutly swore that he told him nothing which he did not believe, upon good evidence to be true.

When word was served, the captain brought that dinner was entered the dining room with great curiosity and wonder, but his wonder was unspeakably increased, when he saw

at the table his own wife and children. The Duke had begun his frolic by sending for them out of Yorkshire, and had as much if not more astonished the lady than he had her husband, to whom he took care that she should have no opportunity to send a letter.

It is much more easy to conceive than describe a meeting so sudden and extraordinary; it is sufficient to say that it afforded the highest entertainment to the Duke, who at length, with much difficulty, got his guests quietly seated at the table, and persuaded them to fall too, without thinking of yesterday or tomorrow. It happened that soon after dinner was over, word was brought to the Duke, that his lawyer attended about some business of his Grace's order. The Duke, willing to have a short truce with the various inquiries of the captain about his family, ordered the lawyer to be introduced, who, pulling out a deed that the Duke was to sign, was directed to read it, with an apology to the company for the interruption. The lawyer accordingly began to read, when, to complete the adventure, and the confusion and astonishment of the captain and his wife, the deed appeared to be a settlement, which the Duke had made upon them of a genteel sufficiency for life. Having gravely heard the instrument read, he signed and sealed it, and delivered it into the captain's hand, desiring him to accept of it without compliments, "for," said he, "I assure you it is the last thing I would have done, if I had thought I could have employed my money or my time mere to my satisfaction in any other way."

SAXONY SHEEP.

On THURSDAY, 15th of July next, at 3 o'clock, P. M. at the Punch Bowl Tavern, near Boston,

WILL be sold at Auction, an entire flock of SAXONY SHEEP, consisting of 6 Rams, 25 Ewes and 4 Lambs, just arrived per Velocity from Bremen.

These sheep were selected with great care, by a person fully qualified for the purpose, from among eight or ten thousand of the finest sheep in Saxony, and are presumed to be decidedly superior to any sheep which have heretofore been imported. The comparative value of Saxony Wool above the Spanish is well known; the small quantities which have reached this country, have been eagerly bought up by the manufacturers of fine cloths, but the duty imposed by the new tariff, will soon prevent further importations.

Purchasers are assured that none of the sheep will be disposed of on any terms, before the above date; they may be examined any time previous to the day of sale at Mr. Perry's, about a quarter of mile from the Punch Bowl Tavern in Brookline, on the road leading to Cambridge.

Catalogues will be immediately prepared and ready for delivery. Conditions liberal and made known at the sale.

COOLIDGE, POOR & HEAD, Auctioneers.

June 19.

PATENT STEEL SPRING HAY FORKS.

JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Manure FORKS. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warrant of steel back do, Eisebe's cast steel polished Shovels—together with a great variety of other agricultural implements. June 12.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within thirty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

Correspondence.

NOTES ON THE SEASON.—MAINE.

To the Editor of the New England Farmer,

SIR,—In compliance with the request of Mr. Weston, of Stockport, Pa. published in the 47th No. of the second volume of the New England Farmer that "the subscribers in different parts would generally communicate their observations on the seasons," &c. and in conformity to his wish to know whether the frost (an account of which he communicated as occurring on the 6th day of May ult. at his residence N. L. 1 deg. 50 min.) was generally so severe as was here experienced, I make the following observations. The writer resides in the state of Maine, not far from 44 deg. N. L. and experienced no injury from the above said frost. As respects the frost mentioned by "A Roxbury Farmer," which killed corn, asparagus, potatoes, &c. it had no such effect at the last mentioned place. Perhaps many lower situations in the state of Maine may have felt its influence. It is known that water and other substances are capable of containing the element of fire or heat in two very different states. In the one heat or caloric eludes all the methods by which we are accustomed to observe it, either the sensation of feeling, or by the thermometer; in the other it manifests itself, obviously to our senses either by the touch, the thermometer, or the emission of light.* In the first of these states we are apt to call the body cold, and to say that this coldness is occasioned by the absence of heat. Perhaps this is improper; for even those bodies, which appear the coldest to the touch contain much heat. Thus vapour, which is colder to the touch than the water from which it was raised contains great quantities of heat; some say more than sufficient to heat a red hot. The like may be said of common salt and snow, or ice. If a quantity

NOTES BY THE EDITOR. The following passage in Parkes' "Chemical Essays," vol. i, page 64, gives a clear and concise explanation of the subject.—"It was formerly presumed that caloric [or what in common language is called heat] in whatever state it may be could always be measured by the thermometer. But the important experiments of Dr. Black and others have shown, that besides the caloric, which acts upon, and is appreciable by the thermometer, there are other qualities which are in such close union with most bodies, as to occasion no sensible variation in their temperature. That is caloric may be so combined with a body, as to have lost all power of affecting the most delicate instrument; yet when this latent heat is set at liberty, and converted to free caloric, as it is called, this will be as active, and as energetic as though it had never been confined. A single example will be sufficient to adduce, by the repetition of which any one may satisfy himself of the truth and propriety of this distinction.

Put about half an ounce of cold water into a small phial, and add to it very gradually, about an equal quantity of oil of vitriol, gently, shaking the phial after every addition of the acid. The consequence of this will be that the water will immediately begin to give out its latent caloric; and when so much oil of vitriol is added as is equal to double the measure of the water, the mixture will assume a degree of heat superior to that of boiling water."

of each of these substances be separately reduced to the degree of 23 to 30 Fahrenheit's thermometer, on mixing them together, the heat which would have raised the thermometer to the degree above mentioned now enters into them in such a manner that the mercury falls down to 0. Here an excessive degree of cold is produced, and yet we are assured that the substances contain the very same quantity of heat they did before: nay, although they seem to contain a vast degree of cold, they, in fact, contain much more heat than they did originally; for they absorb it from all bodies around them; and if a small bottle of water be put in the middle of such a mixture, it will, in a short time be full of ice.

Thus if heat flows from our body, or any part into any substance actually in contact with it, the sensation of cold is excited, and we call that substance cold; but if it flows from any substance into our body the sensation of heat is excited, and we call that body hot, without regard to the absolute quantity in either case.

Of all known substances the atmosphere either absorbs or throws out heat with the most remarkable facility;* and in one or other of these states it is always in respect to the surface of the earth, and such bodies as are placed on or near it. Of course when the atmosphere has been for a long time absorbing heat from terrestrial bodies, there must of course be a frost. And this may be provincial and local, consequently the frost will be the same. The air being ready to absorb heat from every thing that comes in contact with it, does of course absorb heat from the vapour it contains. The vapour is capable of being much colder than water before it is frozen yet by continual emission it loses its sensible heat and becomes ice.

In the polar regions, where we might suppose the frost would increase beyond measure, there are natural means to prevent it, viz. the vapour from more temperate regions, mixing with that of the polar regions; for it is well known that aqueous vapour always flies from a cold to a warm place.

Probably this may be the cause of frosts being more severe, and doing more damage in Massachusetts and farther southward, as they frequently do, than in the state of Maine. It is thought by many persons who are unacquainted

* Our correspondent is not altogether correct on this point. Air is a bad conductor of heat, or in other words it "absorbs or throws out heat" slowly. It is a very fortunate circumstance that air is a slow conductor of heat, as it tends to preserve the heat of the body in cold weather, softens the inclemencies of the seasons, and renders almost all climates habitable to man. The passage of caloric through bodies that are good conductors is much more rapid than through those that are bad conductors, and the former both give and receive it more quickly, and therefore, in a given time more abundantly than bad conductors, which makes them feel either better or colder, though they may be in fact of the same temperature."—*Conversations on Chemistry.*

Water, though said by Count Rumford not to be a conductor of heat in the same manner as solid bodies, yet gives and receives caloric with more facility than air. Were it otherwise you might cool a hot iron as quick in cold air as in water of the same temperature,

with the latter place, that there can be no fruit raised there; but it is well known that the fruit is not so frequently cut off by the frost in Maine as in Massachusetts—perhaps one cause may be that it is not so forward.

From what has been said we may learn the cause of frost's being so much harder in one place than in another, viz. The atmosphere absorbs a greater degree of heat from the surface of the earth and substances thereon; or there may be a greater quantity of vapour and moisture in and on vegetables.* Admitting the above to be the proximate cause, some think that powerful agent, electricity, to be the remote cause, by operating on the air and vegetation. M. Buffon, by his various observations proved that the lateral branches of trees were much more subject to the injury of spring frosts than the others. This rather favours the idea of electricity, as all substances standing erect and perpendicular attract the electric fluid, and electricity is the most powerful agent known in the physical world. A SUBSCRIBER.

* Many other causes may operate to produce this effect. Nothing can be more erroneous than an opinion, which would seem plausible on a superficial view of the subject, that difference of climate is caused solely by distance from the equator, or the relative situation of different countries as respects the apparent path of the sun through the heavens. The temperature of any climate, although it should seem to depend in a great degree on latitude, or distance from the equator, and the consequent more vertical, or more oblique incidence of the rays of the sun, is nevertheless very materially affected by a variety of collateral circumstances, such as the situation, whether high or low, moist or dry, the vicinity of mountains, forests, &c. "In the spring months (says a writer in Rees' Cyclopaedia, Art. Climate) the damp or low grounds are sometimes congealed by cold, where there is no such appearance on the hills, and therefore some of the young shoots of the more tender shrubs and plants are destroyed, when no injury happens to those in the latter situation." This, we believe, is generally the case, unless the low grounds are protected by fogs, or mists. The cause of this effect we believe may be found in the greater density of the air on low than on high ground, and the more dense the atmosphere, the faster it imbibes or attracts the caloric from the earth. The soil of Maine likewise, having been less cultivated probably contains more carbonaceous or coaly matter, (which is a slow conductor of heat,) than that of Massachusetts. The mould which is formed by the decomposition of animal or vegetable matter covers the earth as it were with a carpet, and prevents the escape of its caloric. Sir Humphry Davy says, "I have ascertained by experiment that the darkest coloured dry soil (that which contains abundance of animal and vegetable matter; substances which most facilitate the diminution of temperature,) when heated to the same degree, provided it be within the common limits of the effect of solar heat, will cool more slowly than a wet pale soil, entirely composed of earthy matter."

Besides the sun in the spring and summer seasons, is longer above the horizon in high than in low latitudes. Our correspondent on the 26th of May in 44° N. lat. enjoyed nearly half an hour more of sun-shine than Mr. Preston, in 41° 50'. It is owing to the almost constant sun-shine which takes place after vegetation commences, that its progress is more rapid in Siberia than in Italy. From the same cause the days in midsummer are often hotter as well as longer in Bergen than in Rome, in Quebec than in New Orleans. The seasons are more uniform (though the extremes of heat and cold are greater) in high latitudes than in those which comprise what is called the temperate zone.

VERMONT.

To the Editor of the New England Farmer,

SIR,—In reply to yours of the 27th ult. pursuant to the wishes of Mr. Preston and others as communicated in the New England Farmer of the 19th ult. headed "The Season," I would observe that the late frosts in Vermont, especially that of May 26th, were somewhat alarming. Vegetables, as corn, beans, vines, &c. that were up, appeared to be principally destroyed, and in some few instances a second planting was resorted to; but in most cases the plants recovered. The leaves of the beech, oak, and some other trees were killed, and in some instances, it seemed for about twenty days, that new leaves would never come; but since which time, the new leaf has slowly made its appearance. Fruit trees were not sufficiently forward here to sustain injury. The month of May being in general cold and dry; though April was remarkably warm.

On the 15th June, I started on a tour to Saratoga and Ballstown, N. Y. The weather was so cold as to make it uncomfortable travelling. The whole distance, (70 miles) vegetation wore a gloomy appearance. The crops of grass extremely thin and light, the corn yellow and backward. The winter grain, as well as grass, having been much winter killed by the frequent thaws, and the enormous and unparalleled depth of ice that in February last apparently covered the whole face of creation; and which was succeeded by the most sudden and destructive freshet, ever known in these parts; these considerations, added to the "general depression" seemed to fill the mind of the farmer with fearful apprehensions. But on my return home, after fifteen days, the copious rains and a few very warm days of from 80 to 94 degrees, had altered the vegetable kingdom astonishingly. Corn had assumed an entire different colour and grown rapidly; wheat crops are more promising than for several years past; grass in general is good, and notwithstanding the frosts and cold weather; the fruit trees present a goodly appearance; and on the whole I do consider that in Vermont and parts adjoining, the husbandman has a fair prospect of a bountiful reward for his labour.

Very respectfully, yours, &c.

JABEZ PROCTOR.

Proctorsville, Vt. July 6, 1824.

To the Editor of the New England Farmer,

SIR,—In compliance with the request of Mr. Preston, in your paper, No. 47. I would make the following general remarks.—The winter in this region was uncommonly mild—but little snow—the winter crops much injured by the frost—grass was killed on flat land. The spring has generally been cold and wet; on the morning of the 26th of May, the ground was frozen so as to bear a person; and ice was in some places near a quarter of an inch thick; the beech leaves were killed in many places; the cold continued till the middle of June; there was a slight frost on the mornings of the 11th, 12th, 13th, and 14th, and on the last day there were flakes of snow blown along by the wind. Since that time the weather has been warm, with seasonable showers, and now crops of all kinds look very promising. The cold weather retarded the growth of Indian corn—it is back-

ward, but it is now growing luxuriantly, and if the season continues favourable will produce a good crop. The crops of wheat, oats, barley and potatoes never looked better. The gardens are rather late but the crops good, and have been the least injured by insects that I ever knew.—At present the prospects of the farmer are very flattering.

My residence is about two miles west of Connecticut River, in 44 deg. 11 min. N latitude.

J. W.

Ryegate, Vt. July 6, 1824.

DESTRUCTIVE INSECTS.

To the Editor of the New England Farmer,

SIR,—I herewith send you in boxes some insects, which, where I live do considerable mischief. The Rose Bugs, so called here, devour almost any thing on which they happen to alight. This season, I have known them to take young English cherry trees, and devour every leaf. They have injured apples considerably, and on some trees almost destroyed them. They make their appearance about the time that roses blossom, and when roses are gone, they are almost instantly. Their size appears to be always about the same.—Now some knowledge from whence they come, and whither they go is desirable, and how they propagate their species.

Those lice, as I call them, I find upon young shoots and grafts of apple trees, always accompanied with psismires, which sometimes destroy the tender part. But the time in which they make their first appearance, or when they go away, I cannot tell.

If you think this worth your notice, some information, through your valuable paper, would be very agreeable; if not cast it into the fire.

Yours with esteem,
BEN OSGOOD.

Methuen, July 6, 1824.

BY THE EDITOR. We cheerfully communicate the little information we have been able to obtain relative to the insects above referred to. We know nothing of the natural history of the Rose Bug, and repeated inquiries have resulted in nothing definite or satisfactory relative to "whence they came or whither they go." We only learn that they are very voracious, and not very nice in their selection of articles for food. They not only devour the leaves of apple trees, but have, in some instances, nearly devoured the young apples.—Soap suds, lime water, tobacco juice, elder juice, and other acid or pungent substances, have little or no effect on them. The only operation which seems to disturb them is that of breaking their bones, *vi et armis*, or grinding them to powder by main force. But they sometimes appear in such multitudes that it is impossible to make war upon them with any hopes of success.

The other insects are of the genus *Aphis*, and they are generally known by the name of *Plant Lice*. They are the same which cause what is called honey dew, and the psismires, which accompanied them were, probably, attracted by that sweet substance. We have already (page 262 of the present volume, under the head *Horticulture*) given some account of these animalcules. Soap suds, forcibly applied, is said to be the best remedy against them.

Experiments in perpetuating Crops of Hay.—A meadow, which had become sward-bound, so as

to produce only about three fourths of a ton to an acre, was mowed on the 10th of July. On the 20th of the same month it was ploughed and sown with buck wheat, and clover and herd's grass seeds. A fair crop of buck wheat was taken from the land in the autumn, and the meadow, this year, will give double the crop of hay it did the last year.—Communicated.

Pawtuxet, R. I. July 13, 1824.

Massachusetts Agricultural Society.

FOR THE NEW ENGLAND FARMER.

At a meeting of the Trustees of the Massachusetts Agricultural Society held July 10, 1824. The Trustees having received by the ship Bowditch, Capt. Caleb Curtis, one full bred Herefordshire Bull, of one year old, and a full blooded Heifer of the same breed, raised by Sir I. G. Cott-rell, Baronet, and purchased by Admiral Sir Isaac Coffin, and by him presented to this Society—and also a four year old full blooded leifer of the Short horned breed, raised by the celebrated improver of that breed, John Wetherell, Esq. also purchased by Sir Isaac Coffin, and presented by him to this Society for the amelioration of the breed of cattle of his native State. It was voted,

"That the thanks of the Trustees of this Society heretofore presented to Sir ISAAC COFFIN, M. P., and transmitted to him on his announcing his intention to present these fine animals, be published in one or more of the papers published in Boston, particularly the New England Farmer."

We congratulate the friends of Agriculture upon this accession to our valuable breeds. We now possess samples of the most improved stock of cattle in Great Britain, and having both the parents, we can preserve them pure. To this end the Trustees have placed the Bull Admiral with the Heifer of the same race, Annabella under the care of Ezekiel Bersey Derby, Esq. of Salem, for one year, where those disposed to possess themselves of this stock may apply.

The Bull and Heifer of the Herefordshire breed, remarkable for their qualities as beef cattle, as well as milkers, are placed with John Prince, Esq. of Roxbury, for one year. The property in these animals will be held by the Society, and they will be so managed, as to give every part of the State, by turns, the advantage of them.

We cannot omit to take notice of the great liberality of Sir Isaac Coffin, in thus repeatedly sending out, at great expense, the finest and most approved breeds in Great Britain, nor ought we to forget, on this occasion, the generous present, made by his brother, Gen. Coffin, of fine Stud Horse of great bone, and power.—Such acts of public spirit are of permanent, and lasting value, and do honour to these gentlemen.

The Trustees think it their duty to present their thanks to Capt. Curtis, for his great care of these animals. Their fine condition on their arrival is the best proof of his attention to them. They appeared as if they had been just taken from a fine pasture.

The pedigrees of these animals, are as follows:—Those conversant with the improve breeds, will perceive, that there is no better blood to be procured in England.

The Short Horned heifer, Annabella, red and white, calved in 1820—got by Major—dam Ada by Denton—grand dam Aurora by Comet—great grand dam by Henry—great great grand dam by Danby—in calf by Rockingham.

Herefordshire bull SIR ISAAC—got by Waxey—Waxey by Mr. Yarwoth's Trojan, which he offered to shew against any bull in England for 100 guineas—Trojan's dam was Margaret bot by Mr. Yarwoth of Mr. Tomkins of his thorough bred choice stock—Waxey's dam was Brunette out of Margaret—Sir Isaac's dam was Young Charmer, own sister to the Brown Ox, that won the premium last Christmas at Bath, and afterwards was exhibited at Bristol as a Show and considered the fattest ox in the kingdom. Young Charmer and the Brown Ox were got by a favourite bull, bred by the late Mr. Benjamin Tomkins. Young Charmer is out of Old Charmer killed at Hereford at the Christmas Show of fat beef and was much superior to any exhibited.

The Herefordshire Heifer is also from Waxey out of Stately—Stately out of Tidy—daughter of Mad Cap which was considered the best cow in England, and the greatest weight, and the least bone, weighing eighteen score and a quarter.

Extract from the Supplement to the British Encyclopedia relative to these two breeds:—

"The Short Horned, sometimes called the Dutch, is known by a variety of names from the Districts where they form the principal stock, or where much attention has been paid to their improvement. Different families of his race are thus distinguished by the names of the Holderness, the Teeswater, the Yorkshire, the Durham, Northumberland and other breeds. The Teeswater breed, a variety of the Short Horns, established on the banks of the Tees at the head of the vale of York, is at present in the highest estimation, and is alleged to be the true Yorkshire Short Horned breed. Bulls and cows from this stock, purchased at most extraordinary prices, are spread over the north of England, and the border counties of Scotland. The bone, head, and necks of these cattle are fine—the hide is very thin—the chine full—the loin broad, and the carcass throughout large and well fashioned, and the flesh and fatting quality equal or perhaps superior to those of any other large breed. The Short Horns give a greater quantity of milk than any other cattle—a cow usually yielding 24 quarts per day and three firkins of butter in a season. Their beef is used for the East India ships, being thicker it retains its juices better in long voyages."

The Herefordshire cattle are of a deep red colour, with fine hair, and very thin hides—neck and head clean—horns neither long nor short—bone not large. The Hereford cattle are next in size to the Yorkshire Short Horns. Both this and the Gloucester variety, are highly eligible as dairy stock and are found to fatten very easily. Sir I. G. Cotterel gave for the mother of the bull sent out \$200 and the heifer is now with calf by a bull which was sold for 2000 dollars. The Herefordshire stock carried all the prizes last year even against the Short

SILVER CUP.

Honour to whom honour is due.—A SILVER CUP of much value, and of very elegant workmanship, has been recently presented to Mr. John Young, author of "Letters of Agricola," by his friends in Nova Scotia. This splendid donation appears to have been intended to indicate the high sense which the donors entertain of the exertions of Mr. Young to resuscitate and redeem the Agriculture of the Province from a low and apparently hopeless state into which it had fallen, before the writings and exertions of that gentleman, awakened the energies of the inhabitants and kindled the zeal for agricultural improvement, which has given a new face to the country; and may be almost literally said to have caused the "wilderness to blossom as the rose." The following account of the proceedings on that occasion we have extracted and abridged from the Acadian Recorder, a Halifax paper, of June 12.

A meeting of Mr. Young's friends, called for the purpose of presenting him with this cup, assembled on Monday last in the Exchange Coffee House at 12 o'clock. The large room was prepared for the accommodation of the subscribers and for the display of this very elegant piece of plate. At the upper end was stationed a square table covered to the floor, with moreen; upon which stood another of inferior size, bearing on it the cup—thus made visible to all present.

It is a tripod, fashioned in the form of a Scotch thistle and is about 14 inches high. The feet are composed of three distinct leaves issuing from the stem, and bent upwards towards the extremity so as to resemble those of the natural plant. The silver here is artfully wrought, not to have a polished shining appearance, but to represent the silky softness which is the effect of the fine down that nature sprinkled on the surface. The edges of the leaves are slightly tinged with gold and in a different style of work, of which nothing but technical terms could convey any proper idea. The stem is made in imitation of the stalk, and the cup itself of the flowers of the thistle.—Both the calix and the corolla are hollow, so that the cavity or inside is more capacious than would seem at the first look and holds about 3 pints. On this part the artist has exhausted all his skill, and for beauty and taste it stands unrivalled in this province. Connected with two garlands of flowers, very richly embossed, a fancy cord apparently of virgin gold winds round the body of the cup in festoons, and in it are fastened two rings of some precious metal, which serve equally for decoration and for use. Below one of these festoons is the inscription, and on the obverse side is an emblematical shield of heraldry containing the arms of Nova Scotia. To the stem are attached eight stalks of wheat—four on each side—with the ears hanging in a pennisle form, as of the ripened grain. These are of a bright yellow and so happily executed as to appear natural. The whole tripod is sustained on three small globes, and the interior of the cup is washed with gold. This tasteful piece of workmanship was designed by Mr. Torbett of this town, and fabricated by Messrs. Rundell, Bridge & Rundell, of London, jewellers and silver smiths to his Majesty, and is a noble and highly finished tribute to the arts. The inscription is as follows:

Presented
BY THE FREEHOLDERS
AND OTHER INHABITANTS
OF THE TOWN OF HALIFAX,
TO JOHN YOUNG, ESQ.

IN TESTIMONY

Of the High Esteem and Respect they entertain for his exertions in the advancement of the Agriculture and general interests of the Province,

AND IN APPROBATION OF
HIS DIGNIFIED CONDUCT.
AT THE LATE ELECTION.

NOVA SCOTIA,
1823.

The account given of the ceremonies and addresses, which took place at the presentation of the cup, we have not room to publish at large; but the following extracts will shew that they were decorous and appropriate.

John Starr, Esq. first addressed himself to the Chairman, and then turning to Mr. Young with the cup in his hand said, that a very pleasing duty had been assigned to him by the committee. They had prepared this cup which on behalf of the subscribers he had now the honor of presenting, as a mark of their respect and as expressing their sense of the important services which Mr. Young had rendered to the province. He performed this duty with great and sincere pleasure, and hoped that Mr. Young would long live to possess and enjoy so elegant a gift—and might never use it without emotions of gratitude to the Divine source from whence all good proceeds.—Then, directing himself to the Chairman, he observed, that the inscription on the cup, sufficiently indicated the views and feelings with which it was presented, in allusion to the exertions of Mr. Young in promoting the agricultural and general interests of Nova Scotia—and to his gentlemanly and dignified conduct at the late Election. The presence of that gentleman prevented him from giving full utterance to the opinion which he had formed from personal observation during a recent excursion of 300 miles into the interior, and from the reports of others, of the actual good which had resulted from his labours and from the new spirit awakened, and now in active operation throughout this province. As a native, he felt proud to declare to the assembly so respectable and so deeply interested in the advancement of the country—that a rapid and very great improvement had taken place and was still going on in all the branches of agriculture. It was making itself visible in the face of the country—the tools of the farmer had been dignified, and made the theme of conversation—and the establishment of oatmills was productive of incalculable advantage. Of so happy and so beneficial a change, he was certain that the gentleman now before him did not arrogate to himself all the praise. He was not the sole cause, but as Agricola he was the moving cause. Much must be attributed to the noble Earl who warmly patronized the new system, to our excellent Governor, Sir James Kempt, who had ever taken a lively interest in its success, to the worthy Vice President of the General Board, (now the Administrator to the

By order of the President,
BENJ. GUILD, Assist. Rec. Sec'y.

Government,) to the Judges, and other leading characters—all of whom vied with each other in assisting and supporting it. The peculiar circumstances of the times combined with other causes; and from their united operation and the rate of improvement at which we were now advancing, he was satisfied that the day was not far distant when our independence in bread corn would be accomplished.

He concluded by declaring that he yet hoped to see Mr. Young occupy a seat in the Legislature—when he had no doubt he would manifest an equal anxiety in behalf of the commerce and fisheries of the province, which had distinguished him in promoting its agriculture.

Mr. Starr finished his address amidst loud applause:—when Mr. Young followed, and began under the oppression of much feeling. He represented the cup as the first of the kind ever bestowed in this province from political views; and he was gratified that his conduct had appeared to the subscribers in so favorable a light, as to be honored with this splendid mark of their respect. Such a present, under such circumstances, was new in the history of mankind. Other bodies of men had conferred rewards on the successful—they on the unsuccessful. Receiving, therefore, so valuable a testimony of their esteem he considered himself as bound to explain the causes which had led him to offer for the county of Sidney:—when so many of his adherents expected that he would have reserved himself for the first vacancy in Halifax. He said that the loss of his election for this township in September last, was scarcely known to Sidney, before he received application from three leading characters; and that two posts had not gone by when he received other and new letters from different quarters, requesting him to propose himself for that district of the province, in consequence of which he had finally agreed, as far back as November last, to come forward. The generosity of these various applications must, therefore, under his peculiar circumstances attach him to the freeholders of that county, and he would consider it his primary duty to serve them—although at the same time he trusted that he would never be forgetful of the many obligations he owed to his friends who now formed this very full and respectable meeting. He then took occasion to animadvert on the conduct of his opponents at the late election, and censured, with much severity, the unfair and violent practices to which they had recourse. At the same time he cautioned his friends against entertaining any sentiments of political hostility, and exhorted them to unite in promoting the best interests of the province. Men may differ in their views as to the representative they would prefer; but they should never carry their rancour so far as to try to defeat any public measure, merely to wreak their resentment on the opposite party. There was a code of political morality as well as a system of moral rectitude, and the rules of each were given for the regulation of our public and of our private conduct.

He concluded by observing, that the presentation of this cup from so large a portion of his fellow citizens, not composed, as was falsely represented, of foreigners against natives, nor of Scotch against Irish, would weigh with him at all times to seek their general, no less than

their agricultural prosperity. He had the honor of ranking among his friends not merely Scotchmen, but the English, the Irish, the French, Germans, and the Dutch, along with the natives of the Province. The list of subscribers to the cup comprehended all classes, and in it would be found men of all the people who had settled in Nova Scotia. His supporters, therefore, were no national faction; but had been drawn together by the wrongs they had suffered. He requested them to bury past offences, to oppose systematically any cabal, which might be formed for the purpose of controlling and unduly influencing their votes; because in the free and unbiassed choice of the people lay the best security for the faithful discharge of the legislative duties. He then closed a speech of about forty minutes by taking the cup in his hand, and pronouncing with some emotion, that he accepted it with the highest pleasure, and would esteem it the fullest reward and the proudest ornament of his public life.

BALTIMORE VACCINE CATECHISM.

BY DR. JAMES SMITH.

Question. What is the vaccine matter?

Answer. The genuine vaccine matter may properly be said to be the true seed of the variola vaccina, or kine pock. When taken out of the pock on the eighth day of its growth, it is found in the state of a perfectly clear and transparent fluid. But when taken from the crust or mature pock (in which it is lodged in numerous small cells) it is slightly opaque; and if examined in this state with a good microscope, the perfect seed of the vaccina may be as plainly discerned, as the grains of any small seed can be seen, by naked eye.

Q. How are these seeds put up or furnished to those who want them?

A. The vaccine matter is put up sometimes in the crust or scab, enveloped in a little fine wool or cotton, or set in wax; and sometimes it is put up on small plates of glass, to which it adheres, when applied in a fluid state.

When the vaccine matter is properly put up in any of these ways, it can be sent in a letter to any place; even to the remotest corners of the world.

Q. How is the vaccine matter to be used?

A. When used, a very small quantity of it is to be conveyed on the point of a needle or lancet, and inserted into a small puncture or incision made in the arm to receive it; midway between the shoulder and elbow.

Q. How is it known when the operation succeeds?

A. At the end of the third day after the planting of the seed, a small pimple, or "rising in the skin," will be observable. This pimple, if the operation succeeds, will increase daily in size, until the eighth or ninth day, when it is usual to find a beautiful pock, the perfect vaccina growing on the arm, as large as the half of a common garden pea.

Q. Is it necessary to use medicines of any kind in vaccination, or what particular attention is necessary to be paid to the vaccine process just described?

A. It may be truly said, that in vaccination, medicines of all kinds are not only useless, but they are injurious; and none are wanted. A

state of good health in the patient is essential; and no other preparation is required.

The vaccina should not be allowed to be broken or injured in any way; but it should be "let alone" until it comes to maturity; when it will invariably, terminate in a clean, smooth, regularly formed scab or perfectly organized crust, which is the true kine pock itself.

The vaccine crusts most commonly fall off between the fifteenth and twentieth days after the insertion of the matter; but it is more proper they should be taken off as soon as they become loose, or when the roots, by which they adhere to the arm, decay.

Q. Of what value is the kine pock to those who use it?

A. Vaccination is sometimes resorted to for the cure of various diseases, such as scrofula, cancer, certain cutaneous affections, whooping cough, &c. But the particular use for which this remedy has been given to mankind, is to prevent their being injured by the small pox. And there is no doubt of the fact that any person who has been once properly vaccinated, is rendered for ever thereafter perfectly secure from this loathsome disease.

Q. But many persons who have been vaccinated, and declared by their physicians to be secure from the small pox, have nevertheless been known to take it; and some have lost their lives by this plague, when they considered themselves entirely exempt from all danger. Are not these facts subversive of the declaration just made?

A. No. It may be confessed that many unexpected difficulties have arisen, in the use that has been made of the kine pock, and these difficulties have been often followed by the most fatal consequences; but there is no natural defect in the true kine pock. It has power to save all, who use it as they should, from the small pox.

Q. To what causes chiefly are the difficulties that have occurred in vaccination attributable?

A. We may refer the mistakes that are generally made in vaccination, to one or other of the following accidental causes. 1st, While the kine pock is growing on the arm of a proper subject for it, it is often scratched, rubbed, and bruised, and sometimes physicians themselves destroy it, by taking matter from it; leaving the person concerned liable, in consequence of the indiscretion, to suffer, whenever they may be exposed to the small pox. 2nd, Persons who are not in that good state of health they should enjoy, to have the kine pock in perfection, are often vaccinated unseasonably. 3rd, But the most common cause, of failure in vaccination, and consequent disappointment, arises from the use that is frequently made of spurious matter or imperfect seed, by practitioners who do not know how to select it.

No certain evidence, notwithstanding, has been ever yet given to the world, that any individual once properly vaccinated has been ever thereafter injured by his exposure to the natural small pox.

Q. Mankind should indeed be thankful for so great a blessing. But how can those who are concerned, know with certainty whether their vaccination has been perfect or imperfect, genuine or spurious?

A. There is no criterion of vaccination, or method of judging of this process, so certain, perhaps, as that which is founded upon the or-

ganization of the vaccine crusts themselves. If the scab produced in any case, or the vaccine itself is found to be perfect, the operation in such case may always be declared to have been perfect also; and the patient may be pronounced without any other evidence, or inquiry concerning his case, to be secure from the small pox during life; while, on the other hand, if the scab is found to be wholly or in part only imperfect, so also may the patient concerned be declared to be imperfectly vaccinated, and informed accordingly of his continued liability to suffer, if exposed either to the variolous or varioloid contagion.

Q. If such important information as this can be derived from the vaccine scabs, should not those who are vaccinated take care to save them?

A. Certainly; and they should always submit them as soon as practicable, to the examination of some vaccinator, whose knowledge of their proper organization would enable him either by his eye, or by the use of good glasses, to detect any irregularity or imperfection that may be discovered in them.

Q. It would seem as if this method of practice, dispensing with all the labor of a personal attendance upon the patients concerned, would afford great facility in the proper use of the vaccine. Have any defects been discovered in this method of conducting vaccination?

A. The laws of nature are in no case more uniform and unchangeable, than they have been observed to be, in regard to the production and formation of the vaccine crusts. But they are often lost through the carelessness of the persons upon whom they are produced; and there are but few practitioners, who yet know how to examine them, or who have yet acquired that perfect knowledge of their nature and organization, that is essentially necessary, to enable them to give a correct opinion on any case of vaccination, that may be submitted to them in this way.

Q. What other tests of perfect vaccination have we to depend on?

A. Several have been proposed. Dr. Jenner's chief dependence was upon the peculiarity of the symptoms usually attendant on the vaccine, and the regularity with which they succeeded each other. The evidence to be obtained of the perfection of the vaccine process by this method, is sufficiently satisfactory; but the constant attendance of an experienced vaccinator, for at least two weeks, is required, to enable him to assure the patient in this way, of his safety from the small pox.

An ingenious test of vaccination has been lately offered to the world, by Dr. Bryce of Edinburgh, a vaccinator who has stronger claims upon our implicit confidence in his skill in this business, than any other person living perhaps. Dr. B. states, and he states the truth, that if any person who is vaccinated in one arm, will take the matter from the pox as soon as it can be obtained, and insert it in the other arm, both affections will terminate simultaneously. But this new test, however useful it may be in particular cases, (as a leading string to the blind,) will, it is feared, be productive in the end of much mischief, by deteriorating the vaccine matter itself; and thus involve the ignorant in still greater difficulties than they experience at this present time.

Some learned doctors deny that any positive opinion can be given on any case of vaccination; and they assert, "that if there has been discovered any criterion by which we can pronounce a subject completely guaranteed against the invasion of the small pox by vaccination, it is to be found in that insensibility to the vaccine virus, which is the result of repeated vaccination, until not even a local vaccine inflammation can be excited." But this is a slander upon the vaccine; and it is hoped it will be soon abolished from the schools where it is taught and consigned forever to the regions of error, whence it originated.

Q. What was the opinion of the illustrious discoverer of the vaccine, in regard to the vaccine scab?

A. It cannot be discovered from his writings, that he placed any dependence on the appearance of the scab, as a test of the security of any person from the small pox. A vaccine scab was transmitted to him some years before his death, by the writer of these answers, and was acknowledged to have been used by him "with perfect success;" a fact that is sufficient of itself to establish the propriety of using the vaccine crusts, against which some pretenders in America to superior skill in vaccination, yet disingenuously exclaim.

Q. How, when, and where was the vaccine first discovered?

A. The fact was known in England "time immemorial," that those who took the vaccine pox casually, were not liable to take the small pox at any time thereafter during their lives.—But the first direct experiment in vaccination was made by Dr. Edward Jenner on the 14th of May, 1796, with matter taken from the hand of a dairy maid who was infected from milking her master's cows. Of the actual origin of the vaccine pox itself we know nothing more than we do of the origin of any other distinct natural production. Neither is it necessary for the general welfare of mankind that we should be informed precisely how, when, or where this remedy did first appear.

Q. What was Dr. Jenner's opinion of the origin of the vaccine pox?

A. He viewed the vaccine pox as an animal secretion, derived at first from the grease of the horse; and from their diseased heels, he supposed it was communicated by those who dressed them to the udders of the cows, and from the cows again to the persons who milked them. Jenner never suspected that the vaccine was really a completely organized production of its own kind, living in its own proper place, perfectly distinct, and properly fitted for the continuance of its own species.

Q. How long is it supposed the natural small pox has prevailed in the world?

A. The silence of the ancient Greek and Roman writers respecting the existence of the small pox, has induced physicians generally to consider this plague as one of late origin. But the minute description we have of leprosy in the 13th and 14th chapters of Leviticus is so properly applicable to the small pox, as a contagious disease, and the method ordered by Moses to prevent its spreading among the Israelites, is so replete with wisdom that those who will read these chapters attentively will find in them many good reasons for believing that the small pox prevailed among men from the earliest

ages of the world. The word Leprosy in the original Hebrew language is not the name of any particular disease, but a general term signifying any thing out of which evil may come, or from which injury may be derived.

Q. How is the natural Small Pox known?

A. The patients are generally seized with a chill, succeeded by fever, pain in the head, back, and limbs, sick stomach, &c. On the 3d day small spots or "risings in the skin" are perceptible, first on the face and afterwards on the body and limbs. On the 5th and 6th days the pimples contain a clear limpid fluid, that changes in two or three days more into a yellowish or purulent like matter. About the 12th day these eruptions begin to dry, and they soon afterwards terminate in dark colored scabs or crusts and fall off, leaving deep pits or scars for life. This is the mildest form in which the distinct small pox appears. When the disease is more severe the eruptions are more numerous or confluent; and the whole body sometimes becoming covered with them assumes the most loathsome and horrible appearance imaginable. In this form the natural small pox most generally proves fatal between the 9th and 14th days of the disease.

Q. Why will not any person take the small pox more than once, and why not subsequently as well as previous to vaccination?

A. This question has never been seriously attempted to be answered by any competent authority. Neither can it yet be satisfactorily solved by any person. Some who believed that the small pox matter was no other than a particular humor secreted from the persons of those who had it, have supposed that the individuals concerned were divested of it entirely by its being thrown out of their systems, and that having no more of this particular matter or humor left in their blood they could give out no more of it during the remainder of their lives. The absurdity of this supposition, however, requires no other refutation than to mention it. And the same may be said of every other hypothesis heretofore advanced on this subject.—It is probable, notwithstanding, that this question may yet be solved; and that it will be found there is actually something left or deposited in the system of every individual, affected either by the small pox or vaccine pox that remains with them during life; rendering inoperative the sporadic or gemma contagionis, on which the natural increase of these peculiar fungi depend.

Q. Have any imperfect or adulterated varieties of the variola been yet observed?

A. Undoubtedly several distinct varieties have been noticed. But that which claims our most particular attention at present, is that species of adulterated contagion or seed that has been produced by an admixture of the vaccine with the variolous matter, and from which a new plague has lately sprung up among us, now well known by the name of the varioloid disease.

Q. This is an extraordinary novelty in the history of diseases, and has of late excited great uneasiness. How can this new plague be prevented?

A. The vaccine pox and small pox are no other than two several species of the same natural genus of plants; and they adulterate each other when they are propagated in the same vicinity, upon a well known principle. It was wise-

ly ordered, "thou shalt not sow thy vineyard with divers seeds; lest the fruit of thy seed which thou hast sown, and the fruit of thy vineyard be defiled." If we would prevent the production of new varieties of the variola, this same order should be enforced now as it respects the propagation of the small pox among every people that encourage vaccination.

Mankind may rest assured that in the true kine pock, cultivated as it ought to be, we possess an effectual preventive against both the small pox and varioloid diseases. Let us take care then to preserve it in its purity and perfection; lest in our folly we may so abuse that we may lose it, and become exposed again to all the calamities that attend upon the general prevalence of the most destructive plague that has ever prevailed among men.

Q. Is there any reason to expect that a more perfect knowledge of the kine pock than is yet possessed, will throw any light upon the nature of any other disease than the small pox?

A. We may certainly look to the kine pock as the proper medium through which many of the long established errors in medical science, will be discovered and exposed. But new light may be more particularly expected to be derived from it, respecting the nature of the several remote causes that produce the dysentery, bilious and intermittent fevers, plague, yellow fever, measles, syphilis, hydrophobia, cancer, &c. The advice of every good physician to his pupils, ought to be—follow nature and study the true kine pock.

BALTIMORE VACCINE INSTITUTION.

To the Public.

The undersigned begs leave to inform the public, that he has been encouraged to make the arrangements necessary for this purpose, on his own individual responsibility, through the aid of his particular friends; and until some more satisfactory provision can be made, for supplying this remedy to those who want it, he will furnish the Vaccine Matter with proper directions for its use, free of any charges, to all those who may apply to him for it.

Congress at their next session, it is expected, will make provision for the general distribution of the Vaccine Matter, agreeably to the plan lately recommended to them. But if they should not pass any act to encourage vaccination, the undersigned will continue to furnish this remedy from this Institution, as at present, on his own responsibility. Those who wish to encourage these efforts, may then contribute their aid thereto in any way most agreeable to themselves.

The Vaccine Matter will not be sold in this Institution on any terms, and when the undersigned cannot give it to those who want it, he will notify the public, that he has been compelled through necessity to retire from an institution, that has been the particular object of his care and solicitude, for twenty-three years now past.

It will be expected from all who obtain Vaccine Matter from this Institution, whether physicians or private citizens, that they shall attend to the necessary directions that will be given with it, otherwise all correspondence with them must be dropped, and no orders from any such will be attended to thereafter.

There are no human laws competent to af-

ford any people protection from the small pox, the regular use of the kine pock, therefore, has become a positive duty, that every person in society owes to himself, and to all who depend on him. Every citizen is chargeable by the community in which he lives, with all the injurious consequences that may happen to others by his neglect of this duty.

The small pox may yet indeed be destined, as has been the case heretofore, to sweep off from the face of the earth, innumerable multitudes of human beings, that are sunk in ignorance, or who deceiving themselves, may yet consider vaccination as unworthy of their confidence. There is no occasion however to dispute with them or multiply words about this remedy. It is enough to say that the kine pock has been given to mankind for the best and most wise purposes. That it is another free gift of mercy from the same exhaustless source, whence we derive every good and perfect gift; and that it falls but little short of impiety on the part of any christian, to reject it.

All applications directed to this Institution, postage paid, will be carefully attended to by the undersigned.

JAMES SMITH,

Late Agent of Vaccination for the U. S.

Vaccine Institution, Baltimore, May 1, 1824.

NEW ENGLAND FARMER.

SATURDAY, JULY 17, 1824.

MILKING COWS WITH TUBES. We have received intelligence from various parts of the country of the injurious consequences attending the use of tubes in milking cows. It will be recollected that in the same paper in which we announced the supposed discovery, we published a note from Dr. Thacher, * containing a caution respecting the introduction of rough tubes and straws; and stating that "further experience by the careful use of smooth tubes must decide on the utility of the method." We are sorry to learn that a too hasty adoption of this mode of milking has occasioned loss of property, and much suffering to the unfortunate animals, which were the subjects of experiment. The Connecticut Mirror, under date of July 12, states that "a number of cows in Weathersfield have been seriously injured by the use of tubes in milking them.—Their bags swelled, the milk afterwards taken from them was not fit for use, and then they died up. We have heard, though it may be a mistake, that three cows in Windsor have lately died in consequence of this treatment; and if it is not so the statement shall be contradicted. If it is, it should be made known, that the use of this "Invention" may proceed no farther; and gentlemen in this vicinity, who keep large dairies, are requested, should such occurrences take place, to let some printer or other know of them. The loss of property is the concern of the owners, the saving of time to the boys or girls, who are set to milk, and their better disposal of it, are matters of which we cannot judge, but the cruelty to the animals is unwarrantable."

* See page 378, of the present volume.

ANOTHER REMEDY AGAINST LICE ON APPLE TREES.

An intelligent cultivator assures us that there is nothing more effectual against the insect which attaches itself to the bark of apple trees, like a barnacle, in shape and color like half a kernel of rye divided longitudinally, than a strong ley made by dissolving potash in water. This liquor, likewise, he assures

us, gives a beautiful green color to the bark, and greatly promotes the growth of the tree.

From the Salem Gazette.

NOTICE TO FARMERS.

At a late meeting of the Board of Trustees of the Essex Agricultural Society, the Committee for viewing the Farms for the management of which premiums are claimed, consisting of

TEMPLE CUTLER, Esq. of Hamilton,
Dr. BENJAMIN PARKER, of Bradford,
Mr. AARON PERLEY, of Boxford,
Col. DANIEL ADAMS, of Newbury,
Col. NATH'L FELTON, of Danvers, and
JOHN W. PROCTOR, Esq. of Danvers,

were instructed "to extend their examination to other farms in the county, where they think useful information may be obtained on the subject of agriculture, to make notes of such improvements as may come within their observation, and to report the same to the society at their next meeting," which will be on Tuesday the 19th day of October next, at Topsfield. In pursuance of these instructions the Committee propose to visit the several towns in the county in Sept. next, commencing at Newbury on the 1st day of the month. They will be pleased to call on all those who may manifest a willingness to receive their visit, and whatever improvement they may witness will be particularly recommended to the attention of the Society. Gentlemen who are willing that the Committee should see their farms will please to notify the same to some one of the members of the Committee, that they may understand how much duty they may have to attend to, and make suitable arrangements for the performance of it. The Farmers in the county are respectfully requested to aid the Committee in their inquiries, by forwarding to them such communications as they think will be interesting to the public.

For the Committee,

JOHN W. PROCTOR, Sec'y.

Danvers, July 8, 1824.

GEN. LA FAYETTE. In obedience to a vote of the City Council of Boston, of the 15th March, his honour, the Mayor, has addressed an eloquent letter to Gen. La Fayette, on the subject of his intended visit to the United States; and has received an answer which does honour to the head and heart of the veteran Chief. In the letter addressed to Gen. La Fayette the following passage occurs:

"The City Council of Boston, in accordance with the general wish of their constituents, have directed me to address this letter to you and to express the hope that, should it comport with your convenience, you would do them the honour, on your ensuing visit to the United States, to disembark in this city, and to communicate the assurance that no event could possibly be more grateful to its inhabitants;—that no where could you meet a more cordial welcome; that you could find no where hearts more capable of appreciating your early zeal and sacrifices in the cause of American freedom, or more ready to acknowledge and honour that characteristic uniformity of virtue, with which, through a long life, and scenes of unexampled difficulty and danger, you have steadfastly maintained the cause of liberty in both hemispheres."

An answer was received from General La Fayette, from which the following is extracted:

"I joyfully anticipate the day, not very remote, thank God, when I may revisit the cradle of American, and in future, I hope, of Universal Liberty. Your so honourable and gratifying invitation would have been directly complied with in the case to which you are pleased to allude. But while I profoundly feel the honour intended by the offer of a national ship, I hope I shall incur no blame by the determination I have taken, to embark as soon as it is in my power in a private vessel. Whatever port I first attain, I shall with the same eagerness hasten to Boston, and present it, beloved, revered inhabitants, as I have the honour, to offer it to the City Council, and to you, Sir, with the homage of my affectionate gratitude and devoted respect."

A Committee has been appointed by the City Gov-

ement to make suitable arrangements for the reception of Gen. La Fayette, and to prepare and present to him an address on his arrival.

FOREIGN.

Washington Irving is about to edit "a collection of English Literature," to be published in Paris in monthly numbers. The work is to be a selection from the best English works, with a biography of each author, either original by Mr. Irving or selected.

A new Journal published in modern Greek has lately been established in the island of Hydra, with the name of "The Friend of Law," of which five of the first numbers have been received by the New York American. They contain a considerable number of the acts of the central government. By one of these acts, the city of Napoli de Romania is established as the seat of government. By another, Panos Colocotroni, eldest son of the General of that name is declared a rebel. Another number announces that a younger son of the same General had been delivered up by its own soldiers into the hands of the general government. The father has likewise been abandoned by his troops—has submitted to the government, which had granted him an amnesty for the past.

The Greek Senate has addressed, through the medium of the Senate of Ipsara, energetic representations to the Consuls residing at Smyrna, complaining of the secret succour which was afforded to the Turks, and declaring they could not spare any flag which was abused for the purpose of furnishing arms, ammunition, and provisions for their enemies.

On Thursday last another experiment was made by Mr. Perkins, the American, to show the powerful effects of steam. His new machine has the propelling power discharging from a tube 200 musket balls in one minute. A ball discharged from it at a given distance as flattened as thin as a shilling, and Mr. Perkins has no doubt, he could by the same means produce sufficient force to discharge fifty twenty pound balls in the same period of time.—*London paper, May 27.*

Accounts from Lisbon of the 15th May, would seem warrant the conclusion that the King of Portugal as about to open his ports to all nations, and grant a charter or constitution to his people. He is stated to have called on his ministers to present him a draught of regulations for making Lisbon a free port, and that the 5th of June had been fixed on as the day for issuing decree taking off the duties on salt and wine.

Accounts from Maranhão to the 30th, and from Bahia to the 20th March, state that advices had been received of the intention of the Portuguese Government to send an expedition against the Brazils. There was consequence the greatest sensation produced; the Europeans were much alarmed for their property, and for their personal security.

Captain Brooke, in his recent travels to the North Cape, states it as a fact well authenticated, that there the skeleton of a whale on the very summit of the mountain Sandhorn, which is upwards of three thousand feet high; the south side descending nearly perpendicular to the sea.

DOMESTIC.

Milking Cows.—An article has been for some time going the rounds of the news-papers, purporting to be an account of a new and expeditious mode of milking cows. Whatever importance may be attached to this, it is far from being a new discovery. We are acquainted with many individuals, who have often seen it practised, and practised it themselves when they were boys, without ever dreaming that their ingenuity entitled them to rank on a level with Franklin or Jenner; it appears, however, that men of experience and practical learning on these subjects very much question the utility of the method, and have even endeavoured to prove that must be attended with positive injury to the animal. Among those who have written against it, is Professor Jerome F. C. Smith of the Berkshire Medical Institution, a distinguished anatomist. He asserts that the operation

of milking cows, by means of straws or tubes inserted into the ends of the teats must, if often repeated, materially weaken the muscles which act in retaining the milk, if it does not finally result in producing an entire paralysis. We mention this that farmers may be careful not to adopt the proposed expedient too hastily.—*Hallowell Advocate.*

Extreme Heat.—The heat for four days previous to the 1st inst. was so intense at Charleston, S. C. that the Courier says "we have endured almost literally an atmosphere of fire. Several valuable persons have fallen victims to the excessive warmth—and the poor, who are compelled to labor, find the chance of sudden death, added to their overwhelming toils. All are alike annoyed, and all alike repeat the prayer, that heaven, in its mercy, would mitigate the solar beams, and gladden us again with refreshing showers."

An unfortunate accident has deprived our community for a season (brief we trust it may be) of an useful and estimable citizen. On the 16th ult. Ebenezer Baldwin, Esq. in attempting to escape from a wagon, the horses of which were running, broke his leg below the knee. We understand the fractures are several and severe. He was riding in company with H. Knickerbacker, Esq. and a gentleman of this city, and was at Scaghticoke Point when the tongue of the wagon broke, and the horses became altogether unmanageable. Mr. Wells escaped unhurt. Mr. K. was slightly injured; the driver considerably so. Mr. Baldwin was conveyed to the house of Judge Smith, at Scaghticoke Point, and is now there.—*Albany Argus.*

Steam Boat Accident.—On the 12th inst. the boiler of the steam ferry boat Jersey, burst on the Jersey side of the North River, near New York, and killed Miss Charlotte Nelson, a young lady about nineteen years of age. The master of the boat, Captain West, was so severely scalded that it was feared he could not survive. A colored man was also badly scalded.—This accident cannot be accounted for on any known philosophical principles, if the statements respecting it are correct. The boiler it is said was copper, just finished on the low pressure principle, the furnace of which men copper. The safety valve, it is affirmed, was open at the time the explosion took place. The explosion was powerful; the boiler being twisted and torn to pieces, thrown a considerable height into the air, and fell in a direct contrary position to that in which it originally was placed.

Imported Bull—SIR ISAAC.

THIS very fine young animal, just arrived from England is of the true *Herdshire* breed, having been presented to the "Massachusetts Society for promoting Agriculture," by Admiral Sir Isaac Coffin, together with a superb COW of the same breed. They have been placed by the Trustees on the Farm of John Prince, Esq. at Jamaica Plain, in Roxbury for one year. He will be permitted this autumn to go to but few cows at *Three dollars* each, which must be paid in advance.

As many persons, however, who have fine cows, do not wish to raise calves, Mr. E. will agree to take them at six weeks old, at their real value, and not charge for the use of the Bull.—The Trustees hope by this means, many more fine animals will be raised for public benefit. His colour is a beautiful *dark red*.

The *Pedigree* which is furnished by one of the first breeders of this stock in England says, "He was got by Waxey—Waxey was by Trojan, which was challenged against any bull in England for 100 guineas. Waxey's Dam was Brunette out of Margaret. This bull's dam is Young Charnier own sister to the *brown* one that won the premium at Bath, last Christmas, and afterwards was exhibited at Bristol for Show, and considered the fattest cow in the kingdom. Young Charnier was out of Old Charnier, killed at Hereford for the Christmas Show of fat Beef and was superior to any there." This pedigree might be extended further back, but it is considered unnecessary to persons who will view the animals.

Roxbury, July 12, 1824.

WANTED No. 43, of the 1st Vol. of the N. E. Farmer. For which a generous price will be given by the publisher of this paper.

GIRL FROM 10 TO 14 YEARS OF AGE.
WANTED to take from the country a girl of the above age, and of a good disposition, until she is free.—Such an one will receive kind treatment, and be taught the rudiments of an English education—will have her board and clothing found her, and will be furnished when free, with two or three extra suits.—None need apply without good recommendations.—Inquire at this Office. July 17.

PATENT STEEL SPRING HAY FORKS.
JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Manure FORKS. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warranted steel back do, Ebsbee's cast steel polished Shovels—together with a great variety of other agricultural implements. June 12.

Our Correspondents, for some weeks past, have been liberal in their contributions for our columns, for which they are requested to receive our grateful acknowledgments. We have communications from Mr. Preston "Cultivator," "A Farmer," "Author of Tonches on Agriculture," &c. which shall meet with due attention, as soon as we have leisure to examine, and room to insert them.

BY T. G. FESSENDEN.

"Having food and raiment, let us therewith be content."

Art thou blest with food and raiment,
Give God thanks for favours given;
Gratitude is all the payment
Thou can'st make indulgent Heaven.

Clothing coarse, and scant subsistence,
Recompence which labour brings,
With contentment make existence
Happier than the life of kings;—

Why in heaping useless treasure,
Shorten life, and health destroy;
Where's the profit or the pleasure,
Hoarding what you ne'er enjoy?

Why, for Mammon's paltry proffers,
Sell thyself to sin a slave
Can the wealth, which swells thy coffers,
Buy exemption from the grave?

Since the thread of life is brittle
Heed the poet's moral song,
"Man in this world needs but little,
And that little needs not long."

Wants by luxury created—
All of artificial kind,
By indulgence never satiated,
Weaken and debase the mind.

To the hardy child of nature,
Decent clothes and frugal fare,
Furnish pure enjoyments greater
Than the pamper'd monarch's share.

Gold by avarice that's hoarded,
Might as well be in the mine,
Wealth that's generously afforded,
Can alone be counted thine.

Then, if blest with food and raiment,
Let thy gratitude be shewn,
No man's merits, as a claimant,
Give a right to these alone.

Miscellany.

Pores of the Human Body.—By applying a good microscope to the skin of the human body a multitude of small pores will be seen, through which perspiration is continually issuing. It is calculated that there is a million of these pores in every square inch, and 2,016,000,000 in the whole body of a middling sized person. The body exposed in the rays of a burning sun, appears through a microscope to be surrounded with a cloud of steam. Let any person hold the tip of the finger at the distance of 12th part of an inch from a looking glass, and the surface of the glass will soon be dimmed by the matter issuing from the finger.

Many experiments have been made to ascertain the quantity of perspirable matter which is emitted from the skin. It is stated in the N. E. Encyclopedia, that Mr. Gordon put his hand into a glass vessel closed at the wrist, and by keeping it there about an hour, he collected 30 grains of liquid which had issued through the pores of the skin. On repeating the experiment in the evening he collected 12 grains.—The mean of these, 21 grains, taking 21 grains per hour, and supposing the hand to be one six-

tieth part of the surface of the body, the perspiration in 24 hours would amount to 5 pounds 3 ounces troy. Sanctorious says, 5-8ths of all the aliment received by the mouth is carried off by perspiration. Dodart says 7-8ths. Others estimate it at much less, making it about two pounds per day. The quantity of sweat, or perspirable matter, varies according to the climate, season of the year, age, sex, state of health, &c.

It is by a peculiar smell which the substance emitted by the skin gives to each individual, that the dog can discover his master, and even trace him to a distance.

Previous to an election in Ireland, a landlord of considerable fortune and interest went over to his estate; he saw one of his tenants digging potatoes, and thus addressed him:—"Paddy, how do you do?" Paddy, unaccustomed to such a salutation, looked wildly round to see from whence it could come; on perceiving his landlord, and taking off his hat, he answered, "pretty well, Sir, I thank you; I hope I see you well." The landlord continued his conversation by asking, "what news have you, Paddy, in this part of the world?"—to which the tenant replied, "in truth, Sir, I have none, except that I think we shall soon have an Election, or some such sort of thing." The landlord asked, "what makes you think so, Paddy?" The tenant replied, "only because your honour never axes me how I do, except about that time!"

An old Rattlesnake.—Last year, (says the Louisiana Advertiser) a rattle snake was killed on Bullard's plains, in the parish of Feliciana, which had not less than one hundred and thirty-seven rattles. If the generally received opinion, that the number of rattles denotes the age of this species of the serpentine race be correct the snake must have been as many years old as it had rattles. The oldest inhabitants of that section of our state have never previously seen one with more than forty rattles.

A monument, of Parian marble, has been erected in the church of Newtownards, (Ireland,) to the memory of the late Lord Castlereagh, bearing on it the following inscription:

Sacred to the Memory of
Robert, Second Marquis of Londonderry;
He was born A. D. 1769,
And having filled many of the highest stations in
public life,

Succeeded to the paternal honors and estate in
April, A. D. 1821.

He died at North Cray, in Kent, August 12th,
1822.

His remains were interred in Westminster Abbey.

History will record the success and splendor of
his public career, during a period of
difficulty unexampled in the
annals of Europe.

This Tablet commemorates his private worth and
the virtues of his personal character.

Foremost among the statesmen of the age,
He was not least distinguished by the faithful discharge
of all the duties of social life,

As a son, a brother, a husband, and a friend,
His memory will ever be cherished with affection-
ate veneration

By those who find their only consolation, for his
loss, in the recollection of his virtues,

This tribute

To the best of brothers and of friends,
is offered by

Charles William Vane,
Third Marquis of Londonderry.

Philadelphia Society for Promoting Agriculture.

JOHN SCOTT, Chemist, late of Edinburgh, by his will, made in the Year 1816, bequeathed the sum of £4000, in the funded 3 per cent Stock of the U. S. to the Corporation of the city of Philadelphia; to the intent "that the interest and dividends, to become receivable thereon, should be laid out in Premiums to be distributed among ingenious men and women, who make useful inventions, but no such premium to exceed \$20; and that therewith shall be given a Copper Medal with this inscription—"TO THE MOST DESERVING."—The Select and Common Councils of the city of Philadelphia, have entrusted "the Philadelphia Society for promoting Agriculture," with the distribution of the aforesaid premiums and medals, and a Committee of that Society have been appointed to attend thereto. The subscribers named as that committee, give notice that they will receive applications for the same.

Certificates of the originality and utility of the inventions must accompany the applications, which may be directed "to the Committee of the Philadelphia Society for promoting Agriculture, on Scott's legacy," and forwarded free of expense, through the post office.

A description of the inventions, must be given in clear language, and correctly written, accompanied by drawings in perspective and detail, where necessary to illustrate it. Where the invention is a composition of matter, specimens of the ingredients and of the composition of matter sufficient in quantity for the purpose of experiment, and to preserve in the Cabinet of the Society will be expected.

NEW ENGLAND MUSEUM.

76, COURT STREET, BOSTON,
CONTAINING much more numerous Collections
and greater variety of entertainments than any
other Establishment in America, continues steadily to
increase, and is open for the reception of visitors
EVERY DAY AND EVENING.

It will be constantly in the best possible condition,
and every exertion made to render the visits of its patrons agreeable.

This Establishment now contains FIVE former Museums united in ONE, together with very great and numerous additions (the whole receipts being faithfully laid out to increase it.)

JUST ADDED,

The celebrated Race Horse Eclipse,
A beautiful Cosmoramic View of London,
A large and beautiful live Rattlesnake,
The Arabian Bottle, made of the stomach of a Camel—holds about a barrel—used to carry water across the desert.

The Invalid's Chair—very ingenious—invented by Professor Peck.

A very large and elegant Sword Fish, upwards of 14 feet long, with a sword 4-2 feet long.

The Museum is well lighted, and a Band of Music performs every evening. Admittance 25 cents.
June 5.

MR. GROVE'S *Essay on Sheep*, in a pamphlet form for sale at this Office. July 10.

TO PRINTERS.

FOR sale at this Office BALL SKINS, at the usual prices.
June 12.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the publisher,) until arrearages are paid.

NEW ENGLAND FARMER.

Correspondence.

To the Editor of the New England Farmer,

SIR,—I am in hopes that the eastern gentlemen of observation may publish their remarks on the effects of the late untimely frosts on the different kinds of garden vegetables, apples, &c. for as far as I can yet observe, I perceive there is a material difference, and that seeds of the same kind, obtained from the northward withstood the frosts and cold better than those from the southward. If it was generally known what kinds are best to withstand cold, a proper and timely attention to raise more of such kinds, would in some measure prevent so general or great a loss in future as has been experienced this season, should such frosts and cold seasons gain visit us. At present I do not consider the season far enough advanced to make such remarks as fully as may be done in autumn, yet the progress of vegetation should be daily observed.

I have observed in your paper, No. 47, an advertisement of the branches of science to be taught in the *Gardiner Lyceum*; and amongst these *Surveying, Protracting, and Dividing of land, Measuring timber, Carpenters' work, &c.* these branches were formerly my professional business, and every farmer ought to understand how to measure or divide his lands; and so much mechanics as to lay out, and construct his own windmills, mills, or implements of husbandry.

I would wish to correspond with any of the professors on those subjects, through the medium of your paper, that it may be beneficial to each of the rising generation as are not circumvented to attend proper schools or lectures. I consider my new invented science of *Semi-Geometry* (although it may yet be in the cradle) to be a desideratum in those branches. It simplifies, and obviates the necessity of any difficult calculations, and I have no doubt, if generally introduced to practice, would render most calculations as obsolete as the rules of *Vulgar Fractions* would be to add dollars and cents together. Any irregular shaped field may be surveyed with a rod pole, protracted on a smooth board, with a carpenter's square and compasses and the contents found in one sum, without regard to the courses or any calculation whatever—or divided in any form that every farmer may learn to be his own surveyor with such cheap instruments.

Semi-Geometry considers the contents of all kinds of geometrical figures as numbers, teaches how to reduce any form to any other of the contents to find the contents or to add, subtract, multiply, or divide them by each other in the Rule of Three and find the true proportional, to obtain an answer in any given regular form without knowing the contents, without any calculation whatever, simply, by a plain scale of equal parts and pair of dividers.

The difficulty in publishing the problems is to have circles printed without the expense of engravings. Some simple, easy questions in which the diagrams of the answer will not require circles, I may add to this account of the science.

In Reduction.

1st. Reduce the contents of a circle by having the diameter given to a parallelogram, a right-angled triangle, an oblique angled triangle, and a square; each of the same contents as the circle without any calculation?

For Rod-pole Surveying.

2d. Suppose I have a true draught of any irregular five sided field, say by a scale of 30 to the inch what is the true contents in one sum without any calculation?

To divide land by Rod-pole Surveying.

3d. Suppose a man has a large pasture-lot in an oblique triangle of any proportion or dimensions. On any point in the hypothenuse, there is a pond of water, and he wants it divided into five equal parts each to corner together in the water. How am I to so divide it with no other instruments than a rod-pole, and carpenter's square and compasses?

If these questions are not answered in three months after insertion, life and health permitting, I will send diagrams, and the answers all in straight lines that may be printed with precepts for the drawing of them. Or I would correspond with any gentleman on the subject provided it is through the medium of your paper for the benefit of the rising generation, and not from any motive of banter or vanity.

SAMUEL PRESTON.

Stockport, Pa. July 10, 1824.

BUTTER.

To the Editor of the New England Farmer,

SIR,—Should the following remarks relative to butter, meet your approbation, you are at liberty to publish them in your valuable paper.

Butter is a necessary and important article for family use, and no householder thinks his stock of provision complete without a good supply thereof. With many of our farmers this article may properly be considered a staple commodity and a principal source of wealth. And notwithstanding the low price it bears in the market, the continual wants of the people make a constant demand for it, so that the seller is always sure of finding a vent at some rate or other.

In order to make good butter a few things are essentially necessary and ought always to be observed. The best cows should be selected, regard being had to the quality and not the quantity of milk which they give. In summer they should have plenty of sweet feed and during the winter be kept upon the best of English hay. They should always be milked, if possible by the same person, and the one who milks ought ever to be careful to milk them perfectly clean as the strippings or that last drawn is much the richest and best. Milk, when taken from the cow should be immediately strained into broad shallow pans and placed if the weather be hot, in as cool a situation as possible as this will cause the cream to rise sooner and render it somewhat better than if placed in a milder temperature.

Every thing that is used about the milk or cream should be kept perfectly clean and sweet

and the churning performed before the cream becomes sour or changed by reason of age.

As soon as the butter is taken from the churn it should be moderately salted and afterwards worked over several times in order that every particle of the buttermilk may be separated from it. The want of caution here is probably much oftener the cause of bad butter than the want of more salt as very little of this will preserve it when thoroughly cleansed.

The tub or firkin into which butter is to be packed down, if new, should be filled with water and soaked several days, then emptied and well scalded with boiling whey, and then thoroughly dried.

After the cask is thus prepared the inside should be well rubbed over with salt, when the butter may be put down, being careful not to fill the tub so full as to have the lid or cover touch the top of it, which will tend to melt the salt which should be sprinkled over the butter, and thereby cause it to taint and spoil.

The practice of colouring butter ought to be reprobated and abandoned, and even prohibited by law. No one will pretend that it is any better in point of taste or flavor for being factitiously coloured, and why should the health and lives of people be endangered by such deception. It is a notorious fact that butter of this description will command a higher price in market than that which is equally as good or better in every point excepting that it is unpolluted and in its native state.

Why do people who depend on the market for their daily supply give the preference to butter of this description, and thereby encourage knavery and deception to the injury of those who are just and upright.

A candid, honest man would rather sell his butter for half its value, than make use of deception and intrigue for the sake of getting an extra price. In all cases honesty is the best policy and every wise man will adhere strictly thereto and eventually it will turn to his advantage.

CULTIVATOR.

Worcester County, July, 1824.

BY THE EDITOR. We wish that our cultivators would try the following receipt by Dr. Anderson for preserving butter.

"Take two parts of common salt, one of brown sugar, and one of salt petre; beat them together so as to blend the whole completely, and apply one ounce of this to every pound of butter; work it well in the mass, and close it up for use."

"This," says the Farmer's Assistant, "will cost about a cent a pound more than by curing butter in the usual way; but its peculiar excellence is that butter thus cured will keep sweet for two or three years; and its taste is much superior to that which is cured in the common way. It must not, however, be used sooner than a month after it has been laid down, as it does not acquire that rich marrowy taste, until about that length of time. Butter, cured in this way, and laid down for winter use, will then be found worth at least twenty-five per cent. more than that cured by salt alone."

The natural colour of butter depends chiefly, if not

altogether on the quality of the food with which the cows are supplied. Give them rich and nourishing food, and the butter you make from their milk will have a yellow colour and a delicate flavour. It is likewise said that the juice of carrots added to cream will give it a yellow appearance. Feeding cows with carrots will have a similar effect, and answer a still better purpose. A poor half starved cow will yield but little butter, and what you do obtain will be inferior in quality, as well as deficient in quantity.

ENGLISH BREED OF SWINE.

To the Editor of the New England Farmer,

SIR,—A few weeks ago you published a few remarks of mine respecting a species of swine denominated the English breed.

These remarks it would seem have fallen under the scrutinizing eye of Dr. Fiske, of this town, a gentleman who is justly deserving the attention and regard of the community, and for whom I entertain feelings of high esteem and respect on account of his laudable exertions in promoting the interests of agriculture, &c.

It appears by a communication of his published in your paper of June 19, that he considers his stock of hogs unjustly censured and misrepresented by the remarks above alluded to.

He undertakes to prove in a very judicious and proper manner the superiority of his over other kinds of hogs, and intimates that if "I should chance to have an interview with his family of this description he doubts not that I shall feel impelled to give gentlemanly satisfaction for having publicly traduced their character."

Now I can assure the Doctor that in making these remarks I had no reference to his family or any of his progeny. As I live more than four miles distant from him I never visited his hog sty, and I do not know that ever I saw any of the race.

I had reference particularly to a kind of hogs brought from Cambridge by a gentleman in a neighboring town contiguous to this which he called the English breed. Several of my neighbours who reside within the limits of that town, but who may properly be said to belong to this vicinity, as I stated in my former communication have incautiously ventured to make trial of them, and I should think if their statements can be relied on to their great disadvantage. As I have heretofore appeared as an anonymous writer, I do not think it expedient now to mention names, but what I say, I solemnly aver in my apprehension to be the truth and founded on facts. Not only have several farmers who have obtained this kind of hogs stated to me their disapprobation of them, but the gentleman who first brought them into this region has in a degree lost his confidence in them. He informed me not long since that he liked them on some accounts but the grand difficulty was, he could not make them weigh enough. He said they generally appeared plump and lusty, and fattened easy, but they were too small. He states to me that he slaughtered half a dozen of them last spring being then about a year old, neither of which weighed 200 lbs. and some of them fell far short of it. He has now got rid of the whole race, save one, and is wishing to procure a larger kind if I understood his intimations aright.

Dr. Fiske's account respecting hogs is truly flattering and the testimony produced in their

favour is from such high and respectable sources. That I think I should not hesitate to make trial of them could I conveniently obtain some of the breed. I am confident that "I have no predilection for any kind but the most profitable," and am as ready to yield to evidence as the Doctor or any other man. A FARMER.

Worcester, July, 1821.

The following from the author of "*Touches on Agriculture*," should have been published some weeks since, but want of room, rendered it necessary to postpone the communication till the present period.

Brunswick, Me. June 14, 1824.

To the Editor of the New England Farmer,

SIR,—Thanks, if I have not before sent them for the kind review of my little "*Touches on Agriculture*." In my ill health I have slowly travelled among the farmers of Maine—tried some experiments, which I hope will be useful; regret I should have made a mathematical mistake as to the number of apple trees suitable for an acre. Dele 2 put by mistake on the left hand, and the theorem is nearer correct.

May 26, on the banks of the Androscoggin, ice in many places from 1-2 to an inch in thickness, as you ascend from the tide waters at Brunswick to Livermore. June 13, do. The apple tree first showed the full expanded blossom here June 1st. The caterpillar is claiming his full share of green from the leaf. I adhere to my process of burning them off as soon as they appear, rather than build a Babel in miniature, heavy as a Colossus to bear from tree to tree, to give me the exquisite pleasure of squeezing them to death with my fingers. *But de gustibus non est disputandum* [there is no disputing about tastes.] Your correspondent on squeezing caterpillars cannot be a subject of envy, and I ask in sincerity, is not my burning plan a safer, quicker and cheaper way?

A few days since, a Cuckoo struck on a tree, where I had burned off a caterpillars' nest, when the inhabitants were not all at home. These industrious Muscovites soon began to repair their ruined castle. They worked four days and I could hardly find a heart to disturb their labours. The bird sought the nest, perforated it in three places and in a moment took every lodger for her dinner. I should advise thumb and finger caterpillar squeezers, to purchase a few of these valuable birds for domestic use; but as it is late in the season for the destruction of these unwelcome intruders, my advice may be no better than an old Almanac.

The lilac opened in warm places June 1st. I have noticed lately, apple trees entirely killed by the roosting of turkeys on them. This seems to corroborate the assertion of the Rev. T. M. Harris of the destruction of large forests in Ohio.

June 18. I have heard from a number of towns this morning, that there was considerable frost in low lands. Contrary to my expectations grass promises but an ordinary crop in sections of Maine, which have been considerable exporters of hay to Boston. Clover I find on lands in good case in blossom at three or four inches in height.

Ice lay on most lands from the last of January to the last of March, in Maine and the crops are much winter killed.

An intelligent young man from the lakes at the head of lumbering on the Kennebec, says that on the 5th of May, snow was four feet deep in the woods. The accounts from Quebec to the 10th corroborate it. The red top grass has not to my knowledge been fairly tested in the low lands of Maine. I believe it to be most certain, especially in cold seasons on deep, springy lands, and holds out the longest. It would much please an earnest advocate for your paper to know how it is now estimated in Massachusetts. I have given my opinion in my "*Touches on Agriculture*."

I have just received a communication from Mr. James Jordan, of Lewistown, Me. an inquiring farmer. He says, in 1823, he raised 24 bushels of fine wheat per acre. Corn grew on the land the preceding year. As he ploughed the corn hills, he collected all the corn stumps carried them from the field to burn into manure. On a neighbouring piece they were knocked to pieces on the surface. The wheat was cut by the fly on the latter. On a strict examination of corn butts, he says, he finds a very small maggot between the two first joints of corn above the surface, and inquires may they not be the origin of the Hessian fly. That takes wheat between the same joints, and whether wheat in the Middle states is not often the immediate successor of corn? Perhaps his suggestions may be worth a little inquiry.

Many men of literary acquirement, deem it beneath the dignity of soaring minds to descend to the examination of the minutiae of nature: and many farmers as well as unfeeling sportsmen, seem totally ignorant of the value of small birds that sweetly carol around them. I am led to these reflections from the recollection of an excellent dissertation on wanton bird shooting in the New England Farmer, vol. ii. page 317.

I have had a wren, (the smallest of birds, I know, except the humming bird) that has been imprisoned 30 hours, denounced as a nuisance to society by all the neighborhood. I gave her latitude and departure, so that she might traverse two windows in the room. After the agitation arising from the confinement was over, I drove the flies in the room to the windows within her reach. She soon made a conquest of them all. A neighboring farmer has just informed me that four young robins lay dead in their nest, and charges wrens with the murder. Doubts whether the favourite robin falls a victim to such a little bird, induce me to prolong confinement for further information. It is thought by many in Maine, that many large birds fall victims to the apparently insignificant wren. The nest of a wren has just been found containing five feathered young. By an unanimous family vote of the robin losers, they have been ordered to execution, my arguments contra not prevailing. As

"All nature's difference keeps all nature's peace," I have doubted, whether we ought to attempt to break any of the smaller links in the chain of creation.

The martin is truly a domestic bird, build it an habitation near your own, it is soon filled with inhabitants. The swallow seeks your barn. Some years since I was usually situated, where musketoes were abundant; many stagnant pools around. From a close examination of the movements of the swallow, I conclude one will take at least two thousand of these mu-

sical neighbours a day; and fifty of them may give the farmer not a little trouble in a hot night.

I recollect a notice in the Boston Centinel some twenty-five years since, that there had been a famous blackbird hunt in a town but a little to the northward of Boston on Election day. 1940 birds were taken. Some good cause thereunto moving they spared the Parson's meadow. It was a year of canker worms. The Parson disliking this cruel sport, spent the next day in his orchard, and calculated, that a blackbird, whose nest was fifty rods distant, carried as many worms to her nest that day, as the sportsmen had killed birds the day before.

I have noticed the recent dissertations on the best method of destroying lice on the apple tree and can only repeat what I have before said, from much additional evidence, I am satisfied the cheap composition I have used, kills the wood lice instant, keeps the woodpecker from wounding, operates as a powerful manure and makes the tree hold its fruit. These destroyers both of fruit and tree are much more abundant in the high latitudes of Maine, than in the more southern New England States.

Author of Touches on Agriculture.

EASY METHOD FOR KILLING BED BUGS.

To the Editor of the New England Farmer,

Sm,—I read in your paper of July 10, a piece from the American Farmer, stating that "a strong decoction of red pepper, would speedily kill or expel bed bugs." I tried the same twenty years since; it would kill them, but new swarms would soon appear; I afterwards tried corrosive sublimate, essence of tobacco, lamp oil, yellow snuff, spirits of turpentine, linseed oil, salt, brine, &c. &c. with no better success. In 1815, I used the following composition, and have since used it once in two or three years, and have not seen a bug in my bed since I first used it.

For two bedsteads, take six cents worth of quicksilver, [crude mercury] and the white of one hen's egg, beat them thirty minutes with a feather, and apply the mixture with the feather to all the joints, &c. of the bedstead.

DORCAS.

From the Vermont Republican.

CUTTING GRAIN.

Grain should be cut earlier than is ordinarily the practice, and before the field is fully whitened.—Almost every farmer has his peculiar rule, or *modus operandi*, by which he is governed. My rule is to cut my grain, when I can easily crush the kernel with my thumb and finger.—I find by experience, that there are many peculiar advantages attending this practice of early cutting. In the first place, you get as much, or more grain, notwithstanding the shrinking of the kernel. But when made into bread, its superiority is strikingly apparent. Your loaf will increase in size and beauty, and its flavour will be manifestly superior. The superiority of the straw is another important consideration, in favour of this early cutting; for cattle or horses it is vastly superior, and even for purposes of manure it is far preferable.—When grain stands late in the field, many of the stalks are crippled down, much is destroyed by vermin and birds, and immense quantities wasted in gather-

ing it by its scattering from the heads and sheaves. After cutting your grain at the period I propose, expose it a short time to the sun, then bind in small sheaves, and put it very nicely into the shock.—After this you need not be in haste to get it into the barn; should it stand out 20 or 30 days it will not be amiss.

SICKLE.

Poison by Ivy.—Many people during the season of hay-making, are grievously afflicted from the poisonous effects of ivy.—To cure which, my method has been, as soon as I feel its effects, to hold the part thus affected as near the fire as I can endure, for twenty or thirty minutes each day, until the inflammation subsides. My hay-makers, at my instance, have adopted this method of cure with uniform success.—Having always been easily affected by ivy, I have had occasion to resort to this mode of cure for thirty years past. In addition to my own experience, I have seen it recommended in several agricultural papers.

SCYTHE.

The Canada Thistle.—It has been thought next to impossible to destroy this most troublesome weed,—but experience has proved the following method to be effectual, viz.:—Cut off each Thistle about half an inch below the surface of the ground, and then put on it a gill of coarse salt. Fish brine may be used instead of salt, and will answer the same purpose. If in a bed of these thistles, a few should escape the first year, the above operation should be carefully performed on them the year following. The summer season, when the thistles are in full growth, is the proper time for doing this business.—*Con. Mirror.*

Poisoning by Arsenic.—A physician informs us of the following case, which has recently happened in his practice, at the northern part of this city. The house, where the patient resides, had been so much infested with rats, that the occupant, after suffering awhile their alarming depredations, mixed a quantity of arsenic with Indian meal, and, besides in other haunts of these mischievous animals, placed a quantity at the mouth of an ash-hole, in the kitchen. Unfortunately, one of his young children got to it, and swallowed a considerable portion. As soon as possible, large doses of sweet oil were administered, and, immediately after, an emetic, by which nearly all the meal was thrown off the stomach. The child continued to be affected with vomiting and drowsiness, accompanied with severe spasms, and laborious breathing, until alkalies were resorted to, in conjunction with oil. After a close and unremitting application of these remedies, for several days, the patient became convalescent, and, we are happy to say, is now perfectly recovered.—*Bos. Med. Intell.*

Nahant.—"We cannot forbear speaking here, of the wonderful coolness and beauty of the climate at Nahant. Every body who wishes to be refreshed and invigorated should visit that delightful and salubrious spot. The air is never as hot as in Boston by 15 degrees, and its heat is always prevented from being uncomfortable, by the breezes from the ocean. Infants who have languished under summer complaints in this city and vicinity, have immediately begun to recover, on being carried to Nahant; and we have often remarked a wonderful change

in these little patients within an hour after their arrival. Indeed we could go on and write columns on the blessed virtues of the Nahant air, but the amount of them all would be, that every body who wishes to get well or feel well in summer, must go down to Nahant."—*ibid.*

From the New York Statesman.

COMPARATIVE LONGEVITY.

Dr. Ramsay in his sketch of South Carolina, in speaking of New-England, remarks, that "as many of their inhabitants reach 85, as of ours who attain to 70." And I saw mentioned a few days since, the great age of some persons in a grave yard in Connecticut.

Some years ago I was in the town of Groton, in that State (Connecticut), a high, hilly, rocky district of country, within a few miles of the sea coast. In the second society, a parish of that town, being detained by the weather one rainy day, I had the curiosity to examine a register of the deaths of the inhabitants of that society for 45 years past, not including those which were occasioned by accidents, by diseases of foreign climes, or occurred in the slaughter at Fort Griswold, in the American army, or the Jersey prison ship, &c. The result exhibited a degree of longevity which I little expected to find, as well as I was acquainted with the salubrity of the air, and temperate habits of that region. And I am inclined to think, that the schedule will bare a comparison with tables of mortality in any other part of the world whatever. Of this, however, I leave the reader to judge.

The total number of deaths was 623, of which 100 were of the age of one year and under, leaving

Over one year	523		
Of which were from	70 to 80	73	
	80 to 90	65	
	60 to 100	15	
Over	100	1	
Over	70	155	
	80	82	
	90	17	
	100	1	

This gives 1 of 100 out of 623 births. European registers give but 1 of 3126. (In Charleston in 1790, of 8000 inhabitants, 100 were over 70 and 1 over 100.) We all know that a hilly country is favourable to long life. But the different calculations and comparisons, I cannot recollect, not having Price's tables, or any other at hand. Perhaps this hint may invite more interesting and useful recollections on the subject.

H.

From the American Farmer.

TO DESTROY COCK-ROACHES.

By a gentleman in the South.

The correspondent in the American Farmer of the 25th inst. may be assured that the common Hellebore root, found on low grounds and near water courses in Maryland and Virginia, is as completely destructive to the cock-roach, as arsenic or corrosive sublimate to the human race.

Chip it with a knife, and strew where the roaches will find it. They eat it with avidity and as certainly perish.—Known from

ACTUAL EXPERIENCE."

HEDGE FENCES.

In the New England Farmer of May 29, page 345, vol. ii. we published an extract of a letter from James Whitelaw, Esq. of Ryegate, Vermont, requesting information on the subject of "raising hedges." The following article will supply the best in our power to obtain, and perhaps the best that can be obtained. We have waited on Mr. QUINCY, now Mayor of this city, requesting further intelligence on this subject, and he has assured us that the Hedge Fence, described below has completely answered his expectations. It has been supposed that the English White thorn was better adapted to the purpose of forming fences than the American thorn. Mr. Quincy, however, is of a different opinion. He says, in substance, that although the English thorn has a stem stronger than the American thorn, its growth is slower, and it does not retain its verdure so late in autumn. The American thorn on the whole, he thinks, is to be preferred for the purpose of making fences; although the English thorn has some qualities of a superior nature.—Some assert, however, that a good post and rail fence, the bottom of the posts being well charred or thoroughly scorched in a blazing fire, unless timber is very scarce, is to be preferred to either. Dr. Cooper, editor of the last edition of Willich's Domestic Encyclopedia, is of this opinion.

From the Massachusetts Agricultural Repository for June, 1813.

ON THE AMERICAN HEDGE THORN.

BY HON. JOSIAH QUINCY.

To the Corresponding Secretary,

SIR,—Live hedges are objects of so much importance, in those parts of this State, where stone cannot be easily obtained; and knowing that a mistaken opinion prevails concerning the expense of this species of fence, I think it will be useful to communicate the result of an experiment made with an express reference to this point.

In March 1808, I imported 10,000 seedling thorns from the nursery of Thomas Main, near Georgetown in the District of Columbia, of that species which he calls the "American Hedge Thorn." These were planted in a hedge course, which, in its whole length, was two hundred and fifty-five rods; so far as was necessary, to fill that extent in one line, each plant being five inches apart. The residue were planted in a nursery for the purpose of filling vacancies, which might occur by death or accident.

The hedge course was made in a sord land, ploughed of the width of four feet, and manured and prepared, precisely as if for Indian corn; except only that after ploughing, the centre, for two feet wide, was turned over with the spade. Without other preparation, the hedge was planted in April, 1808, on a level, without either bank or ditch.

As I intended this as an experiment, to test the utmost cost of a hedge destined, not for ornament, but for farm use, I directed the tenant of my farm, (Alpheus Cary of this town,) a very faithful and intelligent farmer, to make a separate charge for all the labor bestowed upon it in his account with me, and I paid, without any question, every such charge at the price he affixed; being determined that no particular economy should render the apparent, less than the real expense. I consider the ex-

periment now as completed, so far, at least, as is necessary for a satisfactory ascertainment of the cost of this species of fence. For the expense of the hedge, this year, has been nothing except the annual trimming. It is, upon an average, nearly five feet high; and a sufficient security against cattle, for almost the whole extent; and is every day strengthening, without any application of attention or labor.

The following is a statement of the expense:

25 rods, or 4207 1-2 feet is 3415 plants:—
say \$500 at \$5 per 1000 . . . is \$12 50
Reserved in the nursery 1500 . . . 7 50

10,000 plants . . . \$50
Package and freight . . . 3 75

Cost of the thorns at and from Georgetown . . . \$53 75

Labor. 1808, April. Equal to nine days, (ox-
(en and manure included) breaking
up and preparing hedge-course . . . \$14
do. Setting-out hedge . . . 13 days 12 92
do. May, hoeing . . . 4 do. 4 00
do. June, hoeing & sundries . . . 9 1-2 do. 11 63
do. July, do. . . 7 do. 7 00
do. August, do. . . 1 do. 1 00
do. November, do. . . 5 do. 5 00

Cost of labor, &c. first year . . . \$55 55

do. 1809, April. Hoeing and filling
vacancies . . . 3 days \$3 00
do. May, June, July and August, hoe-
ing . . . 19 1-2 days 19 50
do. November, treading snow, against
mice . . . 1 day 1 00

Cost of labor the second year . . . \$23 50

do. 1810, February. Cropping hedge,
one day . . . \$1 00
do. April and August. Hoeing and fill-
ing vacancies, 10 1-2 days . . . 10 50

Cost of labor the third year . . . \$11 50

do. 1811, February. Trimming hedge,
one day . . . \$1 00
do. April and August, hoeing, 7 days . . . 7 00
do. Sundries . . . 1 13
do. November. Trimming hedge, one
and a half days . . . 1 50

Cost of labour the fourth year . . . \$10 63

do. 1812, April. Hoeing, 7 days . . . \$7 00
do. August do. . . 4 do. 4 00

Cost of labour the fifth year . . . \$11 00

do. 1813, February. Trimming the
hedge, two days . . . \$2 00

Whole cost of labour, &c. . . \$114 18

Whole expense of making 255 rods
hedge fence . . . \$167 93

There is no longer any labour necessary, and only general attentions, of a nature not worth an estimate are requisite.

From the result it appears, that two hundred and fifty-five rods of hedge fence, has cost less than sixty-six cents per rod; notwithstanding no particular attention was paid to economy in executing the work, and the whole was paid for at the cash value of labour. I have no doubt that where the labor is performed by the farmer himself, and those facilities adopted which experience and the usual attention of practical farmers would suggest, that a complete thorn hedge might be formed, in six or seven years,

sufficient against every ordinary danger, for an expense far less than fifty cents per rod. Practical farmers, in this neighborhood, are of the same opinion. The prejudice which was very strong in this vicinity, against the success of the experiment, is in a great measure removed.—Several farmers have declared themselves satisfied. One or two have determined to commence a course of hedging as soon as plants can be procured, and have actually taken measures for this purpose. I mention this fact, because the opinions of intelligent practical farmers are justly of more weight with practical farmers, than are the opinions of men whose habits of life do not lead them to a direct participation in the labours of agriculture.

The course best to be adopted, having reference to the economy of labour, is thought to be the following:

Plough the hedge course six feet wide. Plant the whole course one year to potatoes. This pays for the labor as much as other land thus planted. Set the thorns eight inches apart.—This is near enough in a country like this, where hogs are not permitted to run at large, and makes a considerable saving in the labour as well as the cost of the plants. Keep both sides of the hedge planted to potatoes, during the whole six years in which the hedge is coming to perfection. The potatoes will nearly pay the cost of the labour. The manure for the potatoes benefits the hedge; and while hoeing the potatoes, keeping the hedge clear of weeds is easy.

To keep the hedge clear of weeds, and to fill up the vacancies regularly, in the spring of every year, with plants of the same age with those of the original hedge, are the two essential objects of attention after the hedge-course is prepared and the plants are set. Younger plants may answer, but whoever would make a hedge, in the most speedy & perfect manner, ought to procure at the time of obtaining the plants for the original hedge, a sufficient extra number to supply all deficiencies likely to occur, through the whole time the hedge is forming; to be kept in a nursery thriving, if possible, a little better than those in the hedge-course. Experience has satisfied me, that two for every ten planted in the hedge-course, is a number more than adequate for this object.

In the statement of expense, I have made no allowance for protecting fences. Where these are necessary, their expense must be added. In my experiment, by excluding cattle, the necessity for them was obviated. Whatever these may cost, the economy of this species of fence, when its durability is taken into view, (to say nothing of its ornamental nature,) must be sufficiently apparent.

Very respectfully,

I am your humble servant,

JOSIAH QUINCY.

Quincy, June 25, 1813.

From the Portland Statesman.

SUREST METHOD OF DESTROYING CATERPIL-
LARS.

Early in the season take a pail on your left arm; a tin one is best, for the vermin will not one of them crawl up its sides; go with a light ladder, were you cannot reach them from the ground; take them when they are in their nests; hold your pail underneath, if you can, to prevent the caterpillars from scattering on the

ground, for in that case they will certainly ascend the tree again; gather up the nest carefully from the edges, so as to break it as little as possible; take it directly into your hand, extending your thumb and fingers around it, and put it into your pail; never flinch, the caterpillars won't bite you. When you have done, empty your pail into a river, or large brook, or a fire, or bury the contents in the ground half a foot deep, and tread down the earth hard and close, so that none may escape. If any of the nest are inaccessible on the ends of limbs, reach the twig with the end of a sharp saw and cut it off close to the body of the limb out of which it grows.

Now what signify rubbing oil on the nests or squibbing them with gunpowder, or trying to hold a smoke under their noses? It is all nonsense.—You may plague the poor creatures a little, if you take any pride in it, and injure your trees a little; and that's all.

This mode of taking the caterpillars is almost as much easier and cheaper than other ways of attacking them as it is better. Two years ago I went through my orchard in this way, and had hard work of it. One year ago I did the same, but found the labour small. The present year, while the orchards of my neighbours where the caterpillars have in ample form been insulted with grease, and powder, and smoke, are over-run; there have appeared in mine scarcely half a dozen nests.

A Lover of Apples and Cider.

IRON-WIRE BRIDGES AT GENEVA.

The two Bridges about to be described were long across the dry ditches of the fortifications of the city of Geneva. The ditch across which the first bridge is hung is 32 feet deep and 108 feet wide. It is bounded by the city wall on one side; and by the counter guard on the other. The counter guard is about 70 feet wide, the other side forms one boundary of the second ditch, which is 22 feet deep and 77 feet wide; pen the country forming the other boundary of the ditch.

The gate of the city, which stands on the edge of the first ditch, serves as a point of support to the wires of the first bridge, and also as a station for the bridge-keepers. The counter-guard is a stone arch, which in like manner, acts as a point of support to both bridges; and the outer gate, on the country side of the second ditch, is the other point of support to the wires of the second bridge.

The wire used in the construction of both these hanging bridges is about two millimetres, French measure, or 75 thousandths of an inch thick: being known in the shops by the name of No. 14. It is made up into lengths, or bundles of a hundred wires each every single wire having been first stretched straight by a weight of 220 lbs. These bundles were united by iron ties for the line of suspension proceeds uninterruptedly cross both ditches and the intervening counter-guard; it was too long for a single bundle. There are three of these lines of suspension on each side of the bridges, made up in length terminating at each end by a ring, and connected together by passing a strong iron bolt thro' the end rings of the bundles placed side by side; the whole being rolled round with iron wire, which gives them the appearance of cords. The

longest of these bundles are 120 feet long, the others rather shorter; and the whole six main lines of suspension were made fast at one extremity to a mass of iron firmly fixed to the inner gate of the city, then carried over the first ditch across the stone support in the counter guard, from thence over the outer ditch, and lastly, passing over the outer gate, they are made fast to iron blocks, which are deeply buried in the ground, and loaded with heavy masses of stone. To these six principal-lines, placed lengthways of the bridges and intervening counter-guard, others, composed only of 12 wires, are made fast to the traverses, or pieces of wood, which form the bottom of the sides; long beams of timber are mortised to these, to which the railings of the bridges, and upon the traverses, are fastened the planks, that form the roadway of the bridge. The whole of the work is well painted over; and the materials, both wire and timber, of the best quality.

Before the bridges were begun, a model was made, 38 feet long, hanging from two main lines, each of which was composed of only twelve wires, about the 75 thousandths part of an inch thick. From these main lines hung eleven traverses of wood, by means of four shingle wires, two at each end. The traverses being planked over, this model was found to have such strength as to allow the persons, who went to see it not only to march over it, but also to leap, jump, &c. without the least failure or accident happening.

The whole time, from the first planning of the bridge to the opening of it for passengers, did not exceed six months. The engineer, Col. Dujour estimated the expense at 16,000 francs, about £666 sterling, and the actual cost came within one or two hundred francs, 4 or £8. of the estimate.—*Mechanic's Weekly Journal.*

NETTLES.

Every body knows that the leaves of stinging nettles are thick set with sharp prickles that penetrate the skin when touched, and occasion pain, heat, and swelling, which symptoms were imagined formerly to ensue from the prickles being left in the wounds they made. But the microscope discovers something much more wonderful in this common vegetable, and shews that its prickles are formed and act in the same manner as the stings of living animals. Every one of them is found to be a rigid hollow body, terminating in the most acute manner possible, with an opening near the end. At the bottom of this cavity lies a minute vessel or bag, containing a limpid liquor, which, upon the least touching of the prickle, is squirted through the little outlet, and, if it enters the skin produces the mischief before mentioned by the pungency of its salts. Hence it comes to pass, that when the leaves of nettles are considerably dried by the heat of the sun, they sting but very little; whereas such as are green and juicy produce violent pain and inflammation.—*N. Y. Minerva.*

Whoever will apply an ointment made of gunpowder, brimstone, and common grease, behind the uicks of their Lambs, will be sure of having them preserved from all kinds of vermin. The quantity necessary to be made use of is so small, that a sixpenny worth is sufficient to dress upwards of 200 Lambs.—*Con. Herald.*

NEW ENGLAND FARMER.

SATURDAY, JULY 21, 1824.

CLOSE OF THE SECOND VOLUME.

The second volume of the New England Farmer being terminated with the present number, it will, perhaps, be expected that the Editor, in due conformity to immemorial usage on similar occasions, will take a retrospective glance over the field of his former labours, and a prospective view of that which lies before him. With regard to our past performances, we have no foundation for boasting; and as our promises and pretensions have never been of a high order, we hope we have not much to regret for having greatly disappointed reasonable expectations. Our efforts to deserve well of the agricultural part of the community have been unremitting, and we trust not altogether unsuccessful. Nor have we, at present, any reason to complain of want of patronage. Our subscription list has been, and still is constantly, though gradually progressive, and has increased about one third since the commencement of the present volume. Our correspondents are, likewise increasing in number, and in our opinion their communications, as our work advances, become more and more valuable.

The first minds in the country appear to be turning their attention to its paramount interests, and seem to be fully sensible that improvements in agriculture, the art of all arts, and the only sure and permanent basis of national, as well as of individual prosperity, must lead the van of all other improvements. The information, which the Editor himself acquires from his correspondents, as well as from other sources, which are daily developed in the progress of his publication, he flatters himself, has rendered, and he doubts not, will continue to render him better able to perform his task, as conductor of this Journal, in a manner which will enhance its utility, and prove satisfactory to its patrons. And, while life and health are continued, no effort on his part shall be wanting to merit success, in some degree commensurate to the importance of the objects to which the New England Farmer is devoted.

The Editor, however, does not presume to believe that he has fully met the wishes and expectations of all his readers and subscribers; and while to "err is human," and the opinions and taste of mankind are as diversified as their faces, he cannot hope to gain the entire approbation of every individual. He has no doubt, published accounts of some processes in Husbandry, and Rural and Domestic Economy, which will not bear the test of actual and repeated experiment. But his intentions have ever been upright, and he has been solicitous not to mislead the cultivator or economist by recommending receipts or modes of proceeding,

which, on trial might prove nugatory, or injurious to the interest of those, for whose use his intimations were designed. In stating improvements, remedies, &c. which might be attended with loss, danger or expense in case they did not succeed, he has, generally, and indeed always except by inadvertence, given his authority for making such statements; and after all has rather suggested the supposed improvement for consideration than prescribed it for adoption without further inquiry. He wishes his readers to think and judge for themselves, and would attempt nothing more than to produce from sources not obvious or accessible to every one, materials for thought, facts, arguments and theories for the judgment of his readers to operate on. Whenever he has been or may be in an error in his statements or recommendations he will ever be open to conviction, and happy to stand corrected by any of his readers, correspondents, or others, who will undertake so friendly an office. He claims no merit of invention or originality, but rests all his hopes of approbation on the basis of zeal, industry and good intentions.

We are induced to hope that we have not gone very widely astray in our mode of conducting the New England Farmer from the circumstance that the few complaints which have reached us have been of a different and opposite character. Some have intimated their displeasure because our paper has not been exclusively devoted to agriculture and other useful arts. Censorious persons of this description are hostile to poetry, anecdotes, &c. and would have us publish nothing which is not directly calculated to enhance the interest of the farmer, by increasing or rendering more valuable the products of his soil. Another description of fault-finders require of us a greater quantity of what is called *light reading*. They wish that a large proportion of our columns might sparkle with wit, sting with satire, or make one's eyes like unto fountains, and hair to "quills on the fretful porcupine" with the woeful and the terrible. They can perceive nothing at all in a page or a paragraph which contains nothing but what is useful, and may be turned to some practical purpose in the economy of human existence. Now, as it is impossible for us to go astray in different directions at the same time, and to turn to the right and left by simultaneous movements, and yet we are censured for such supposed incompatible deviations from the line of our duty as a journalist, we are induced, from that circumstance to hope that we have pursued, pretty nearly the right path, and presented to our readers the useful and the amusing in about due proportions.

Some gentlemen, who appear to be, and doubtless are well wishers to our paper, com-

plain that many of our articles are too prolix and our directions, descriptions, and rules of proceeding are so minute as to become tedious. To this charge we confidently plead not guilty. Articles, which relate to science or to art, must, frequently, if not generally deal in detail or they will not suit the purpose for which they were intended. Obscurity may comport with the sublime, but articles on the subject of agriculture are not intended to exhibit samples of that species of composition. Poor Richard says

"He that would increase in riches
Must not hoe corn in silken breeches;"

and he that would furnish remarks relative to the culture of corn and potatoes, must not attempt to clothe his ideas in brilliant phrases. Perspicuity, in such a case, is the one thing needful; and it is better to make use of repetitions ten times repeated, than to leave any thing doubtful, which may be elucidated, even at the expense of what might seem tedious prolixity to persons, who feel no interest in subjects, which come "home to the business and bosoms" of the cultivators of the soil.

The Editor has sanguine hopes that he may be able to make the third volume of the New England Farmer more interesting and useful than either which has preceded it. As before observed, his correspondents are increasing, and other means of information are daily developing of which he will not neglect to avail himself for the benefit of his readers. He proposes in the course of the third volume to give a series of numbers on the management and diseases of Horses, Sheep, and Swine, principally extracted and abridged from authors of approved credit, and standard authority. These, taken in conjunction with the essays published in the first volume, under the head of "Diseases of Cattle" will compose an entire treatise on the management, improvement and diseases of the most useful and important kinds of animals.

The Editor and Proprietor of the New England Farmer, respectfully solicit the continued patronage of the friends to agricultural improvements; and would repeat a proposal formerly made, that every subscriber should condescend to consider himself an agent for the publisher, for the purpose of procuring other subscribers. Our subscription list, though respectable, as relates to number, and the characters of those, whose names compose it, is not yet so large as to give a requisite share of that kind of encouragement, which is the only permanent stimulus to long continued exertions. We enjoy the "Pleasures of Hope," but these, if too long deferred, may "make the heart sick," and the hand feeble; and we think that it is now nearly time for the delights of anticipation to give place to those of fruition. We apprehend that some of our friends may salute us with the unwelcome mandate, "Stop the paper from the end

of the present volume," but can assure them that those sounds are harsh and grating; and that we greatly prefer the salutation "Please to send to my address the New England Farmer, commencing with the third volume."

We have been requested, by a few of our subscribers to discontinue sending them the paper at the end of the present volume, although they have not paid their subscriptions. Those gentlemen are respectfully informed that it is a custom with printers not to discontinue their papers, till arrearages are paid.

The Index to the second volume will soon be completed and forwarded to those who have taken all the numbers.

LANDS IN PENNSYLVANIA. In the advertising part of this day's paper will be perceived an article with the signature of Robert H. Rose, which merits the particular notice of such of our young and enterprising cultivators as may be induced, either by choice or necessity, to leave the land of their nativity. If determined on such a step, we think that their chance is more promising in Pennsylvania, than farther to the South or West. The change of climate will not be so great as to threaten a northern constitution. The distance from their New England friends not such as to preclude occasional visits, and some degree of social intercourse. The modes of husbandry and state of society will be in a great degree similar to those to which such emigrants have been accustomed, and they will not be so far from navigable waters, good roads and markets, as to render their surplus produce of little value.

Boston Daily Advertiser.

FOREIGN.

Colombia.—Papers to the 6th of June have been received from Bogota. According to these the government of Colombia is making preparations to repel any invasion of their country, by Spain. In addition to the regular force of the country, 50,000 militia were ordered to be levied and disciplined for the field.

The latest accounts from Peru are to the end of March. Bolivar was concentrating a strong force in Trujillo. Three thousand troops had arrived from Panama and Guayaquil, and the Colombian Congress had decreed an additional reinforcement of 9000 men. It appears by a proclamation of Bolivar, that the Peruvians were jealous of the Colombian troops, sent for their protection, and considered their object to be the usurpation of their country. This he pronounces to be unjust; and that having liberated their country, "he will return to Colombia with his brother soldiers, without carrying even a grain of sand from Peru—leaving them their liberty." He regrets that the Peruvian Congress deemed it necessary to confer on him the odious authority of Dictator; and that nothing but the reservation of Peru, whose fate is so closely united with that of Colombia, could have induced him to accept what would have been treason, both to Colombia and Peru to have refused.

From the Pacific.—Commodore Hull has received a letter from several American Captains of vessels, dated Calao, March 1, 1824, giving an account of a mutiny by which the port was restored to the Spanish flag, and of the depredations of an unlicensed soldiery for twenty five days on their property, and expressing their expectation of the Commodore's presence there to represent them on the shore with the Spanish Chiefs, and to protect them against the Peruvian Admiral, who had treated them with outrage and insult. They mention that from the firing of Admiral Guise on their vessels, the China, one of the American ships, was in a sinking condition from a 24 pound shot which entered her below the water line, and before she could be righted so as to stop the leak, a great portion of her cargo was damaged, and perhaps ruined. She has detained, under his guns, the ship Providence, and the brig Herald, because they fired on his boats, when they came along side in the night, and refused to answer, when hailed.

They add, "we have a large amount of American property at stake, and we trust that you will come to our relief as soon as possible. Our cargoes for the most part are perishable, and we think we have a right to land them after having come so far to this our only market on this coast, and from the circumstance of being commenced discharging, while Callao was under the Patriot flag. This, Admiral Guise will not permit us to do, and we are most anxiously waiting for your presence, under the belief that our rights will be protected."

DOMESTIC.

The Author of M'Fingal.—A dinner was given in New York, on the 15th inst. to the venerated Judge Sumner, of Connecticut, author of the standard poem, M'Fingal. It was attended by the most eminent literary and scientific characters in that metropolis, among whom were Chancellor Kent, Dr. Mitchell, Judges Irving, Edwards, and Van Ness; Generals Morton and Swift; Colonels Gibbs, Pinkney, Alston, S. C. and Daines; Messrs. Gracie, Johnson, Catlin, Ward, Sedgwick, Selden, Sampson, Hallock, J. Coor, Verplank, Carter, Bleecker, A. Smith and Lawrence. A number of patriotic, sentimental and humorous toasts were drank, and the whole proceedings exhibited proof that a poet's honours in the United States are not of necessity posthumous.

Grand Canal.—There are calculated to be upwards of twelve hundred crafts employed on the New York canal.

From the Country.—"We have had an excellent season. One farmer within my knowledge, has got to his barn 110 tons of hay which was not wet by a drop of rain. The vines suffer from the dry spell, but the corn, potatoes, and the small grains promise well."—*Centinel.*

"In all our fields," says a Salem, N. J. paper, "we

hear not a murmur either about the worm or fly—the blast or mildew. Frequent and plentiful showers make the grass to grow, and the cattle to wax fat. Health and plenty are in our land. And, O Lord, for all this goodness let us praise thee."

A friend called the other day to mention a curious instance of combustion which took place in the hub of a cart wheel. The wheel was boxed, but the axle tree was not strained; it was newly tarred and went with a moderate load from Sinsbury to Wetung, six miles. It returned empty and was placed in a shed.—A fire was discovered from it the next morning, and the wheel and part of the cart body was burned. The barn and house of the owner narrowly escaped. The fire must have originated from the friction of the wheels having set fire to the tar.—*Conn. Mirror.*

Regues Caught.—On the night of the 16th inst. several articles of wearing apparel were stolen from the yard of Paul Whiting, Esq. in Northbridge, and on the next morning, the tracks of the naked feet were discovered leading from the yard, and were followed to this place, where they were lost, and no farther discovery was made at that time. But subsequently having heard that three negroes had been at Usbridge on the evening of the 16th, enquiring the way to Worcester and Brookfield, Col. Whiting was induced to renew his pursuit on the 19th. By enquiry he found that three persons, answering the description of those suspected, had passed the Sabbath in this town, dressed apparently in the very clothing taken from his yard, and that they had left the next morning on their way westward, whither he pursued and took them in Leicester, with the property which he had lost, in their possession.—Several other articles, supposed to have been stolen, were also found with them.

It has been reported that a sailor was knocked down and robbed by three blacks, in Southfield, last week. If so, it is not unlikely that the outrage was committed by the persons who are now in custody.—*Spy.*

Look out for Regues.—On Saturday night an attempt was made to rob the Silversmith's shop of Mr. Goodwin, kept in the second building of the Phoenix Bank in this city. The thieves succeeded in cutting through the wooden shutters, and in breaking a pane of glass they awoke a couple of boys who slept in the shop. Not knowing the cause of the noise they called out, when the thieves made off with one or two silver watches, which were found the next morning thrown into the State House yard.—*Conn. Courant.*

From New Orleans.—The steam ship Robert Fulton brought New Orleans papers of the 1st inst. The waters in the upper part of the Mississippi were rapidly rising at the last accounts. The Missouri, above its junction with the Mississippi, was five feet higher than ever before known. At St. Louis it was nine inches higher than last year, and still swelling. Rain had fallen continually for 10 days, and a great portion of the State of Illinois was reported to be inundated.—The Ohio was also on the rise. There was serious alarm at Natches and New Orleans, as the rising had commenced at the former place.

[N. York Statesman.]

Erratum.—In our last paper, in giving an account of the pedigree of the Herefordshire beifer, presented by Sir Isaac Coffin to the Massachusetts Agricultural Society, in page 408, column 1st, line 27th, the following sentence occurs:

"The Herefordshire Heifer is also from Waxey out of Stately—Stately out of Tidy, daughter of Mad Cap, which was considered the best cow in England, and the least bone, weighing eighteen score and a quarter." The word "and" should have been omitted.

PATENT STEEL SPRING HAY FORKS.

JUST received and for sale at the Agricultural Establishment, No. 20, Merchants' Row, a large supply of Goodwin's highly approved Patent Steel Spring Hay and Manure FORKS. Also, a few dozen very superior Rakes, Cam's cast steel Scythes, Dudley's warranted steel back do., Eisbee's cast steel polished Shovels—together with a great variety of other agricultural implements. June 12.

LANDS FOR SALE IN PENNSYLVANIA.

THE subscriber offers for sale in small lots to actual settlers, or in larger tracts to others, the following lands in the State of Pennsylvania, belonging to the estate of the late Wm. Ringham, viz: two hundred and fifty thousand acres in the counties of Bradford and Tioga, at from three dollars, to two dollars fifty cents per acre, according to situation; and five hundred thousand acres in the counties of Potter, McKean, Venango, Armstrong, Jefferson and Lycoming, at two dollars per acre. The terms are ten years for payments, three of them without interest. The land is generally of a good quality, well watered, intersected by important roads, and in a healthy situation. For further particulars application may be made to agents in the different counties, or to

ROBERT H. ROSE,

July 24. Silver Lake, Pennsylvania.

GIRL FROM 10 TO 14 YEARS OF AGE.

WANTED to take from the country a girl of the above age, and of a good disposition, until she is free.—Such an one will receive kind treatment, and be taught the rudiments of an English education—will have her board and clothing found her, and will be furnished when free, with two or three extra suits.—None need apply without good recommendations.—Inquire at this Office. July 17.

BY T. G. FESSENDEN.

"Let us do good unto all men."

Let us do good to all mankind,
For such is charity's behest,
Thus happiness we here shall find,
And be hereafter ever blest.

The benefits which we bestow
When honest indigence we aid,
If not required here below
In heaven will amply be repaid.

For unto men of liberal mind,
Friends to the needy and distressed,
The Great Bestower will be kind,
In blessing others they are blest.

Of wealth and power art thou possessed,
Remember whence the loan accrues,
That God appoints the poor distressed
To be receivers of his dues.

Of all that you possess below
Death may deprive you any hour,
But what you rightfully bestow,
Is placed beyond the tyrant's power.

'Tis yours to give the child of need,
His due supplies of earthly kind,
Likewise that "meat and drink indeed,"
Which nourishes the immortal mind.

'Tis yours to bid the needy know
Both how to live and how to die,
What gives them usefulness below,
And gains them happiness on high.

Nor moves the man in any sphere,
However limited or low,
Who cannot give at least the tear
Of sympathy to want and woe.

And sometimes sympathy is all,
Which e'en a Cressus could impart,
And drops, which dew at pity's call,
Are balm of Gilead to the heart.

O, then let all, be good to all,
For such is charity's behest,
Be never deaf to misery's call,
And thou in blessing shalt be blest.

Miscellany.

"CATCH A WEAZEL ASLEEP."

"Thy spirit, independence, let me share,
Lord of the lion heart and eagle eye;
Thy steps I follow with my bosom bare,
Nor heed the storm that howls along the sky."

A number of our ship carpenters, who recently turned out for higher wages, and a few sail-makers, hired a small sloop for the purpose of celebrating the fourth of July at the capes of the Delaware. On reaching the place, however, they were unable to realize their anticipated enjoyment, and being full of gin and independence, they, after weighty deliberation, resolved upon cruising in pursuit of adventures. Their stores were ample, and having appointed a "commander," they set sail with "bucyant hearts and spirits free as air."

After cruising for some time without success, the United States' schr. Weazel hove in view, and gave to the almost drooping spirits of their commodore the hope of accomplishing something worthy of himself. I shall not pretend to describe the soul-piercing flash that darted

through the mist of the liquor from his half-bunged eye, when he first beheld his destined prey, wounding the bosom of the amorous waters, that kissed the prow in sport and wantonness. Nor shall I describe the shout of joy which arose from the gullant crew, and rent the troubled air, when orders were given to "bear down upon her," and make her yield submissive to their power.

This order was promptly obeyed: up went the sails: each man to his post; and as the belligerent forces floated towards each other, there was

"A calm as still as death,
And the boldest held his breath
For a time."

But when within a musket shot, the *commodore*, with a degree of promptness which distinguishes our American commanders, ordered the schooner to send her papers aboard immediately, or dread impending ruin. Captain Zantinger, who was at a loss to understand the nature of the demand, manifested, as the *commodore* thought some reluctance in complying; when, in order to enforce obedience to this modest request, a musket was fired from the cabin window of the sloop. Captain Zantinger, unwilling that the *commodore* should have all the fun on his side, ordered a twelve pounder to be fired over them, and squared off to give a second broadside if necessary; but on the clearing up of the smoke, the pot-valour of our *commodore* evaporated, and he, with half his crew, were discovered on their knees, exclaiming, "as you are brave be merciful."

The boat was then sent aboard, not with papers, but with orders to bring the *commodore*, with his crew, aboard the schooner, where they were examined, and Captain Zantinger having satisfied himself that they were true and loyal citizens of this commonwealth, in pursuit of pleasure, after detaining them for four hours, permitted them to return to their sloop, on their promising that they would never attempt to "catch a weazel asleep again."—*Phil. Aurora*.

A "Fish Story."—One of the lads belonging to the T. H. Smith pilot boat informed us yesterday forenoon, that on his passage to Sandy Hook, he fell in with a whale about 80 feet long, and when near him he spouted into the air a large porpoise, which reached the distance of at least 10 feet. The porpoise fell head foremost, into the mouth of the whale, and was no doubt immediately swallowed.

New York Gazette.

A Wit in Chains.—On Thursday last a prisoner being placed at the bar at the Mayor's Court in Philadelphia, being called on to plead to an indictment for Larceny, was told by the Clerk to hold up his right hand. The man immediately held up his left hand—"hold your right hand" said the Clerk: "Please your honour" said the culprit, still keeping his left hand up. "Please your honour, I am left handed; and sure my right hand is on my left shoulder."

Medicine.—The Boston Medical Intelligencer says, "there is no doubt of the fact, that people take too much medicine; where ten actually die of acute disease, ten more are doctored to death at their own solicitation."

Philadelphia Society for Promoting Agriculture.

JOHN SCOTT, CHEMIST, late of Edinburgh, by his will, made in the Year 1816, bequeathed the sum of \$3000, in the funded 5 per cent Stock of the U. S. to the Corporation of the city of Philadelphia, to the intent "that the interest and dividends, to become receivable thereon, should be laid out in Premiums to be distributed among ingenious men and women, who make useful inventions, but no such premium to exceed \$50; and that therewith shall be given a Copper Medal with this inscription—"TO THE MOST DESERVING." The Select and Common Councils of the city of Philadelphia, have entrusted "the Philadelphia Society for promoting Agriculture," with the distribution of the aforesaid premiums and medals, and a Committee of that Society have been appointed to attend thereto. The subscribers named as that committee, give notice that they will receive applications for the same.

Certificates of the originality and utility of the inventions must accompany the applications, which may be directed "to the Committee of the Philadelphia Society for promoting Agriculture, on Scott's legacy," and forwarded free of expense, through the post office.

A description of the inventions, must be given in clear language, and correctly written, accompanied by drawings in perspective and detail, where necessary to illustrate it. Where the invention is a composition of matter, specimens of the ingredients and of the composition of matter sufficient in quantity for the purpose of experiment, and to preserve in the Cabinet of the Society will be expected.

Committee.

Imported Bull—SIR ISAAC.

THIS very fine young animal, just arrived from England is of the true *Hersfordshire* breed, having been presented to the "Massachusetts Society for promoting Agriculture," by Admiral Sir Isaac Coffin, together with a superb COW of the same breed. They have been placed by the Trustees on the Farm of John Prince, Esq. at Jamaica Plain, in Roxbury for one year. He will be permitted this autumn to go to but few cows at Three dollars each, which must be paid in advance.

As many persons, however, who have fine cows, do not wish to raise calves, Mr. P. will agree to take them at six weeks old, at their real value, and not charge for the use of the Bull.—The Trustees hope by this means, many more fine animals will be raised for public benefit. His colour is a beautiful *dunk red*.

The Pedigree which is furnished by one of the first breeders of this stock in England says, "He was got by Waxey—Waxey was by Trojan, which was challenged against any bull in England for 100 guineas. Waxey's Dam was Brunette out of Margaret. This bull's Dam is Young Charmer own sister to the *broken* or that won the premium at Bath, last Christmas, and afterwards was exhibited at Bristol for Show, and considered the fattest ox in the kingdom. Young Charmer was out of Old Charmer, killed at Hereford for the Christmas Show of fat Beef and was superior to any other." This pedigree might be extended further back, but it is considered unnecessary to persons who will view the animals.
